I User Documentation

1 Introduction
1.1 Overview of LAMMPS .............................................. 5
1.2 What does a LAMMPS version mean ................................ 6
1.3 LAMMPS features .................................................. 6
   1.3.1 General features ............................................ 6
   1.3.2 Particle and model types .................................. 7
   1.3.3 Interatomic potentials (force fields) ....................... 7
   1.3.4 Atom creation .............................................. 8
   1.3.5 Ensembles, constraints, and boundary conditions .......... 8
   1.3.6 Integrators ................................................ 9
   1.3.7 Diagnostics ............................................... 9
   1.3.8 Output .................................................. 9
   1.3.9 Multi-replica models ..................................... 9
   1.3.10 Pre- and post-processing ................................. 10
   1.3.11 Specialized features ................................... 10
1.4 LAMMPS non-features ............................................ 10
1.5 LAMMPS open-source license .................................... 12
1.6 Authors of LAMMPS ............................................. 12
1.7 Additional website links ......................................... 13

2 Install LAMMPS
2.1 Download an executable for Linux ............................... 15
   2.1.1 Pre-built Ubuntu Linux executables ....................... 15
   2.1.2 Pre-built Fedora Linux executables ...................... 16
   2.1.3 Pre-built EPEL Linux executable .......................... 17
   2.1.4 Pre-built OpenSuse Linux executable .................... 17
   2.1.5 Gentoo Linux executable ................................ 18
   2.1.6 Archlinux build-script .................................. 18
2.2 Download an executable for Mac ................................ 18
2.3 Download an executable for Windows ............................ 19
2.4 Download an executable for Linux or Mac via Conda ........... 19
2.5 Download source and documentation as a tarball ............... 20
2.6 Download the LAMMPS source with git .......................... 20
2.7 Applying patches ............................................. 22

3 Build LAMMPS
3.1 Build LAMMPS with CMake ..................................... 25
   3.1.1 Advantages of using CMake .............................. 25
   3.1.2 Getting started ......................................... 26
6.3.48 USER-INTEL package .......................................................... 138
6.3.49 USER-LB package ............................................................. 138
6.3.50 USER-MGPT package ......................................................... 139
6.3.51 USER-MISC package ........................................................ 139
6.3.52 USER-MANIFOLD package .................................................. 140
6.3.53 USER-MEAMC package ....................................................... 140
6.3.54 USER-MESODPD package ................................................... 141
6.3.55 USER-MESONT package ....................................................... 141
6.3.56 USER-MOFFF package ........................................................ 142
6.3.57 USER-MOLFILE package ...................................................... 142
6.3.58 USER-NETCDF package ....................................................... 143
6.3.59 USER-OMP package .......................................................... 143
6.3.60 USER-PHONON package ....................................................... 144
6.3.61 USER-PHONON package ....................................................... 145
6.3.62 USER-QMMM package ........................................................ 145
6.3.63 USER-QTB package ........................................................... 146
6.3.64 USER-QUIP package .......................................................... 146
6.3.65 USER-REACTION package .................................................... 147
6.3.66 USER-REAXC package ........................................................ 147
6.3.67 USER-SCAFACOS package ................................................... 148
6.3.68 USER-SDPD package .......................................................... 148
6.3.69 USER-SMD package ........................................................... 149
6.3.70 USER-SMTBQ package ........................................................ 149
6.3.71 USER-SPH package ............................................................ 150
6.3.72 USER-TALLY package ......................................................... 150
6.3.73 USER-UEF package ............................................................ 150
6.3.74 USER-VTK package ............................................................ 151
6.3.75 USER-YAFF package ........................................................... 151

7 Accelerate performance .......................... 153
7.1 Benchmarks ................................................................. 153
7.2 Measuring performance .................................................. 154
7.3 General tips ................................................................. 155
7.4 Accelerator packages ..................................................... 156
7.4.1 GPU package ................................................................. 157
7.4.2 USER-INTEL package ....................................................... 159
7.4.3 KOKKOS package ........................................................... 167
7.4.4 USER-OMP package ........................................................ 173
7.4.5 OPT package ................................................................. 176
7.5 Comparison of various accelerator packages .................. 179

8 Howto discussions .................. 181
8.1 Tutorials howto ............................................................ 181
8.1.1 Using CMake with LAMMPS tutorial .................................. 181
8.1.2 LAMMPS GitHub tutorial ................................................... 188
8.1.3 PyLammps Tutorial .......................................................... 200
8.1.4 Using LAMMPS on Windows 10 with WSL .......................... 213
8.2 General howto ............................................................... 223
8.2.1 Restart a simulation ......................................................... 223
8.2.2 Visualize LAMMPS snapshots ............................................. 224
8.2.3 Run multiple simulations from one input script .................. 224
8.2.4 Multi-replica simulations ................................................... 226
8.2.5 Library interface to LAMMPS .............................................. 226
8.2.6 Coupling LAMMPS to other codes ....................................... 227
### Table of Contents

8.2.7 Using LAMMPS in client/server mode ......................................................... 228

8.3 Settings howto ................................................................................................ 230
8.3.1 2d simulations ........................................................................................... 230
8.3.2 Triclinic (non-orthogonal) simulation boxes ............................................... 230
8.3.3 Thermostats ................................................................................................ 233
8.3.4 Barostats ..................................................................................................... 235
8.3.5 Walls ........................................................................................................... 236
8.3.6 NEMD simulations ....................................................................................... 237
8.3.7 Long-range dispersion settings .................................................................... 237

8.4 Analysis howto ............................................................................................... 238
8.4.1 Output from LAMMPS (thermo, dumps, computes, fixes, variables) ........... 238
8.4.2 Use chunks to calculate system properties .................................................... 243
8.4.3 Calculate temperature .................................................................................. 246
8.4.4 Calculate elastic constants .......................................................................... 247
8.4.5 Calculate thermal conductivity ................................................................. 247
8.4.6 Calculate viscosity ...................................................................................... 248
8.4.7 Calculate diffusion coefficients ................................................................... 250

8.5 Force fields howto .......................................................................................... 251
8.5.1 CHARMM, AMBER, COMPASS, and DREIDING force fields ............... 251
8.5.2 TIP3P water model ..................................................................................... 253
8.5.3 TIP4P water model ..................................................................................... 254
8.5.4 SPC water model ....................................................................................... 256

8.6 Packages howto ............................................................................................. 257
8.6.1 Finite-size spherical and aspherical particles ............................................... 257
8.6.2 Granular models ......................................................................................... 260
8.6.3 Body particles ............................................................................................. 261
8.6.4 Polarizable models ...................................................................................... 267
8.6.5 Adiabatic core/shell model ......................................................................... 268
8.6.6 Drude induced dipoles ............................................................................... 271
8.6.7 Tutorial for Thermalized Drude oscillators in LAMMPS ............................. 272
8.6.8 Manifolds (surfaces) ................................................................................... 278
8.6.9 Magnetic spins ........................................................................................... 279

9 Example scripts ............................................................................................... 281
9.1 Lowercase directories ...................................................................................... 281
9.2 Uppercase directories ..................................................................................... 283

10 Auxiliary tools ............................................................................................... 285
10.1 Pre-processing tools ...................................................................................... 285
10.2 Post-processing tools ..................................................................................... 285
10.3 Miscellaneous tools ....................................................................................... 286
10.4 Tool descriptions ........................................................................................... 286
10.4.1 amber2lmp tool ....................................................................................... 286
10.4.2 binary2txt tool ......................................................................................... 286
10.4.3 ch2lmp tool .............................................................................................. 286
10.4.4 chain tool ................................................................................................. 287
10.4.5 CMake tools ............................................................................................ 287
10.4.6 colvars tools ............................................................................................. 287
10.4.7 createatoms tool ....................................................................................... 288
10.4.8 drude tool ................................................................................................. 288
10.4.9 eam database tool .................................................................................... 288
10.4.10 eam generate tool .................................................................................... 288
10.4.11 eff tool .................................................................................................... 288
10.4.12 emacs tool .............................................................................................. 289
# 16 LAMMPS Developer Guide

16.1 LAMMPS source files .................................................. 479
16.2 LAMMPS class topology ............................................... 480
16.3 How a timestep works ................................................ 483
16.4 Writing LAMMPS styles .............................................. 486
16.4.1 Writing a new fix style .......................................... 486
16.5 LAMMPS utility functions .......................................... 490
16.5.1 I/O with status check ............................................ 490
16.5.2 String to number conversions with validity check .... 491
16.5.3 String processing .................................................. 492
16.5.4 File and path functions ....................................... 494
16.5.5 Potential file functions ....................................... 495
16.5.6 Argument processing .......................................... 496
16.5.7 Convenience functions ...................................... 497
16.5.8 Customized standard functions ............................. 498
16.6 Communication buffer coding with `ubuf` .................... 499
16.7 Tokenizer classes ................................................... 500
16.8 File reader classes .................................................. 504
16.9 Memory pool classes ............................................... 508
16.10 Eigensolver functions ............................................ 512
16.11 LAMMPS C++ base classes ..................................... 512
16.11.1 LAMMPS Class .................................................. 513
16.11.2 LAMMPS Atom and AtomVec Base Classes ............. 514
16.11.3 LAMMPS Input Base Class ................................ 516

# 17 Commands

17.1 `angle_coeff` command ........................................... 519
17.1.1 Syntax .......................................................... 519
17.1.2 Examples ....................................................... 519
17.1.3 Description ..................................................... 519
17.1.4 Restrictions .................................................... 520
17.1.5 Related commands .......................................... 520
17.1.6 Default ........................................................ 520
17.2 `angle_style` command ........................................... 520
17.2.1 Syntax .......................................................... 520
17.2.2 Examples ....................................................... 520
17.2.3 Description ..................................................... 521
17.2.4 Restrictions .................................................... 522
17.2.5 Related commands .......................................... 522
17.2.6 Default ........................................................ 522
17.3 `atom_modify` command ........................................... 522
17.3.1 Syntax .......................................................... 522
17.3.2 Examples ....................................................... 523
17.3.3 Description ..................................................... 523
17.3.4 Restrictions .................................................... 524
17.3.5 Related commands .......................................... 524
17.3.6 Default ........................................................ 524
17.4 `atom_style` command ........................................... 525
17.4.1 Syntax .......................................................... 525
17.4.2 Examples ....................................................... 525
17.4.3 Description ..................................................... 525
17.4.4 Restrictions .................................................... 528
17.4.5 Related commands .......................................... 529
17.4.6 Default ........................................................ 529
17.21.1 Syntax .................................................. 574
17.21.2 Examples ............................................... 574
17.21.3 Description ........................................... 574
17.21.4 Restrictions .......................................... 575
17.21.5 Related commands ................................... 575
17.21.6 Default ................................................ 575
17.22 dielectric command ..................................... 575
17.22.1 Syntax .................................................. 575
17.22.2 Examples ............................................... 575
17.22.3 Description ........................................... 575
17.22.4 Restrictions .......................................... 576
17.22.5 Related commands ................................... 576
17.22.6 Default ................................................ 576
17.23 dihedral_coeff command ......................... 576
17.23.1 Syntax .................................................. 576
17.23.2 Examples ............................................... 576
17.23.3 Description ........................................... 576
17.23.4 Restrictions .......................................... 577
17.23.5 Related commands ................................... 577
17.23.6 Default ................................................ 577
17.24 dihedral_style command ....................... 577
17.24.1 Syntax .................................................. 577
17.24.2 Examples ............................................... 577
17.24.3 Description ........................................... 577
17.24.4 Restrictions .......................................... 578
17.24.5 Related commands ................................... 578
17.24.6 Default ................................................ 578
17.25 dimension command .................................. 578
17.25.1 Syntax .................................................. 578
17.25.2 Examples ............................................... 578
17.25.3 Description ........................................... 578
17.25.4 Restrictions .......................................... 579
17.25.5 Related commands ................................... 579
17.25.6 Default ................................................ 579
17.26 displace_atoms command ....................... 579
17.26.1 Syntax .................................................. 579
17.26.2 Examples ............................................... 580
17.26.3 Description ........................................... 580
17.26.4 Restrictions .......................................... 580
17.26.5 Related commands ................................... 580
17.26.6 Default ................................................ 580
17.27 dump command ......................................... 580
17.28 dump vtk command .................................... 580
17.29 dump h5md command ................................. 580
17.30 dump molfile command .............................. 580
17.31 dump netcdf command ............................... 580
17.32 dump image command ................................. 580
17.33 dump movie command ................................. 580
17.34 dump atom/adios command ................. 580

LAMMPS stands for Large-scale Atomic/Molecular Massively Parallel Simulator.

LAMMPS is a classical molecular dynamics simulation code with a focus on materials modeling. It was designed to run efficiently on parallel computers. It was developed originally at Sandia National Laboratories, a US Department of Energy facility. The majority of funding for LAMMPS has come from the US Department of Energy (DOE). LAMMPS is an open-source code, distributed freely under the terms of the GNU Public License (GPL).

The LAMMPS website has a variety of information about the code. It includes links to an on-line version of this manual, a mailing list where users can post questions, and a GitHub site where all LAMMPS development is coordinated.

The content for this manual is part of the LAMMPS distribution. You can build a local copy of the Manual as HTML pages or a PDF file, by following the steps on the Manual build doc page. The manual is organized in two parts: 1) A User documentation for how to install and use LAMMPS and 2) a Programmer documentation for how to write programs using the LAMMPS library or how to modify LAMMPS.

Once you are familiar with LAMMPS, you may want to bookmark this page since it gives quick access to a doc page for every LAMMPS command.
Part I

User Documentation
These pages provide a brief introduction to LAMMPS.

1.1 Overview of LAMMPS

LAMMPS is a classical molecular dynamics (MD) code that models ensembles of particles in a liquid, solid, or gaseous state. It can model atomic, polymeric, biological, solid-state (metals, ceramics, oxides), granular, coarse-grained, or macroscopic systems using a variety of interatomic potentials (force fields) and boundary conditions. It can model 2d or 3d systems with only a few particles up to millions or billions.

LAMMPS can be built and run on a laptop or desktop machine, but is designed for parallel computers. It will run on any parallel machine that supports the MPI message-passing library. This includes shared-memory boxes and distributed-memory clusters and supercomputers.

LAMMPS is written in C++. Earlier versions were written in F77 and F90. See the History page of the website for details. All versions can be downloaded from the LAMMPS website.

LAMMPS is designed to be easy to modify or extend with new capabilities, such as new force fields, atom types, boundary conditions, or diagnostics. See the Modify doc page for more details.

In the most general sense, LAMMPS integrates Newton’s equations of motion for a collection of interacting particles. A single particle can be an atom or molecule or electron, a coarse-grained cluster of atoms, or a mesoscopic or macroscopic clump of material. The interaction models that LAMMPS includes are mostly short-range in nature; some long-range models are included as well.

LAMMPS uses neighbor lists to keep track of nearby particles. The lists are optimized for systems with particles that are repulsive at short distances, so that the local density of particles never becomes too large. This is in contrast to methods used for modeling plasma or gravitational bodies (e.g. galaxy formation).

On parallel machines, LAMMPS uses spatial-decomposition techniques to partition the simulation domain into small sub-domains of equal computational cost, one of which is assigned to each processor. Processors communicate and store “ghost” atom information for atoms that border their sub-domain.
1.2 What does a LAMMPS version mean

The LAMMPS “version” is the date when it was released, such as 1 May 2014. LAMMPS is updated continuously. Whenever we fix a bug or add a feature, we release it in the next patch release, which are typically made every couple of weeks. Info on patch releases are on this website page. Every few months, the latest patch release is subjected to more thorough testing and labeled as a stable version.

Each version of LAMMPS contains all the features and bug-fixes up to and including its version date. The version date is printed to the screen and logfile every time you run LAMMPS. It is also in the file src/version.h and in the LAMMPS directory name created when you unpack a tarball. And it is on the first page of the manual.

- If you browse the HTML doc pages on the LAMMPS WWW site, they always describe the most current patch release of LAMMPS.
- If you browse the HTML doc pages included in your tarball, they describe the version you have, which may be older.

1.3 LAMMPS features

LAMMPS is a classical molecular dynamics (MD) code with these general classes of functionality:

1. General features
2. Particle and model types
3. Interatomic potentials (force fields)
4. Atom creation
5. Ensembles, constraints, and boundary conditions
6. Integrators
7. Diagnostics
8. Output
9. Multi-replica models
10. Pre- and post-processing
11. Specialized features (beyond MD itself)

1.3.1 General features

- runs on a single processor or in parallel
- distributed-memory message-passing parallelism (MPI)
- spatial-decomposition of simulation domain for parallelism
- open-source distribution
- highly portable C++
- optional libraries used: MPI and single-processor FFT
- GPU (CUDA and OpenCL), Intel Xeon Phi, and OpenMP support for many code features
• easy to extend with new features and functionality
• runs from an input script
• syntax for defining and using variables and formulas
• syntax for looping over runs and breaking out of loops
• run one or multiple simulations simultaneously (in parallel) from one script
• build as library, invoke LAMMPS through library interface or provided Python wrapper
• couple with other codes: LAMMPS calls other code, other code calls LAMMPS, umbrella code calls both

1.3.2 Particle and model types

(atom style command)
• atoms
• coarse-grained particles (e.g. bead-spring polymers)
• united-atom polymers or organic molecules
• all-atom polymers, organic molecules, proteins, DNA
• metals
• granular materials
• coarse-grained mesoscale models
• finite-size spherical and ellipsoidal particles
• finite-size line segment (2d) and triangle (3d) particles
• point dipole particles
• rigid collections of particles
• hybrid combinations of these

1.3.3 Interatomic potentials (force fields)

(pair style, bond style, angle style, dihedral style, improper style, kspace style commands)
• pairwise potentials: Lennard-Jones, Buckingham, Morse, Born-Mayer-Huggins, Yukawa, soft, class 2 (COMPASS), hydrogen bond, tabulated
• charged pairwise potentials: Coulombic, point-dipole
• many-body potentials: EAM, Finnis/Sinclair EAM, modified EAM (MEAM), embedded ion method (EIM), EDIP, ADP, Stillinger-Weber, Tersoff, REBO, AIREBO, ReaxFF, COMB, SNAP, Streitz-Mintmire, 3-body polymorphic
• long-range interactions for charge, point-dipoles, and LJ dispersion: Ewald, Wolf, PPPM (similar to particle-mesh Ewald)
• polarization models: QEq, core/shell model, Drude dipole model
• charge equilibration (QEq via dynamic, point, shielded, Slater methods)
• coarse-grained potentials: DPD, GayBerne, RESquared, colloidal, DLVO
• mesoscopic potentials: granular, Peridynamics, SPH
• electron force field (eFF, AWPMD)
• bond potentials: harmonic, FENE, Morse, nonlinear, class 2, quartic (breakable)
• angle potentials: harmonic, CHARMM, cosine, cosine/squared, cosine/periodic, class 2 (COMPASS)
• dihedral potentials: harmonic, CHARMM, multi-harmonic, helix, class 2 (COMPASS), OPLS
• improper potentials: harmonic, cvff, umbrella, class 2 (COMPASS)
• polymer potentials: all-atom, united-atom, bead-spring, breakable
• water potentials: TIP3P, TIP4P, SPC
• implicit solvent potentials: hydrodynamic lubrication, Debye
• force-field compatibility with common CHARMM, AMBER, DREIDING, OPLS, GROMACS, COMPASS options
• access to the OpenKIM Repository of potentials via kim_init, kim_interactions, and kim_query commands
• hybrid potentials: multiple pair, bond, angle, dihedral, improper potentials can be used in one simulation
• overlaid potentials: superposition of multiple pair potentials

1.3.4 Atom creation

(read_data, lattice, create_atoms, delete_atoms, displace_atoms, replicate commands)

• read in atom coords from files
• create atoms on one or more lattices (e.g. grain boundaries)
• delete geometric or logical groups of atoms (e.g. voids)
• replicate existing atoms multiple times
• displace atoms

1.3.5 Ensembles, constraints, and boundary conditions

(fix command)

• 2d or 3d systems
• orthogonal or non-orthogonal (triclinic symmetry) simulation domains
• constant NVE, NVT, NPT, NPH, Parrinello/Rahman integrators
• thermostating options for groups and geometric regions of atoms
• pressure control via Nose/Hoover or Berendsen barostatting in 1 to 3 dimensions
• simulation box deformation (tensile and shear)
• harmonic (umbrella) constraint forces
• rigid body constraints
• SHAKE bond and angle constraints
• Monte Carlo bond breaking, formation, swapping
• atom/molecule insertion and deletion
• walls of various kinds
• non-equilibrium molecular dynamics (NEMD)
• variety of additional boundary conditions and constraints

1.3.6 Integrators

(run, run_style, minimize commands)
• velocity-Verlet integrator
• Brownian dynamics
• rigid body integration
• energy minimization via conjugate gradient or steepest descent relaxation
• rRESPA hierarchical timestepping
• rerun command for post-processing of dump files

1.3.7 Diagnostics

• see various flavors of the fix and compute commands

1.3.8 Output

(dump, restart commands)
• log file of thermodynamic info
• text dump files of atom coords, velocities, other per-atom quantities
• binary restart files
• parallel I/O of dump and restart files
• per-atom quantities (energy, stress, centro-symmetry parameter, CNA, etc)
• user-defined system-wide (log file) or per-atom (dump file) calculations
• spatial and time averaging of per-atom quantities
• time averaging of system-wide quantities
• atom snapshots in native, XYZ, XTC, DCD, CFG formats

1.3.9 Multi-replica models

• nudged elastic band
• parallel replica dynamics
• temperature accelerated dynamics
• parallel tempering
1.3.10 Pre- and post-processing

- A handful of pre- and post-processing tools are packaged with LAMMPS, some of which can convert input and output files to/from formats used by other codes; see the Tools doc page.

- Our group has also written and released a separate toolkit called Pizza.py which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations. Pizza.py is written in Python and is available for download from the Pizza.py WWW site.

1.3.11 Specialized features

LAMMPS can be built with optional packages which implement a variety of additional capabilities. See the Optional Packages page for details.

These are LAMMPS capabilities which you may not think of as typical classical MD options:

- static and dynamic load-balancing
- generalized aspherical particles
- stochastic rotation dynamics (SRD)
- real-time visualization and interactive MD
- calculate virtual diffraction patterns
- atom-to-continuum coupling with finite elements
- coupled rigid body integration via the POEMS library
- QM/MM coupling
- Monte Carlo via GCMC and tfMC and atom swapping
- path-integral molecular dynamics (PIMD) and this as well
- Direct Simulation Monte Carlo for low-density fluids
- Peridynamics modeling
- Lattice Boltzmann fluid
- targeted and steered molecular dynamics
- two-temperature electron model

1.4 LAMMPS non-features

LAMMPS is designed to be a fast, parallel engine for molecular dynamics (MD) simulations. It provides only a modest amount of functionality for setting up simulations and analyzing their output.

Specifically, LAMMPS was not conceived and designed for:

- being run through a GUI
- building molecular systems, or building molecular topologies
- assign force-field coefficients automagically
- perform sophisticated analysis of your MD simulation
- visualize your MD simulation interactively
• plot your output data

Over the years some of these limitations have been reduced or removed, through features added to LAMMPS or external tools that either closely interface with LAMMPS or extend LAMMPS.

Here are suggestions on how to perform these tasks:

• **GUI**: LAMMPS can be built as a library and a Python wrapper that wraps the library interface is provided. Thus, GUI interfaces can be written in Python (or C or C++ if desired) that run LAMMPS and visualize or plot its output. Examples of this are provided in the python directory and described on the Python doc page. Also, there are several external wrappers or GUI front ends.

• **Builder**: Several pre-processing tools are packaged with LAMMPS. Some of them convert input files in formats produced by other MD codes such as CHARMM, AMBER, or Insight into LAMMPS input formats. Some of them are simple programs that will build simple molecular systems, such as linear bead-spring polymer chains. The moltemplate program is a true molecular builder that will generate complex molecular models. See the Tools doc page for details on tools packaged with LAMMPS. The Pre/post processing page of the LAMMPS website describes a variety of third party tools for this task. Furthermore, some LAMMPS internal commands allow to reconstruct, or selectively add topology information, as well as provide the option to insert molecule templates instead of atoms for building bulk molecular systems.

• **Force-field assignment**: The conversion tools described in the previous bullet for CHARMM, AMBER, and Insight will also assign force field coefficients in the LAMMPS format, assuming you provide CHARMM, AMBER, or BIOVIA (formerly Accelrys) force field files. The tools ParmEd and InterMol are particularly powerful and flexible in converting force field and topology data between various MD simulation programs.

• **Simulation analysis**: If you want to perform analysis on-the-fly as your simulation runs, see the compute and fix doc pages, which list commands that can be used in a LAMMPS input script. Also see the Modify doc page for info on how to add your own analysis code or algorithms to LAMMPS. For post-processing, LAMMPS output such as dump file snapshots can be converted into formats used by other MD or post-processing codes. To some degree, that conversion can be done directly inside of LAMMPS by interfacing to the VMD moffile plugins. The rerun command also allows to do some post-processing of existing trajectories, and through being able to read a variety of file formats, this can also be used for analyzing trajectories from other MD codes. Some post-processing tools packaged with LAMMPS will do these conversions. Scripts provided in the tools/python directory can extract and massage data in dump files to make it easier to import into other programs. See the Tools doc page for details on these various options.

• **Visualization**: LAMMPS can produce NETPBM, JPG or PNG snapshot images on-the-fly via its dump image command and pass them to an external program, FFmpeg to generate movies from them. For high-quality, interactive visualization there are many excellent and free tools available. See the Visualization Tools page of the LAMMPS website for visualization packages that can process LAMMPS output data.

• **Plotting**: See the next bullet about Pizza.py as well as the Python doc page for examples of plotting LAMMPS output. Scripts provided with the python tool in the tools directory will extract and massage data in log and dump files to make it easier to analyze and plot. See the Tools doc page for more discussion of the various tools.

• **Pizza.py**: Our group has also written a separate toolkit called Pizza.py which can do certain kinds of setup, analysis, plotting, and visualization (via OpenGL) for LAMMPS simulations. It thus provides some functionality for several of the above bullets. Pizza.py is written in Python and is available for download from this page.
1.5 LAMMPS open-source license

LAMMPS is a freely-available open-source code, distributed under the terms of the GNU Public License, which means you can use or modify the code however you wish.

LAMMPS comes with no warranty of any kind. As each source file states in its header, it is a copyrighted code that is distributed free-of-charge, under the terms of the GNU Public License (GPL). This is often referred to as open-source distribution - see www.gnu.org or www.opensource.org. The legal text of the GPL is in the LICENSE file included in the LAMMPS distribution.

Here is a summary of what the GPL means for LAMMPS users:

(1) Anyone is free to use, modify, or extend LAMMPS in any way they choose, including for commercial purposes.

(2) If you distribute a modified version of LAMMPS, it must remain open-source, meaning you distribute it under the terms of the GPL. You should clearly annotate such a code as a derivative version of LAMMPS.

(3) If you release any code that includes LAMMPS source code, then it must also be open-sourced, meaning you distribute it under the terms of the GPL.

(4) If you give LAMMPS files to someone else, the GPL LICENSE file and source file headers (including the copyright and GPL notices) should remain part of the code.

1.6 Authors of LAMMPS

The primary LAMMPS developers are at Sandia National Labs and Temple University:

- Steve Plimpton, sjplimp at sandia.gov
- Aidan Thompson, athomps at sandia.gov
- Stan Moore, stamoor at sandia.gov
- Axel Kohlmeyer, akohlmey at gmail.com
- Richard Berger, richard.berger at temple.edu

Past developers include Paul Crozier and Mark Stevens, both at Sandia, and Ray Shan, now at Materials Design.

The Authors page of the LAMMPS website has a comprehensive list of all the individuals who have contributed code for a new feature or command or tool to LAMMPS.

The following folks deserve special recognition. Many of the packages they have written are unique for an MD code and LAMMPS would not be as general-purpose as it is without their expertise and efforts.

- Metin Aktulga (MSU), USER-REAXC package for C version of ReaxFF
- Mike Brown (Intel), GPU and USER-INTEL packages
- Colin Denniston (U Western Ontario), USER-LB package
- Georg Ganzenmuller (EMI), USER-SMD and USER-SPH packages
- Andres Jaramillo-Botero (Caltech), USER-EFF package for electron force field
- Reese Jones (Sandia) and colleagues, USER-ATC package for atom/continuum coupling
- Christoph Kloss (DCS Computing), LIGGGHTS code for granular materials, built on top of LAMMPS
- Rudra Mukherjee (JPL), POEMS package for articulated rigid body motion
• Trung Ngyuen (Northwestern U), GPU and RIGID and BODY packages
• Mike Parks (Sandia), PERI package for Peridynamics
• Roy Pollock (LLNL), Ewald and PPPM solvers
• Christian Trott (Sandia), USER-CUDA and KOKKOS packages
• Ilya Valuev (JIHT), USER-AWPMD package for wave packet MD
• Greg Wagner (Northwestern U), MEAM package for MEAM potential

As discussed on the History page of the website, LAMMPS originated as a cooperative project between DOE labs and industrial partners. Folks involved in the design and testing of the original version of LAMMPS were the following:

• John Carpenter (Mayo Clinic, formerly at Cray Research)
• Terry Stouch (Lexicon Pharmaceuticals, formerly at Bristol Myers Squibb)
• Steve Lustig (Dupont)
• Jim Belak and Roy Pollock (LLNL)

1.7 Additional website links

The LAMMPS website has a variety of additional info about LAMMPS, beyond what is in this manual. Some other useful resources available online are listed below.

• Brief intro and recently added significant features
• List of features
• List of non-features
• Recent bug fixes and new features
• Download info
• GitHub site
• SourceForge site
• LAMMPS open-source license
• Glossary of terms relevant to LAMMPS
• LAMMPS highlights with images
• LAMMPS highlights with movies
• Mail list
• Workshops
• Tutorials
• Pre- and post-processing tools for LAMMPS
• Other software usable with LAMMPS
• Viz tools usable with LAMMPS
• Benchmark performance
• Publications that have cited LAMMPS
• Authors of LAMMPS
• History of LAMMPS development
• Funding for LAMMPS
You can download LAMMPS as an executable or as source code.

With source code, you also have to build LAMMPS. But you have more flexibility as to what features to include or exclude in the build. If you plan to modify or extend LAMMPS, then you need the source code.

### 2.1 Download an executable for Linux

Binaries are available for different versions of Linux:

- **Pre-built Ubuntu Linux executables**
- **Pre-built Fedora Linux executables**
- **Pre-built EPEL Linux executables (RHEL, CentOS)**
- **Pre-built OpenSuse Linux executables**
- **Gentoo Linux executable**
- **Arch Linux build-script**

#### 2.1.1 Pre-built Ubuntu Linux executables

A pre-built LAMMPS executable suitable for running on the latest Ubuntu Linux versions, can be downloaded as a Debian package. This allows you to install LAMMPS with a single command, and stay up-to-date with the current stable version of LAMMPS by simply updating your operating system. Please note, that the repository below offers two LAMMPS packages, lammps-daily and lammps-stable. The LAMMPS developers recommend to use the lammps-stable package for any production simulations. The lammps-daily package is built from the LAMMPS development sources, and those versions may have known issues and bugs when new features are added and the software has not undergone full release testing.

To install the appropriate personal-package archives (PPAs), do the following once:

```bash
$ sudo add-apt-repository ppa:gladky-anton/lammps
$ sudo add-apt-repository ppa:openkim/latest
$ sudo apt-get update
```

To install LAMMPS do the following once:
$ sudo apt-get install lammps-stable

This downloads an executable named lmp_stable to your box, which can then be used in the usual way to run input scripts:

$ lmp_stable -in in.lj

To update LAMMPS to the most current stable version, do the following:

$ sudo apt-get update

which will also update other packages on your system.

To get a copy of the current documentation and examples:

$ sudo apt-get install lammps-stable-doc

which will download the doc files in /usr/share/doc/lammps-stable-doc/doc and example problems in /usr/share/doc/lammps-doc/examples.

To get a copy of the current potentials files:

$ sudo apt-get install lammps-stable-data

which will download the potentials files to /usr/share/lammps-stable/potentials. The lmp_stable binary is hard-coded to look for potential files in this directory (it does not use the LAMMPS_POTENTIALS environment variable, as described in pair_coeff command).

The lmp_stable binary is built with the KIM package which results in the above command also installing the kim-api binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the openkim-models package

$ sudo apt-get install openkim-models

To un-install LAMMPS, do the following:

$ sudo apt-get remove lammps-stable

Please use lmp_stable -help to see which compilation options, packages, and styles are included in the binary.

Thanks to Anton Gladky (gladky.anton at gmail.com) for setting up this Ubuntu package capability.

### 2.1.2 Pre-built Fedora Linux executables

Pre-built LAMMPS packages for stable releases are available in the Fedora Linux distribution as of version 28. The packages can be installed via the dnf package manager. There are 3 basic varieties (lammps = no MPI, lammps-mpich = MPICH MPI library, lammps-openmpi = OpenMPI MPI library) and for each support for linking to the C library interface (lammps-devel, lammps-mpich-devel, lammps-openmpi-devel), the header for compiling programs using the C library interface (lammps-headers), and the LAMMPS python module for Python 3. All packages can be installed at the same time and the name of the LAMMPS executable is lmp and lmp_openmpi or lmp_mpich respectively. By default, lmp will refer to the serial executable, unless one of the MPI environment modules is loaded (module load mpi/mpich-x86_64 or module load mpi/openmpi-x86_64). Then the corresponding parallel LAMMPS executable can be used. The same mechanism applies when loading the LAMMPS python module.

To install LAMMPS with OpenMPI and run an input in.lj with 2 CPUs do:
$ dnf install lammps-openmpi
$ module load mpi/openmpi-x86_64
$ mpirun -np 2 lmp -in in.lj

The `dnf install` command is needed only once. In case of a new LAMMPS stable release, `dnf update` will automatically update to the newer version as soon at the RPM files are built and uploaded to the download mirrors. The `module load` command is needed once per (shell) session or shell terminal instance, unless it is automatically loaded from the shell profile.

The LAMMPS binary is built with the KIM package which results in the above command also installing the kim-api binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the openkim-models package

$ dnf install openkim-models

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in Fedora.

### 2.1.3 Pre-built EPEL Linux executable

Pre-built LAMMPS (and KIM) packages for stable releases are available in the Extra Packages for Enterprise Linux (EPEL) repository for use with Red Hat Enterprise Linux (RHEL) or CentOS version 7.x and compatible Linux distributions. Names of packages, executable, and content are the same as described above for Fedora Linux. But RHEL/CentOS 7.x uses the `yum` package manager instead of `dnf` in Fedora 28.

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in EPEL.

### 2.1.4 Pre-built OpenSuse Linux executable

A pre-built LAMMPS package for stable releases is available in OpenSuse as of Leap 15.0. You can install the package with:

$ zypper install lammps

This includes support for OpenMPI. The name of the LAMMPS executable is `lmp`. Thus to run an input in parallel on 2 CPUs you would do:

$ mpirun -np 2 lmp -in in.lj

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

The LAMMPS binary is built with the KIM package which results in the above command also installing the kim-api binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the openkim-models package

$ zypper install openkim-models

Thanks to Christoph Junghans (LANL) for making LAMMPS available in OpenSuse.
2.1.5 Gentoo Linux executable

LAMMPS is part of Gentoo’s main package tree and can be installed by typing:

```
% emerge --ask lammps
```

Note that in Gentoo the LAMMPS source is downloaded and the package is built on your machine. Certain LAMMPS packages can be enable via USE flags, type

```
% equery uses lammps
```

for details.

Thanks to Nicolas Bock and Christoph Junghans (LANL) for setting up this Gentoo capability.

2.1.6 Archlinux build-script

LAMMPS is available via Arch’s unofficial Arch User repository (AUR). There are three scripts available, named lammps, lammps-beta and lammps-git. They respectively package the stable, patch and git releases.

To install, you will need to have the git package installed. You may use any of the above names in-place of lammps.

```
$ git clone https://aur.archlinux.org/lammps.git
$ cd lammps
$ makepkg -s
$ makepkg -i
```

To update, you may repeat the above, or change into the cloned directory, and execute the following, after which, if there are any changes, you may use makepkg as above.

```
$ git pull
```

Alternatively, you may use an AUR helper to install these packages.

Note that the AUR provides build-scripts that download the source and the build the package on your machine.

2.2 Download an executable for Mac

LAMMPS can be downloaded, built, and configured for OS X on a Mac with Homebrew. (Alternatively, see the install instructions for Download an executable via Conda.) The following LAMMPS packages are unavailable at this time because of additional needs not yet met: GPU, KOKKOS, LATTE, MSCG, MESSAGE, MPIIO POEMS VORONOI.

After installing Homebrew, you can install LAMMPS on your system with the following commands:

```
% brew install lammps
```

This will install the executables “lammps_serial” and “lammps_mpi”, as well as the LAMMPS “doc”, “potentials”, “tools”, “bench”, and “examples” directories.

Once LAMMPS is installed, you can test the installation with the Lennard-Jones benchmark file:

```
% brew test lammps -v
```
The LAMMPS binary is built with the KIM package which results in Homebrew also installing the kim-api binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the openkim-models package

```
brew install openkim-models
```

If you have problems with the installation you can post issues to this link.

Thanks to Derek Thomas (derekt at cello.t.u-tokyo.ac.jp) for setting up the Homebrew capability.

## 2.3 Download an executable for Windows

Pre-compiled Windows installers which install LAMMPS executables on a Windows system can be downloaded from this site:

http://packages.lammps.org/windows.html

Note that each installer package has a date in its name, which corresponds to the LAMMPS version of the same date. Installers for current and older versions of LAMMPS are available. 32-bit and 64-bit installers are available, and each installer contains both a serial and parallel executable. The installer site also explains how to install the Windows MPI package (MPICH2 from Argonne National Labs), needed to run in parallel.

The LAMMPS binaries contain all optional packages included in the source distribution except: KIM, KOKKOS, USER-INTEL, and USER-QMMM. The serial version also does not include the MPIIO and USER-LB packages. GPU support is provided for OpenCL.

The installer site also has instructions on how to run LAMMPS under Windows, once it is installed, in both serial and parallel.

When you download the installer package, you run it on your Windows machine. It will then prompt you with a dialog, where you can choose the installation directory, unpack and copy several executables, potential files, documentation pdfs, selected example files, etc. It will then update a few system settings (e.g. PATH, LAMMPS_POTENTIALS) and add an entry into the Start Menu (with references to the documentation, LAMMPS homepage and more). From that menu, there is also a link to an uninstaller that removes the files and undoes the environment manipulations.

Note that to update to a newer version of LAMMPS, you should typically uninstall the version you currently have, download a new installer, and go through the install procedure described above. I.e. the same procedure for installing/updating most Windows programs. You can install multiple versions of LAMMPS (in different directories), but only the executable for the last-installed package will be found automatically, so this should only be done for debugging purposes.

Thanks to Axel Kohlmeyer (Temple U, akohlmey at gmail.com) for setting up this Windows capability.

## 2.4 Download an executable for Linux or Mac via Conda

Binaries are available for MacOS or Linux via Conda.

First, one must setup the Conda package manager on your system. Follow the instructions to install Miniconda, then create a conda environment (named my-lammps-env or whatever you prefer) for your lammps install:

```
% conda config --add channels conda-forge
% conda create -n my-lammps-env
```

Then, you can install lammps on your system with the following command:

```
% conda activate my-lammps-env
% conda install lammps
```
The LAMMPS binary is built with the *KIM package* which results in Conda also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from *openkim.org*, you can install the *openkim-models* package

```
% conda install openkim-models
```

If you have problems with the installation you can post issues to this link. Thanks to Jan Janssen (Max-Planck-Institut fuer Eisenforschung) for setting up the Conda capability.

### 2.5 Download source and documentation as a tarball

You can download a current LAMMPS tarball from the download page of the LAMMPS website.

You have two choices of tarballs, either the most recent stable release or the most current patch release. Stable releases occur a few times per year, and undergo more testing before release. Patch releases occur a couple times per month. The new contents in all releases are listed on the bug and feature page of the website.

Both tarballs include LAMMPS documentation (HTML and PDF files) corresponding to that version. The download page also has an option to download the current-version LAMMPS documentation by itself.

Older versions of LAMMPS can also be downloaded from this page.

Once you have a tarball, unzip and untar it with the following command:

```
$ tar -xzvf lammps*.tar.gz
```

This will create a LAMMPS directory with the version date in its name, e.g. lammps-23Jun18.

You can also download a zip file via the “Clone or download” button on the LAMMPS GitHub site. The file name will be lammps-master.zip which can be unzipped with the following command, to create a lammps-master dir:

```
$ unzip lammps*.zip
```

This version is the most up-to-date LAMMPS development version. It will have the date of the most recent patch release (see the file src/version.h). But it will also include any new bug-fixes or features added since the last patch release. They will be included in the next patch release tarball.

If you download a current LAMMPS tarball, one way to stay current as new patch tarballs are released, is to download a patch file which you can apply to your local directory to update it for each new patch release. (Or of course you could just download the newest tarball periodically.)

The patch files are posted on the bug and feature page of the website, along with a list of changed files and details about what is in the new patch release. Instructions for applying a patch file are on the Install patch doc page.

### 2.6 Download the LAMMPS source with git

All LAMMPS development is coordinated through the “LAMMPS GitHub site”. If you clone the LAMMPS repository onto your local machine, it has several advantages:

- You can stay current with changes to LAMMPS with a single git command.
- You can create your own development branches to add code to LAMMPS.
- You can submit your new features back to GitHub for inclusion in LAMMPS.
You must have git installed on your system to use the commands explained below to communicate with the git servers on GitHub. For people still using subversion (svn), GitHub also provides limited support for subversion clients.

**Note:** As of October 2016, the official home of public LAMMPS development is on GitHub. The previously advertised LAMMPS git repositories on git.lammps.org and bitbucket.org are now deprecated or offline.

You can follow LAMMPS development on 3 different git branches:

- **stable**: this branch is updated with every stable release
- **unstable**: this branch is updated with every patch release
- **master**: this branch continuously follows ongoing development

To access the git repositories on your box, use the clone command to create a local copy of the LAMMPS repository with a command like:

```bash
$ git clone -b unstable https://github.com/lammps/lammps.git mylammps
```

where “mylammps” is the name of the directory you wish to create on your machine and “unstable” is one of the 3 branches listed above. (Note that you actually download all 3 branches; you can switch between them at any time using "git checkout <branch name>".)

Once the command completes, your directory will contain the same files as if you unpacked a current LAMMPS tarball, with the exception, that the HTML documentation files are not included. They can be fetched from the LAMMPS website by typing `make fetch` in the doc directory. Or they can be generated from the content provided in doc/src by typing `make html` from the doc directory.

After initial cloning, as bug fixes and new features are added to LAMMPS you can stay up-to-date by typing the following git commands from within the “mylammps” directory:

```bash
$ git checkout unstable  # not needed if you always stay in this branch
$ git checkout stable   # use one of these 3 checkout commands
$ git checkout master   # to choose the branch to follow
$ git pull
```

Doing a “pull” will not change any files you have added to the LAMMPS directory structure. It will also not change any existing LAMMPS files you have edited, unless those files have changed in the repository. In that case, git will attempt to merge the new repository file with your version of the file and tell you if there are any conflicts. See the git documentation for details.

If you want to access a particular previous release version of LAMMPS, you can instead “check out” any version with a published tag. See the output of `git tag -l` for the list of tags. The git command to do this is as follows.

```bash
$ git checkout tagID
```

Stable versions and what tagID to use for a particular stable version are discussed on this page. Note that this command will print some warnings, because in order to get back to the latest revision and to be able to update with `git pull` again, you will need to do `git checkout unstable` (or check out any other desired branch) first.

Once you have updated your local files with a `git pull` (or `git checkout`), you still need to re-build LAMMPS if any source files have changed. To do this, you should cd to the src directory and type:

```bash
$ make purge  # remove any deprecated src files
$ make package-update  # sync package files with src files
$ make foo     # re-build for your machine (mpi, serial, etc)
```

just as described on the *Apply patch* doc page, after a patch has been installed.

2.6. Download the LAMMPS source with git
Warning: If you wish to edit/change a src file that is from a package, you should edit the version of the file inside the package sub-directory with src, then re-install the package. The version in the source directory is merely a copy and will be wiped out if you type “make package-update”.

Warning: The GitHub servers support both the “git://” and “https://” access protocols for anonymous read-only access. If you have a correspondingly configured GitHub account, you may also use SSH access with the URL “git@github.com:lammps/lammps.git”.

The LAMMPS GitHub project is managed by Christoph Junghans (LANL, junghans at lanl.gov), Axel Kohlmeyer (Temple U, akohlmey at gmail.com) and Richard Berger (Temple U, richard.berger at temple.edu).

2.7 Applying patches

It is easy to stay current with the most recent LAMMPS patch releases if you use git to track the LAMMPS development. Instructions for how to stay current are on the Download the LAMMPS source with git page.

If you prefer to download a tarball, as described on the tarball download page, you can stay current by downloading “patch files” when new patch releases are made. A link to a patch file is posted on the bug fixes and new feature page of the LAMMPS website, along with a list of changed files and details about what is in the new patch release. This page explains how to apply the patch file to your local LAMMPS directory.

Note: You should not apply patch files to a local git checkout of LAMMPS, only to an unpacked tarball. Use git commands to update such a version of the LAMMPS source code.

Here are the steps to apply a patch file. Note that if your version of LAMMPS is several patch releases behind, you need to apply all the intervening patch files in succession to bring your version of LAMMPS up to date.

- Download the patch file. You may have to shift-click in your browser to download the file instead of display it. Patch files have names like patch.12Dec16.
- Put the patch file in your top-level LAMMPS directory, where the LICENSE and README files are.
- Apply the patch by typing the following command from your top-level LAMMPS directory, where the redirected file is the name of the patch file.

    $ patch -bp1 < patch.12Dec16

- A list of updated files print out to the screen. The -b switch creates backup files of your originals (e.g. src/force.cpp.orig), so you can manually undo the patch if something goes wrong.
- Type the following from the src directory, to enforce consistency between the src and package directories. This is OK to do even if you don’t use one or more packages. If you are applying several patches successively, you only need to type this once at the end. The purge command removes deprecated src files if any were removed by the patch from package sub-directories.

    $ make purge
    $ make package-update

- Re-build LAMMPS via the “make” command.
**Warning:** If you wish to edit/change a source file that is part of a package, you should edit the version of the file inside the package folder in src, and then re-install or update the package. The version in the src directory is merely a copy and will be wiped out when you type “make package-update”.

These are the files and sub-directories in the LAMMPS distribution:

<table>
<thead>
<tr>
<th>Directory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>README</td>
<td>text file</td>
</tr>
<tr>
<td>LICENSE</td>
<td>GNU General Public License (GPL)</td>
</tr>
<tr>
<td>bench</td>
<td>benchmark problems</td>
</tr>
<tr>
<td>cmake</td>
<td>CMake build files</td>
</tr>
<tr>
<td>doc</td>
<td>documentation</td>
</tr>
<tr>
<td>examples</td>
<td>simple test problems</td>
</tr>
<tr>
<td>lib</td>
<td>additional provided or external libraries</td>
</tr>
<tr>
<td>potentials</td>
<td>interatomic potential files</td>
</tr>
<tr>
<td>python</td>
<td>Python wrapper on LAMMPS</td>
</tr>
<tr>
<td>src</td>
<td>source files</td>
</tr>
<tr>
<td>tools</td>
<td>pre- and post-processing tools</td>
</tr>
</tbody>
</table>

You will have all of these if you download source. You will only have some of them if you download executables, as explained on the pages listed above.
LAMMPS is built as a library and an executable from source code using either traditional makefiles for use with GNU make (which may require manual editing), or using a build environment generated by CMake (Unix Makefiles, Ninja, Xcode, Visual Studio, KDevelop, CodeBlocks and more).

As an alternative you can download a package with pre-built executables or automated build trees as described on the Install doc page.

### 3.1 Build LAMMPS with CMake

This page describes how to use CMake in general to build LAMMPS. Details for specific compile time settings and options to enable and configure add-on packages are discussed with those packages. Links to those pages on the Build overview page.

The following text assumes some familiarity with CMake and focuses on using the command line tool `cmake` and what settings are supported for building LAMMPS. A more detailed tutorial on how to use `cmake` itself, the text mode or graphical user interface, change the generated output files for different build tools and development environments is on a separate page.

**Note:** LAMMPS currently requires that CMake version 3.10 or later is available; version 3.12 or later is preferred.

**Warning:** You must not mix the traditional make based LAMMPS build procedure with using CMake. Thus no packages may be installed or a build been previously attempted in the LAMMPS source directory by using `make <machine>`. CMake will detect if this is the case and generate an error. To remove conflicting files from the src you can use the command `make no-all purge` which will un-install all packages and delete all auto-generated files.

### 3.1.1 Advantages of using CMake

CMake is an alternative to compiling LAMMPS in the traditional way through (manually customized) makefiles and a recent addition to LAMMPS thanks to the efforts of Christoph Junghans (LANL) and Richard Berger (Temple U). Using CMake has multiple advantages that are specifically helpful for people with limited experience in compiling software or for people that want to modify or extend LAMMPS.

- CMake can detect available hardware, tools, features, and libraries and adapt the LAMMPS default build configuration accordingly.
- CMake can generate files for different build tools and integrated development environments (IDE).
LAMMPS Documentation

- CMake supports customization of settings with a text mode or graphical user interface. No knowledge of file formats or complex command line syntax required.
- All enabled components are compiled in a single build operation.
- Automated dependency tracking for all files and configuration options.
- Support for true out-of-source compilation. Multiple configurations and settings with different choices of LAMMPS packages, settings, or compilers can be configured and built concurrently from the same source tree.
- Simplified packaging of LAMMPS for Linux distributions, environment modules, or automated build tools like Homebrew.
- Integration of automated regression testing (the LAMMPS side for that is still under development).

### 3.1.2 Getting started

Building LAMMPS with CMake is a two-step process. First you use CMake to generate a build environment in a new directory. For that purpose you can use either the command-line utility `cmake` (or `cmake3`), the text-mode UI utility `ccmake` (or `ccmake3`), or the graphical utility `cmake-gui`, or use them interchangeably. The second step is then the compilation and linking of all objects, libraries, and executables. Here is a minimal example using the command line version of CMake to build LAMMPS with no add-on packages enabled and no customization:

```bash
cd lammps
mkdir build; cd build
cmake ../cmake
cmake --build .
```

This will create and change into a folder called `build`, then run the configuration step to generate build files for the default build command and then launch that build command to compile LAMMPS. During the configuration step CMake will try to detect whether support for MPI, OpenMP, FFTW, gzip, JPEG, PNG, and ffmpeg are available and enable the corresponding configuration settings. The progress of this configuration can be followed on the screen and a summary of selected options and settings will be printed at the end. The `cmake --build .` command will launch the compilation, which, if successful, will ultimately produce a library `liblammps.a` and the LAMMPS executable `lmp` inside the `build` folder.

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with `make -j N` (with `N` being the maximum number of concurrently executed tasks). Also installation of the `ccache` (= Compiler Cache) software may speed up repeated compilation even more, e.g. during code development.

After the initial build, whenever you edit LAMMPS source files, enable or disable packages, change compiler flags or build options, you must re-compile and relink the LAMMPS executable with `cmake --build .` (or `make`). If the compilation fails for some reason, try running `cmake .` and then compile again. The included dependency tracking should make certain that only the necessary subset of files are re-compiled. You can also delete compiled objects, libraries and executables with `cmake --build . --target clean` (or `make clean`).

After compilation, you may optionally install the LAMMPS executable into your system with:

```bash
make install  # optional, copy compiled files into installation location
```

This will install the LAMMPS executable and library, some tools (if configured) and additional files like LAMMPS API headers, manpages, potential and force field files. The location of the installation tree defaults to `${HOME}/local.`
3.1.3 Configuration and build options

The CMake commands have one mandatory argument: a folder containing a file called CMakeLists.txt (for LAMMPS it is located in the cmake folder) or a build folder containing a file called CMakeCache.txt, which is generated at the end of the CMake configuration step. The cache file contains all current CMake settings.

To modify settings, enable or disable features, you need to set variables with either the -D command line flag (-D VARIABLE1_NAME=value) or change them in the text mode of graphical user interface. The -D flag can be used several times in one command.

For your convenience we provide CMake presets that combine multiple settings to enable optional LAMMPS packages or use a different compiler tool chain. Those are loaded with the -C flag (-C ../cmake/presets/minimal.cmake). This step would only be needed once, as the settings from the preset files are stored in the CMakeCache.txt file. It is also possible to customize the build by adding one or more -D flags to the CMake command line.

Generating files for alternate build tools (e.g. Ninja) and project files for IDEs like Eclipse, CodeBlocks, or Kate can be selected using the -G command line flag. A list of available generator settings for your specific CMake version is given when running cmake --help.

3.1.4 Installing CMake

Check if your machine already has CMake installed:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>which cmake</td>
<td># do you have it?</td>
</tr>
<tr>
<td>which cmake3</td>
<td># version 3 may have this name</td>
</tr>
<tr>
<td>cmake --version</td>
<td># what specific version you have</td>
</tr>
</tbody>
</table>

On clusters or supercomputers which use environment modules to manage software packages, do this:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module list</td>
<td># is a module for cmake already loaded?</td>
</tr>
<tr>
<td>module avail</td>
<td># is a module for cmake available?</td>
</tr>
<tr>
<td>module load cmake</td>
<td># load cmake module with appropriate name</td>
</tr>
</tbody>
</table>

Most Linux distributions offer pre-compiled cmake packages through their package management system. If you do not have CMake or a recent enough version (Note: for CentOS 7.x you need to enable the EPEL repository), you can download the latest version from https://cmake.org/download/. Instructions on how to install it on various platforms can be found on this page.

3.2 Build LAMMPS with make

Building LAMMPS with traditional makefiles requires that you have a Makefile.<machine> file appropriate for your system in either the src/MAKE, src/MAKE/MACHINES, src/MAKE/OPTIONS, or src/MAKE/MINE directory (see below). It can include various options for customizing your LAMMPS build with a number of global compilation options and features.
3.2.1 Requirements

Those makefiles are written for and tested with GNU make and may not be compatible with other make programs. In most cases, if the “make” program is not GNU make, then there will be a GNU make program available under the name “gmake”. If GNU make or a compatible make is not available, you may have to first install it or switch to building with CMake. The makefiles of the traditional make based build process and the scripts they are calling expect a few additional tools to be available and functioning.

- a working C/C++ compiler toolchain supporting the C++11 standard; on Linux these are often the GNU compilers. Some older compilers require adding flags like -std=c++11 to enable the C++11 mode.
- a Bourne shell compatible “Unix” shell program (often this is bash)
- a few shell utilities: ls, mv, ln, rm, grep, sed, tr, cat, touch, diff, dirname
- python (optional, required for make lib-<pkg> in the src folder). python scripts are currently tested with python 2.7 and 3.6. The procedure for building the documentation requires python 3.

3.2.2 Getting started

To include LAMMPS packages (i.e. optional commands and styles) you must enable (or “install”) them first, as discussed on the Build package doc page. If a packages requires (provided or external) libraries, you must configure and build those libraries before building LAMMPS itself and especially before enabling such a package with make yes--<package>. Building LAMMPS with CMake can automate much of this for many types of machines, especially workstations, desktops, and laptops, so we suggest you try it first when building LAMMPS in those cases.

The commands below perform a default LAMMPS build, producing the LAMMPS executable lmp_serial and lmp_mpi in lammps/src:

```
cd lammps/src  # change to main LAMMPS source folder
make serial    # build a serial LAMMPS executable using GNU g++
make mpi       # build a parallel LAMMPS executable with MPI
make           # see a variety of make options
```

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with make -j N (with N being the maximum number of concurrently executed tasks). Also installation of the ccache (= Compiler Cache) software may speed up repeated compilation even more, e.g. during code development.

After the initial build, whenever you edit LAMMPS source files, or add or remove new files to the source directory (e.g. by installing or uninstalling packages), you must re-compile and relink the LAMMPS executable with the same make <machine> command. The makefile’s dependency tracking should ensure that only the necessary subset of files are re-compiled. If you change settings in the makefile, you have to recompile everything. To delete all objects you can use make clean--<machine>.

**Note:** Before the actual compilation starts, LAMMPS will perform several steps to collect information from the configuration and setup that is then embedded into the executable. When you build LAMMPS for the first time, it will also compile a tool to quickly assemble a list of dependencies, that are required for the make program to correctly detect which parts need to be recompiled after changes were made to the sources.
3.2.3 Customized builds and alternate makefiles

The src/MAKE directory tree contains the Makefile.<machine> files included in the LAMMPS distribution. Typing `make example` uses Makefile.example from one of those folders, if available. Thus the make serial and make mpi lines above use src/MAKE/Makefile.serial and src/MAKE/Makefile.mpi, respectively. Other makefiles are in these directories:

<table>
<thead>
<tr>
<th>OPTIONS</th>
<th># Makefiles which enable specific options</th>
</tr>
</thead>
<tbody>
<tr>
<td>MACHINES</td>
<td># Makefiles for specific machines</td>
</tr>
<tr>
<td>MINE</td>
<td># customized Makefiles you create (you may need to create this folder)</td>
</tr>
</tbody>
</table>

Simply typing `make` lists all the available Makefile.<machine> files with a single line description toward the end of the output. A file with the same name can appear in multiple folders (not a good idea). The order the directories are searched is as follows: src/MAKE/MINE, src/MAKE, src/MAKE/OPTIONS, src/MAKE/MACHINES. This gives preference to a customized file you put in src/MAKE/MINE. If you create your own custom makefile under a new name, please edit the first line with the description and machine name, so you will not confuse yourself, when looking at the machine summary.

Makefiles you may wish to try include these (some require a package first be installed). Many of these include specific compiler flags for optimized performance. Please note, however, that some of these customized machine Makefile are contributed by users. Since both compilers, OS configurations, and LAMMPS itself keep changing, their settings may become outdated:

```
make mac                    # build serial LAMMPS on a Mac
make mac_mpi                # build parallel LAMMPS on a Mac
make intel_cpu             # build with the USER-INTEL package optimized for CPUs
make knl                   # build with the USER-INTEL package optimized for KNLs
make opt                   # build with the OPT package optimized for CPUs
make omp                   # build with the USER-OMP package optimized for OpenMP
make kokkos_omp            # build with the KOKKOS package for OpenMP
make kokkos_cuda_mpi       # build with the KOKKOS package for GPUs
make kokkos_phi            # build with the KOKKOS package for KNLs
```

3.3 Link LAMMPS as a library to another code

LAMMPS is designed as a library of C++ objects that can be integrated into other applications including Python scripts. The files src/library.cpp and src/library.h define a C-style API for using LAMMPS as a library. See the Library interface to LAMMPS page for a description of the interface and how to use it for your needs.

The Basic build options page explains how to build LAMMPS as either a shared or static library. This results in a file in the compilation folder called liblammps.a or liblammps_<name>.a in case of building a static library. In case of a shared library the name is the same only that the suffix is going to be either .so or .dylib or .dll instead of .a depending on the OS. In some cases the .so file may be a symbolic link to a file with the suffix .so.0 (or some other number).

Note: Care should be taken to use the same MPI library for the calling code and the LAMMPS library. The library.h file includes mpi.h and uses definitions from it so those need to be available and consistent. When LAMMPS is compiled with the included STUBS MPI library, then its mpi.h file needs to be included. While it is technically possible to use a full MPI library in the calling code and link to a serial LAMMPS library compiled with MPI STUBS, it is recommended to use the same MPI library for both, and then use MPI_Comm_split() in the calling code to pass a suitable communicator with a subset of MPI ranks to the function creating the LAMMPS instance.
3.3.1 Link with LAMMPS as a static library

The calling application can link to LAMMPS as a static library with compilation and link commands as in the examples shown below. These are examples for a code written in C in the file caller.c. The benefit of linking to a static library is, that the resulting executable is independent of that library since all required executable code from the library is copied into the calling executable.

**CMake build**

This assumes that LAMMPS has been configured without setting a LAMMPS_MACHINE name, installed with “make install”, and the PKG_CONFIG_PATH environment variable has been updated to include the liblammps.pc file installed into the configured destination folder. The commands to compile and link a coupled executable are then:

```bash
mpicc -c -O $(pkgconf liblammps --cflags) caller.c
mpicxx -o caller caller.o -$(pkgconf liblammps --libs)
```

**Traditional make**

This assumes that LAMMPS has been compiled in the folder `{HOME}/lammps/src` with “make mpi”. The commands to compile and link a coupled executable are then:

```bash
mpicc -c -O -I`{HOME}`/lammps/src caller.c
mpicxx -o caller caller.o -L`{HOME}`/lammps/src -llammps_mpi
```

The -I argument is the path to the location of the library.h header file containing the interface to the LAMMPS C-style library interface. The -L argument is the path to where the liblammps_mpi.a file is located. The -llammps_mpi argument is shorthand for telling the compiler to link the file liblammps_mpi.a. If LAMMPS has been built as a shared library, then the linker will use liblammps_mpi.so instead. If both files are available, the linker will usually prefer the shared library. In case of a shared library, you may need to update the LD_LIBRARY_PATH environment variable or running the caller executable will fail since it cannot find the shared library at runtime.

However, it is only as simple as shown above for the case of a plain LAMMPS library without any optional packages that depend on libraries (bundled or external) or when using a shared library. Otherwise, you need to include all flags, libraries, and paths for the coupled executable, that are also required to link the LAMMPS executable.

**CMake build**

When using CMake, additional libraries with sources in the lib folder are built, but not included in liblammps.a and (currently) not installed with make install and not included in the pkgconfig configuration file. They can be found in the top level build folder, but you have to determine the necessary link flags manually. It is therefore recommended to either use the traditional make procedure to build and link with a static library or build and link with a shared library instead.

**Traditional make**

After you have compiled a static LAMMPS library using the conventional build system for example with “make mode=static serial”. And you also have installed the POEMS package after building its bundled library in lib/poems. Then the commands to build and link the coupled executable change to:
Note, that you need to link with `g++` instead of `gcc` even if you have written your code in C, since LAMMPS itself is C++ code. You can display the currently applied settings for building LAMMPS for the “serial” machine target by using the command:

```bash
make mode=print serial
```

Which should output something like:

```bash
# Compiler:
CXX=g++
# Linker:
LD=g++
# Compilation:
CXXFLAGS=-g -O3 -DLAMMPS_GZIP -DLAMMPS_MEMALIGN=64 -I$HOME/compile/lammps/
→lib/poems -I$HOME/compile/lammps/src/STUBS
# Linking:
LDFLAGS=-g -O
# Libraries:
LDLIBS=-L$HOME/compile/lammps/src -llammps_serial -L$HOME/compile/lammps/
→lib/poems -L$HOME/compile/lammps/src/STUBS -lpoems -lmpi_stubs
```

From this you can gather the necessary paths and flags. With makefiles for other `machine` configurations you need to do the equivalent and replace “serial” with the corresponding “machine” name of the makefile.

### 3.3.2 Link with LAMMPS as a shared library

When linking to LAMMPS built as a shared library, the situation becomes much simpler, as all dependent libraries and objects are either included in the shared library or registered as a dependent library in the shared library file. Thus those libraries need not to be specified when linking the calling executable. Only the `-I` flags are needed. So the example case from above of the serial version static LAMMPS library with the POEMS package installed becomes:

**CMake build**

The commands with a shared LAMMPS library compiled with the CMake build process are the same as for the static library.

```bash
mpicc -c -O $(pkgconf liblammps --cflags) caller.c
mpicxx -o caller caller.o -$(pkgconf --libs)
```

**Traditional make**

The commands with a shared LAMMPS library compiled with the traditional make build using `make mode=shared serial` becomes:

```bash
gcc -c -O -I$HOME/lammps/src/STUBS -I$HOME/lammps/src -caller.c
g++ -o caller caller.o -L$HOME/lammps/src -llammps_serial
```
Locating liblammps.so at runtime

Unlike with a static link, now the liblammps.so file is required at runtime and needs to be in a folder, where the shared linker program of the operating system can find it. This would be either a folder like /usr/local/lib64 or ${HOME}/.local/lib64 or a folder pointed to by the LD_LIBRARY_PATH environment variable. You can type

```
printenv LD_LIBRARY_PATH
```
to see what directories are in that list.

Or you can add the LAMMPS src directory or the directory you performed a CMake style build in to your LD_LIBRARY_PATH environment variable, so that the current version of the shared library is always available to programs that use it.

For the Bourne or Korn shells (/bin/sh, /bin/ksh, /bin/bash etc.), you would add something like this to your ${HOME}/.profile file:

```
LD_LIBRARY_PATH ${LD_LIBRARY_PATH}-/usr/lib64:
export LD_LIBRARY_PATH
```

For the csh or tcsh shells, you would equivalently add something like this to your ${HOME}/.cshrc file:

```
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:
```

You can verify whether all required shared libraries are found with the ldd tool. Example:

```
$ LD_LIBRARY_PATH=/home/user/lammps/src ldd caller
  linux-vdso.so.1 (0x00007ffe729e0000)
  liblammps.so => /home/user/lammps/src/liblammps.so (0x00007fc91bb9e000)
  libstdc++.so.6 => /lib64/libstdc++.so.6 (0x00007fc91b984000)
  libm.so.6 => /lib64/libm.so.6 (0x00007fc91b83e000)
  libgcc_s.so.1 => /lib64/libgcc_s.so.1 (0x00007fc91b824000)
  libc.so.6 => /lib64/libc.so.6 (0x00007fc91b65b000)
  /lib64/ld-linux-x86-64.so.2 (0x00007fc91c094000)
```

If a required library is missing, you would get a ‘not found’ entry:

```
$ ldd caller
  linux-vdso.so.1 (0x00007ffdf672fe000)
  liblammps.so => not found
  libstdc++.so.6 => /usr/lib64/libstdc++.so.6 (0x00007fb7c7e86000)
  libm.so.6 => /usr/lib64/libm.so.6 (0x00007fb7c7d40000)
  libgcc_s.so.1 => /usr/lib64/libgcc_s.so.1 (0x00007fb7c7d26000)
  libc.so.6 => /usr/lib64/libc.so.6 (0x00007fb7c7b5d000)
  /lib64/ld-linux-x86-64.so.2 (0x00007fb7c80a2000)
```
3.4 Basic build options

The following topics are covered on this page, for building both with CMake and make:

- **Serial vs parallel build**
- **Choice of compiler and compile/link options**
- **Build the LAMMPS executable and library**
- **Including and removing debug support**
- **Build the LAMMPS documentation**
- **Install LAMMPS after a build**

3.4.1 Serial vs parallel build

LAMMPS is written to use the ubiquitous MPI (Message Passing Interface) library API for distributed memory parallel computation. You need to have such a library installed for building and running LAMMPS in parallel using a domain decomposition parallelization. It is compatible with the MPI standard version 2.x and later. LAMMPS can also be built into a “serial” executable for use with a single processor using the bundled MPI STUBS library.

Independent of the distributed memory MPI parallelization, parts of LAMMPS are also written with support for shared memory parallelization using the OpenMP threading standard. A more detailed discussion of that is below.

**CMake build**

```
-D BUILD_MPI=value # yes or no, default is yes if CMake finds MPI,
                   # else no
-D BUILD_OMP=value # yes or no, default is yes if a compatible
                    # compiler is detected
-D LAMMPS_MACHINE=name # name = mpi, serial, mybox, titan, laptop, etc
                        # no default value
```

The executable created by CMake (after running make) is named lmp unless the LAMMPS_MACHINE option is set. When setting LAMMPS_MACHINE=name the executable will be called lmp_name. Using BUILD_MPI=no will enforce building a serial executable using the MPI STUBS library.

**Traditional make**

The build with traditional makefiles has to be done inside the source folder src.

```
make mpi # parallel build, produces lmp_mpi using Makefile.mpi
make serial # serial build, produces lmp_serial using Makefile/
              #serial
make mybox  # uses Makefile.mybox to produce lmp_mybox
```

Any make machine command will look up the make settings from a file Makefile.machine in the folder src/MAKE or one of its sub-directories MINE, MACHINES, or OPTIONS, create a folder Obj_machine with all objects and generated files and an executable called lmp_machine. The standard parallel build with make mpi assumes a standard MPI installation with MPI compiler wrappers where all necessary compiler and linker flags to get access and link with the suitable MPI headers and libraries are set by the wrapper programs. For other cases or the serial build, you have to adjust the make
file variables `MPI_INC`, `MPI_PATH`, `MPI_LIB` as well as `CC` and `LINK`. To enable OpenMP threading usually a compiler specific flag needs to be added to the compile and link commands. For the GNU compilers, this is `-fopenmp`, which can be added to the `CC` and `LINK` makefile variables.

For the serial build the following make variables are set (see `src/MAKE/Makefile.serial`):

```
CC = g++
LINK = g++
MPI_INC = -I../STUBS
MPI_PATH = -L../STUBS
MPI_LIB = -lmpi_stubs
```

You also need to build the STUBS library for your platform before making LAMMPS itself. A `make serial` build does this for you automatically, otherwise, type `make mpi-stubs` from the `src` directory, or `make from the src/STUBS dir`. If the build fails, you may need to edit the `STUBS/Makefile` for your platform. The stubs library does not provide MPI/IO functions required by some LAMMPS packages, e.g. `MPIIO` or `USER-LB`, and thus is not compatible with those packages.

**Note:** The file `src/STUBS/mpi.c` provides a CPU timer function called `MPI_Wtime()` that calls `gettimeofday()`. If your operating system does not support `gettimeofday()`, you will need to insert code to call another timer. Note that the ANSI-standard function `clock()` rolls over after an hour or so, and is therefore insufficient for timing long LAMMPS simulations.

---

**MPI and OpenMP support in LAMMPS**

If you are installing MPI yourself to build a parallel LAMMPS executable, we recommend either MPICH or OpenMPI which are regularly used and tested with LAMMPS by the LAMMPS developers. MPICH can be downloaded from the [MPICH home page](http://www.mpich.org/) and OpenMPI can be downloaded correspondingly from the [OpenMPI home page](http://www.open-mpi.org/). Other MPI packages should also work. No specific vendor provided and standard compliant MPI library is currently known to be incompatible with LAMMPS. If you are running on a large parallel machine, your system admins or the vendor should have already installed a version of MPI, which is likely to be faster than a self-installed MPICH or OpenMPI, so you should study the provided documentation to find out how to build and link with it.

The majority of OpenMP (threading) support in LAMMPS is provided by the `USER-OMP` package; see the [USER-OMP package page](http://www.lammps.org/) for details. The `USER-INTEL` package also includes OpenMP threading (it is compatible with `USER-OMP` and will usually fall back on styles from that package, if a `USER-INTEL` does not exist) and adds vectorization support when compiled with compatible compilers, in particular the Intel compilers on top of OpenMP. Also, the `KOKKOS` package can be compiled to include OpenMP threading.

In addition, there are a few commands in LAMMPS that have native OpenMP support included as well. These are commands in the `MPIIO`, `SNAP`, `USER-DIFFRACTION`, and `USER-DPD` packages. In addition some packages support OpenMP threading indirectly through the libraries they interface to: e.g. `LATTE`, `KSPACE`, and `USER-COLVARS`. See the [Packages details](http://www.lammps.org/) doc page for more info on these packages and the doc pages for their respective commands for OpenMP threading info.

For CMake, if you use `BUILD_OMP=yes`, you can use these packages and turn on their native OpenMP support and turn on their native OpenMP support at run time, by setting the `OMP_NUM_THREADS` environment variable before you launch LAMMPS.

For building via conventional make, the `CCFLAGS` and `LINKFLAGS` variables in `Makefile.machine` need to include the compiler flag that enables OpenMP. For GNU compilers it is `-fopenmp`. For (recent) Intel compilers it is `-qopenmp`. If you are using a different compiler, please refer to its documentation.
OpenMP Compiler compatibility

Some compilers do not fully support the default(none) directive and others (e.g. GCC version 9 and beyond, Clang version 10 and later) may implement strict OpenMP 4.0 and later semantics, which are incompatible with the OpenMP 3.1 semantics used in LAMMPS for maximal compatibility with compiler versions in use. If compilation with OpenMP enabled fails because of your compiler requiring strict OpenMP 4.0 semantic, you can change the behavior by adding --LAMMPS_OMP_COMPAT=4 to the LMP_INC variable in your makefile, or add it to the command line while configuring with CMake. CMake will detect the suitable setting for the GNU, Clang, and Intel compilers.

3.4.2 Choice of compiler and compile/link options

The choice of compiler and compiler flags can be important for maximum performance. Vendor provided compilers for a specific hardware can produce faster code than open-source compilers like the GNU compilers. On the most common x86 hardware most popular C++ compilers are quite similar in performance of C/C++ code at high optimization levels. When using the USER-INTEL package, there is a distinct advantage in using the Intel C++ compiler due to much improved vectorization through SSE and AVX instructions on compatible hardware as the source code includes changes and Intel compiler specific directives to enable high degrees of vectorization. This may change over time as equivalent vectorization directives are included into OpenMP standard revisions and other compilers adopt them.

On parallel clusters or supercomputers which use “environment modules” for their compile/link environments, you can often access different compilers by simply loading the appropriate module before building LAMMPS.

CMake build

By default CMake will use the compiler it finds according to internal preferences and it will add optimization flags appropriate to that compiler and any accelerator packages you have included in the build. CMake will check if the detected or selected compiler is compatible with the C++ support requirements of LAMMPS and stop with an error, if this is not the case.

You can tell CMake to look for a specific compiler with setting CMake variables (listed below) during configuration. For a few common choices, there are also presets in the cmake/presets folder. For convenience, there is a CMAKE_TUNE_FLAGS variable that can be set to apply global compiler options (applied to compilation only), to be used for adding compiler or host specific optimization flags in addition to the “flags” variables listed below. You may also specify the corresponding CMAKE_*_FLAGS variables individually, if you want to experiment with alternate optimization flags. You should specify all 3 compilers, so that the (few) LAMMPS source files written in C or Fortran are built with a compiler consistent with the one used for the C++ files:

-D CMAKE_CXX_COMPILER=name  # name of C++ compiler
-D CMAKE_C_COMPILER=name    # name of C compiler
-D CMAKE_Fortran_COMPILER=name  # name of Fortran compiler
-D CMAKE_CXX_FLAGS=string   # flags to use with C++ compiler
-D CMAKE_C_FLAGS=string     # flags to use with C compiler
-D CMAKE_Fortran_FLAGS=string  # flags to use with Fortran compiler

A few example command lines are:

# Building with GNU Compilers:
 cmake ../cmake -DCMAKE_C_COMPILER=gcc -DCMAKE_CXX_COMPILER=g++ -DCMAKE_Fortran_COMPILER=gfortran

# Building with Intel Compilers:
 cmake ../cmake -DCMAKE_C_COMPILER=icc -DCMAKE_CXX_COMPILER=icpc -DCMAKE_Fortran_COMPILER=ifort

(continues on next page)
# Building with LLVM/Clang Compilers:
```
cmake .. / cmake - D CMake_C_COMPILER= clang - D CMake_CXX_COMPILER= clang++ - D CMake_Fortran_COMPILER= f lang
```

For compiling with the Clang/LLVM compilers a CMake preset is provided that can be loaded with `-C ../cmake/presets/clang.cmake`. Similarly, `-C ../cmake/presets/intel.cmake` should switch the compiler toolchain to the Intel compilers.

In addition you can set `CMAKE_TUNE_FLAGS` to specifically add compiler flags to tune for optimal performance on given hosts. By default this variable is empty.

**Note:** When the cmake command completes, it prints a summary to the screen which compilers it is using and what flags and settings will be used for the compilation. Note that if the top-level compiler is `mpicxx`, it is simply a wrapper on a real compiler. The underlying compiler info is what CMake will try to determine and report. You should check to confirm you are using the compiler and optimization flags you want.

---

### Makefile.machine settings for traditional make

The “compiler/linker settings” section of a Makefile.machine lists compiler and linker settings for your C++ compiler, including optimization flags. For a parallel build it is recommended to use `mpicxx` or `mpiCC`, since these compiler wrappers will include a variety of settings appropriate for your MPI installation and thus avoiding the guesswork of finding the right flags.

**Parallel build (see `src/MAKE/Makefile.mpi`):**

```bash
CC = mpicxx
CCFLAGS = -g -O3
LINK = mpicxx
LINKFLAGS = -g -O
```

**Serial build with GNU gcc (see `src/MAKE/Makefile.serial`):**

```bash
CC = g++
CCFLAGS = -g -O3
LINK = g++
LINKFLAGS = -g -O
```

**Note:** If compilation stops with a message like the following:
```
g++ -g -O3 -DLAMMPS_GZIP -DLAMMPS_MEMALIGN=64 -I .. /STUBS - c .. /main.
```

then you have either an unsupported (old) compiler or you have to turn on C++11 mode. The latter applies to GCC 4.8.x shipped with RHEL 7.x and CentOS 7.x. For those compilers, you need to add the `-std=c++11` flag. Otherwise, you would have to install a newer compiler that supports C++11; either as a binary package or through compiling from source.
If you build LAMMPS with any Accelerator packages included, there may be specific compiler or linker flags that are either required or recommended to enable required features and to achieve optimal performance. You need to include these in the CCFLAGS and LINKFLAGS settings above. For details, see the individual package doc pages listed on the Accelerator packages page. Or examine these files in the src/MAKE/OPTIONS directory. They correspond to each of the 5 accelerator packages and their hardware variants:

<table>

</tbody>
</table>

3.4.3 Build the LAMMPS executable and library

LAMMPS is always built as a library of C++ classes plus an executable. The executable is a simple main() function that sets up MPI and then creates a LAMMPS class instance from the LAMMPS library, which will then process commands provided via a file or from the console input. The LAMMPS library can also be called from another application or a scripting language. See the Howto couple doc page for more info on coupling LAMMPS to other codes. See the Python doc page for more info on wrapping and running LAMMPS from Python via its library interface.

CMake build

For CMake builds, you can select through setting CMake variables between building a shared or a static LAMMPS library and what kind of suffix is added to them (in case you want to concurrently install multiple variants of binaries with different settings). If none are set, defaults are applied.

- `BUILD_SHARED_LIBS=value` # yes or no (default)
- `LAMMPS_MACHINE=name` # name = mpi, serial, mybox, titan, laptop, etc
  # no default value

The compilation will always produce a LAMMPS library and an executable linked to it. By default this will be a static library named liblammps.a and an executable named lmp. Setting `BUILD_SHARED_LIBS=yes` will instead produce a shared library called liblammps.so (or liblammps.dylib or liblammps.dll depending on the platform). If `LAMMPS_MACHINE=name` is set in addition, the name of the generated libraries will be changed to either liblammps_name.a or liblammps_name.so, respectively and the executable will be called lmp_name.

Traditional make

With the traditional makefile based build process, the choice of the generated executable or library depends on the “mode” setting. Several options are available and `mode=static` is the default.

```
make machine          # build LAMMPS executable lmp_machine
make mode=static machine # same as "make machine"
make mode=shared machine # build LAMMPS shared lib liblammps_machine.so
```

3.4. Basic build options
The “static” build will generate a static library called liblammps_machine.a and an executable named lmp_machine, while the “shared” build will generate a shared library liblammps_machine.so instead and lmp_machine will be linked to it. The build step will also create generic soft links, named liblammps.a and liblammps.so, which point to the specific liblammps_machine.a/so files.

Additional information

Note that for creating a shared library, all the libraries it depends on must be compiled to be compatible with shared libraries. This should be the case for libraries included with LAMMPS, such as the dummy MPI library in src/STUBS or any package libraries in the lib directory, since they are always built in a shared library compatible way using the -fPIC compiler switch. However, if an auxiliary library (like MPI or FFTW) does not exist as a compatible format, the shared library linking step may generate an error. This means you will need to install a compatible version of the auxiliary library. The build instructions for that library should tell you how to do this.

As an example, here is how to build and install the MPICH library, a popular open-source version of MPI, as a shared library in the default /usr/local/lib location:

```
./configure --enable-shared
make
make install
```

You may need to use `sudo make install` in place of the last line if you do not have write privileges for /usr/local/lib or use the --prefix configuration option to select an installation folder, where you do have write access. The end result should be the file /usr/local/lib/libmpich.so. On many Linux installations the folder ${HOME}/.local is an alternative to using /usr/local and does not require superuser or sudo access. In that case the configuration step becomes:

```
./configure --enable-shared --prefix=${HOME}/.local
```

Avoiding to use “sudo” for custom software installation (i.e. from source and not through a package manager tool provided by the OS) is generally recommended to ensure the integrity of the system software installation.

3.4.4 Including or removing debug support

By default the compilation settings will include the -g flag which instructs the compiler to include debug information (e.g. which line of source code a particular instruction correspond to). This can be extremely useful in case LAMMPS crashes and can help to provide crucial information in tracking down the origin of a crash and help the LAMMPS developers fix bugs in the source code. However, this increases the storage requirements for object files, libraries, and the executable 3-5 fold.

If this is a concern, you can change the compilation settings or remove the debug information from the LAMMPS executable:

- **Traditional make**: edit your Makefile.<machine> to remove the -g flag from the CCFLAGS and LINKFLAGS definitions
- **CMake**: use `-D CMAKE_BUILD_TYPE=Release` or explicitly reset the applicable compiler flags (best done using the text mode or graphical user interface).
- **Remove debug info**: If you are only concerned about the executable being too large, you can use the `strip` tool (e.g. `strip lmp_serial`) to remove the debug information from the executable file. Do not strip libraries or object files, as that will render them unusable.
3.4.5 Build the LAMMPS documentation

The LAMMPS manual is written in reStructuredText format which can be translated to different output format using the Sphinx document generator tool. Currently the translation to HTML and PDF (via LaTeX) are supported. For that to work a Python 3 interpreter and internet access is required. For the documentation build a python based virtual environment is set up in the folder doc/docenv and various python packages are installed into that virtual environment via the pip tool. The actual translation is then done via make commands.

Documentation makefile options

The following make commands can be issued in the doc folder of the LAMMPS source distribution.

```
make html   # create HTML doc pages in html directory
make pdf    # create Manual.pdf in this directory
make fetch  # fetch HTML and PDF files from LAMMPS web site
make clean  # remove all intermediate files
make clean-all # reset the entire doc build environment
make anchor_check # scan for duplicate anchor labels
make style_check # check for complete and consistent style lists
make package_check # check for complete and consistent package lists
make spelling  # spell-check the manual
```

Thus “make html” will create a “doc/html” directory with the HTML format manual pages so that you can browse them with a web browser locally on your system.

**Note:** You can also download a tarball of the documentation for the current LAMMPS version (HTML and PDF files), from the website download page.

CMake build options

It is also possible to create the HTML version (and only the HTML version) of the manual within the CMake build directory. The reason for this option is to include the installation of the HTML manual pages into the “install” step when installing LAMMPS after the CMake build via `make install`. The documentation build is included in the default build target, but can also be requested independently with `make doc`.

```
-D BUILD_DOC=value         # yes or no (default)
```

3.4.6 Build LAMMPS tools

Some tools described in Auxiliary tools can be built directly using CMake or Make.

```
-CMake build
-D BUILD_TOOLS=value       # yes or no (default)
```

3.4. Basic build options
The generated binaries will also become part of the LAMMPS installation (see below).

### 3.4.7 Install LAMMPS after a build

After building LAMMPS, you may wish to copy the LAMMPS executable of library, along with other LAMMPS files (library header, doc files) to a globally visible place on your system, for others to access. Note that you may need super-user privileges (e.g. sudo) if the directory you want to copy files to is protected.

#### CMake build

```
cmake -D CMAKE_INSTALL_PREFIX=path [options ...] ../cmake
make
# perform make after CMake command
make install
# perform the installation into prefix
```

#### Traditional make

There is no “install” option in the `src/Makefile` for LAMMPS. If you wish to do this you will need to first build LAMMPS, then manually copy the desired LAMMPS files to the appropriate system directories.

### 3.5 Optional build settings

LAMMPS can be built with several optional settings. Each sub-section explain how to do this for building both with CMake and make.

- **C++11 standard compliance** when building all of LAMMPS
- **FFT library** for use with the `kspace_style pppm` command
- **Size of LAMMPS integer types**
- **Read or write compressed files**
- **Output of JPG and PNG files** via the `dump image` command
- **Output of movie files** via the `dump_movie` command
- **Memory allocation alignment**
- **Workaround for long long integers**
- **Error handling exceptions** when using LAMMPS as a library
3.5.1 C++11 standard compliance

A C++11 standard compatible compiler is a requirement for compiling LAMMPS. LAMMPS version 3 March 2020 is the last version compatible with the previous C++98 standard for the core code and most packages. Most currently used C++ compilers are compatible with C++11, but some older ones may need extra flags to enable C++11 compliance. Example for GNU c++ 4.8.x:

```
CCFLAGS = -g -O3 -std=c++11
```

3.5.2 FFT library

When the KSPACE package is included in a LAMMPS build, the `kspace_style pppm` command performs 3d FFTs which require use of an FFT library to compute 1d FFTs. The KISS FFT library is included with LAMMPS but other libraries can be faster. LAMMPS can use them if they are available on your system.

**CMake build**

- `-D FFT=value` # FFTW3 or MKL or KISS, default is FFTW3 if found, else KISS
- `-D FFT_SINGLE=value` # yes or no (default), no = double precision
- `-D FFT_PACK=value` # array (default) or pointer or memcpy

**Note:** The values for the FFT variable must be in upper-case. This is an exception to the rule that all CMake variables can be specified with lower-case values.

Usually these settings are all that is needed. If FFTW3 is selected, then CMake will try to detect, if threaded FFTW libraries are available and enable them by default. This setting is independent of whether OpenMP threads are enabled and a packages like KOKKOS or USER-OMP is used. If CMake cannot detect the FFT library, you can set these variables to assist:

- `-D FFTW3_INCLUDE_DIR=path` # path to FFTW3 include files
- `-D FFTW3_LIBRARY=path` # path to FFTW3 libraries
- `-D FFT_FFTW_THREADS=on` # enable using threaded FFTW3 libraries
- `-D MKL_INCLUDE_DIR=path` # ditto for Intel MKL library
- `-D MKL_THREADS=on` # enable using threaded FFTs with MKL libraries
- `-D MKL_LIBRARY=path` # path to MKL libraries

**Traditional make**

To change the FFT library to be used and its options, you have to edit your machine Makefile. Below are examples how the makefile variables could be changed.

```
FFT_INC = -DFFT_FFTW3 # -DFFT_FFTW3, -DFFT_FFTW (same as -DFFT_FFTW3), -DFFT_MKL, or -DFFT_KISS
```

(continues on next page)
FFT_INC = -DFFT_SINGLE # do not specify for double precision
FFT_INC = -DFFT_FFTW_THREADS # enable using threaded FFTW3 libraries
FFT_INC = -DFFT_MKL_THREADS # enable using threaded FFTs with MKL libraries
FFT_INC = -DFFT_PACK_ARRAY # or -DFFT_PACK_POINTER or -DFFT_PACK_MEMCPY
        # default is FFT_PACK_ARRAY if not specified

FFT_INC = -I/usr/local/include
FFT_PATH = -L/usr/local/lib
FFT_LIB = -lfftw3 # FFTW3 double precision
        # needs -DFFT_FFTW_THREADS
FFT_LIB = -lfftw3 -lfftw3_omp # FFTW3 double precision with threads
FFT_LIB = -lmkl_intel_lp64 -lmkl_sequential -lmkl_core # MKL with
        # Intel compiler, serial interface
FFT_LIB = -lmkl_gf_lp64 -lmkl_sequential -lmkl_core # MKL with
        # GNU compiler, serial interface
FFT_LIB = -lmkl_intel_lp64 -lmkl_intel_thread -lmkl_core # MKL with
        # Intel compiler, threaded interface
FFT_LIB = -lmkl_gf_lp64 -lmkl_gnu_thread -lmkl_core # MKL with
        # GNU compiler, threaded interface
FFT_LIB = -lmkl_rt # MKL with automatic runtime selection
        # of interface libs

As with CMake, you do not need to set paths in FFT_INC or FFT_PATH, if the compiler can find the FFT header and library files in its default search path. You must specify FFT_LIB with the appropriate FFT libraries to include in the link.

The KISS FFT library is included in the LAMMPS distribution. It is portable across all platforms. Depending on the size of the FFTs and the number of processors used, the other libraries listed here can be faster.

However, note that long-range Coulombics are only a portion of the per-timestep CPU cost, FFTs are only a portion of long-range Coulombics, and 1d FFTs are only a portion of the FFT cost (parallel communication can be costly). A breakdown of these timings is printed to the screen at the end of a run when using the kspace_style pppm command. The Screen and logfile output doc page gives more details. A more detailed (and time consuming) report of the FFT performance is generated with the kspace_modify fftbench yes command.

FFTW is a fast, portable FFT library that should also work on any platform and can be faster than the KISS FFT library. You can download it from www.fftw.org. LAMMPS requires version 3.X; the legacy version 2.1.X is no longer supported.

Building FFTW for your box should be as simple as ./configure; make; make install. The install command typically requires root privileges (e.g. invoke it via sudo), unless you specify a local directory with the “--prefix” option of configure. Type ./configure --help to see various options.

The Intel MKL math library is part of the Intel compiler suite. It can be used with the Intel or GNU compiler (see the FFT_LIB setting above).

Performing 3d FFTs in parallel can be time consuming due to data access and required communication. This cost can be reduced by performing single-precision FFTs instead of double precision. Single precision means the real and imaginary parts of a complex datum are 4-byte floats. Double precision means they are 8-byte doubles. Note that Fourier transform and related PPPM operations are somewhat less sensitive to floating point truncation errors and thus the resulting error is less than the difference in precision. Using the -DFFT_SINGLE setting trades off a little accuracy for reduced memory use and parallel communication costs for transposing 3d FFT data.

When using -DFFT_SINGLE with FFTW3 you may need to build the FFTW library a second time with support for single-precision.
For FFTW3, do the following, which should produce the additional library `libfftw3f.a` or `libfftw3f.so`.

```bash
make clean
./configure --enable-single; make; make install
```

Performing 3d FFTs requires communication to transpose the 3d FFT grid. The data packing/unpacking for this can be done in one of 3 modes (ARRAY, POINTER, MEMCPY) as set by the FFT_PACK syntax above. Depending on the machine, the size of the FFT grid, the number of processors used, one option may be slightly faster. The default is ARRAY mode.

### 3.5.3 Size of LAMMPS integer types and size limits

LAMMPS has a few integer data types which can be defined as either 4-byte (= 32-bit) or 8-byte (= 64-bit) integers at compile time. This has an impact on the size of a system that can be simulated or how large counters can become before “rolling over”. The default setting of “smallbig” is almost always adequate.

#### CMake build

With CMake the choice of integer types is made via setting a variable during configuration.

```bash
-D LAMMPS_SIZES=value  # smallbig (default) or bigbig or smallsmall
```

If the variable is not set explicitly, “smallbig” is used.

#### Traditional build

If you want a setting different from the default, you need to edit the `LMP_INC` variable setting your machine Makefile.

```bash
LMP_INC = -DLAMMPS_SMALLBIG  # or -DLAMMPS_BIGBIG or -DLAMMPS_SMALLSMALL
```

The default setting is `-DLAMMPS_SMALLBIG` if nothing is specified.

### LAMMPS system size restrictions

<table>
<thead>
<tr>
<th></th>
<th>smallbig</th>
<th>bigbig</th>
<th>smallsmall</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total atom count</td>
<td>(2^{64}) atoms (= 9.223 \cdot 10^{18})</td>
<td>(2^{64}) atoms (= 9.223 \cdot 10^{18})</td>
<td>(2^{41}) atoms (= 2.147 \cdot 10^{9})</td>
</tr>
<tr>
<td>Total timesteps</td>
<td>(2^{63}) steps (= 9.223 \cdot 10^{18})</td>
<td>(2^{63}) steps (= 9.223 \cdot 10^{18})</td>
<td>(2^{31}) steps (= 2.147 \cdot 10^{9})</td>
</tr>
<tr>
<td>Atom ID values</td>
<td>(1 \leq i \leq 2^{31}) (= 2.147 \cdot 10^{9})</td>
<td>(1 \leq i \leq 2^{31}) (= 2.147 \cdot 10^{9})</td>
<td>(1 \leq i \leq 2^{31}) (= 2.147 \cdot 10^{9})</td>
</tr>
<tr>
<td>Image flag values</td>
<td>(-512 \leq i \leq 511)</td>
<td>(-1048576 \leq i \leq 1048575)</td>
<td>(-512 \leq i \leq 511)</td>
</tr>
</tbody>
</table>

The “bigbig” setting increases the size of image flags and atom IDs over “smallbig” and the “smallsmall” setting is only needed if your machine does not support 64-bit integers or incurs performance penalties when using them.

These are limits for the core of the LAMMPS code, specific features or some styles may impose additional limits. The `USER-ATC` package cannot be compiled with the “bigbig” setting. Also, there are limitations when using the library interface where some functions with known issues have been replaced by dummy calls printing a corresponding error message rather than crashing randomly or corrupting data.

### 3.5. Optional build settings
Atom IDs are not required for atomic systems which do not store bond topology information, though IDs are enabled by default. The `atom_modify id no` command will turn them off. Atom IDs are required for molecular systems with bond topology (bonds, angles, dihedrals, etc). Similarly, some force or compute or fix styles require atom IDs. Thus if you model a molecular system or use one of those styles with more than 2 billion atoms, you need the “bigbig” setting.

Regardless of the total system size limits, the maximum number of atoms per MPI rank (local + ghost atoms) is limited to 2 billion for atomic systems and 500 million for systems with bonds (the additional restriction is due to using the 2 upper bits of the local atom index in neighbor lists for storing special bonds info).

Image flags store 3 values per atom in a single integer which count the number of times an atom has moved through the periodic box in each dimension. See the `dump` doc page for a discussion. If an atom moves through the periodic box more than this limit, the value will “roll over”, e.g. from 511 to -512, which can cause diagnostics like the mean-squared displacement, as calculated by the `compute msd` command, to be faulty.

Also note that the GPU package requires its lib/gpu library to be compiled with the same size setting, or the link will fail. A CMake build does this automatically. When building with make, the setting in whichever lib/gpu/Makefile is used must be the same as above.

### 3.5.4 Output of JPG, PNG, and movie files

The `dump image` command has options to output JPEG or PNG image files. Likewise the `dump movie` command outputs movie files in MPEG format. Using these options requires the following settings:

#### CMake build

```bash
-D WITH_JPEG=value # yes or no
-D WITH_PNG=value  # yes or no
-D WITH_FFMPEG=value # yes or no
```

Usually these settings are all that is needed. If CMake cannot find the graphics header, library, executable files, you can set these variables:

```bash
-D JPEG_INCLUDE_DIR=path  # path to jpeglib.h header file
-D JPEG_LIBRARY=path      # path to libjpeg.a (.so) file
-D PNG_INCLUDE_DIR=path    # path to png.h header file
-D PNG_LIBRARY=path        # path to libpng.a (.so) file
-D ZLIB_INCLUDE_DIR=path   # path to zlib.h header file
-D ZLIB_LIBRARY=path       # path to libz.a (.so) file
-D FFMPEG_EXECUTABLE=path  # path to ffmpeg executable
```

#### Traditional make

```bash
LMP_INC = -DLAMMPS_JPEG
LMP_INC = -DLAMMPS_PNG
LMP_INC = -DLAMMPS_FFMPEG

JPG_INC = -I/usr/local/include  # path to jpeglib.h, png.h, zlib.h header files if make cannot find them
```

(continues on next page)
As with CMake, you do not need to set JPG_INC or JPG_PATH, if make can find the graphics header and library files. You must specify JPG_LIB with a list of graphics libraries to include in the link. You must insure ffmpeg is in a directory where LAMMPS can find it at runtime, that is a directory in your PATH environment variable.

Using ffmpeg to output movie files requires that your machine supports the “popen” function in the standard runtime library.

**Note:** On some clusters with high-speed networks, using the fork() library call (required by popen()) can interfere with the fast communication library and lead to simulations using ffmpeg to hang or crash.

### 3.5.5 Read or write compressed files

If this option is enabled, large files can be read or written with gzip compression by several LAMMPS commands, including `read_data`, `rerun`, and `dump`.

**CMake build**

```
-D WITH_GZIP=value  # yes or no
-D GZIP_EXECUTABLE=path  # path to gzip executable if CMake cannot find it
```

**Traditional make**

```
LMP_INC = -DLAMMPS_GZIP
```

This option requires that your operating system fully supports the “popen()” function in the standard runtime library and that a gzip executable can be found by LAMMPS during a run.

**Note:** On some clusters with high-speed networks, using the “fork()” library call (required by “popen()”) can interfere with the fast communication library and lead to simulations using compressed output or input to hang or crash. For selected operations, compressed file I/O is also available using a compression library instead, which is what the COMPRESS package enables.
3.5.6 Memory allocation alignment

This setting enables the use of the “posix_memalign()” call instead of “malloc()” when LAMMPS allocates large chunks or memory. Vector instructions on CPUs may become more efficient, if dynamically allocated memory is aligned on larger-than-default byte boundaries. On most current operating systems, the “malloc()” implementation returns pointers that are aligned to 16-byte boundaries. Using SSE vector instructions efficiently, however, requires memory blocks being aligned on 64-byte boundaries.

**CMake build**

```
-D LAMMPS_MEMALIGN=value  # 0, 8, 16, 32, 64 (default)
```

Use a `LAMMPS_MEMALIGN` value of 0 to disable using “posix_memalign()” and revert to using the “malloc()” C-library function instead. When compiling LAMMPS for Windows systems, “malloc()” will always be used and this setting is ignored.

**Traditional make**

```
LMP_INC = -DLAMMPS_MEMALIGN=value  # 8, 16, 32, 64
```

Do not set `-DLAMMPS_MEMALIGN`, if you want to have memory allocated with the “malloc()” function call instead. `-DLAMMPS_MEMALIGN cannot` be used on Windows, as Windows different function calls with different semantics for allocating aligned memory, that are not compatible with how LAMMPS manages its dynamical memory.

3.5.7 Workaround for long long integers

If your system or MPI version does not recognize “long long” data types, the following setting will be needed. It converts “long long” to a “long” data type, which should be the desired 8-byte integer on those systems:

**CMake build**

```
-D LAMMPS_LONGLONG_TO_LONG=value  # yes or no (default)
```

**Traditional make**

```
LMP_INC = -DLAMMPS_LONGLONG_TO_LONG
```

3.5.8 Exception handling when using LAMMPS as a library

This setting is useful when external codes drive LAMMPS as a library. With this option enabled, LAMMPS errors do not kill the calling code. Instead, the call stack is unwound and control returns to the caller, e.g. to Python. Of course, the calling code has to be set up to catch exceptions thrown from within LAMMPS.

**CMake build**

```
-D LAMMPS_EXCEPTIONS=value  # yes or no (default)
```

**Traditional make**

```
LMP_INC = -DLAMMPS_EXCEPTIONS
```

**Note:** When LAMMPS is running in parallel, it is not always possible to cleanly recover from an exception since not all parallel ranks may throw an exception and thus other MPI ranks may get stuck waiting for messages from the ones with errors.

3.6 Include packages in build

In LAMMPS, a package is a group of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. In the src directory, each package is a sub-directory with the package name in capital letters.

An overview of packages is given on the Packages doc page. Brief overviews of each package are on the Packages details doc page.

When building LAMMPS, you can choose to include or exclude each package. In general there is no need to include a package if you never plan to use its features.

If you get a run-time error that a LAMMPS command or style is “unknown”, it is often because the command is contained in a package, and your build did not include that package. If the command or style is available in a package included in the LAMMPS distribution, the error message will indicate which package would be needed. Running LAMMPS with the \textit{-h} command-line switch will print all optional commands and packages that were enabled when building that executable.

For the majority of packages, if you follow the single step below to include it, you can then build LAMMPS exactly the same as you would without any packages installed. A few packages may require additional steps, as explained on the Build extras doc page.

These links take you to the extra instructions for those select packages:

<table>
<thead>
<tr>
<th>COMPRESS</th>
<th>GPU</th>
<th>KIM</th>
<th>KOKKOS</th>
<th>LATTE</th>
<th>MESSAGE</th>
</tr>

<td>USER-VTK</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3.6. Include packages in build
The mechanism for including packages is simple but different for CMake versus make.

**CMake build**

```
-D PKG_NAME=value  # yes or no (default)
```

Examples:

```
-D PKG_MANYBODY=yes
-D PKG_USER-INTEL=yes
```

All standard and user packages are included the same way. Note that USER packages have a hyphen between USER and the rest of the package name, not an underscore.

See the shortcut section below for how to install many packages at once with CMake.

**Note:** If you switch between building with CMake and make builds, no packages in the `src` directory can be installed when you invoke `cmake`. CMake will give an error if that is not the case, indicating how you can un-install all packages in the `src` dir.

**Traditional make**

```
cd lammps/src
make ps           # check which packages are currently installed
make yes-name    # install a package with name
make no-name     # un-install a package with name
make mpi         # build LAMMPS with whatever packages are now installed
```

Examples:

```
make no-rigid
make yes-user-intel
```

All standard and user packages are included the same way.

See the shortcut section below for how to install many packages at once with make.

**Note:** You must always re-build LAMMPS (via make) after installing or un-installing a package, for the action to take effect. The included dependency tracking will make certain only files that are required to be rebuilt are recompiled.

**Note:** You cannot install or un-install packages and build LAMMPS in a single make command with multiple targets, e.g. `make yes-colloid mpi`. This is because the make procedure creates a list of source files that will be out-of-date for the build if the package configuration changes within the same command. You can include or exclude multiple packages in a single make command, e.g. `make yes-colloid no-manybody`.  

---

48 Chapter 3. Build LAMMPS
3.6.1 Information for both build systems

Almost all packages can be included or excluded in a LAMMPS build, independent of the other packages. However, some packages include files derived from files in other packages. LAMMPS checks for this and does the right thing. Individual files are only included if their dependencies are already included. Likewise, if a package is excluded, other files dependent on that package are also excluded.

Note: By default no package is installed. Prior to August 2018, however, if you downloaded a tarball, 3 packages (KSPACE, MANYBODY, MOLECULE) were pre-installed via the traditional make procedure in the src directory. That is no longer the case, so that CMake will build as-is without needing to un-install those packages.

CMake presets for installing many packages

Instead of specifying all the CMake options via the command-line, CMake allows initializing its settings cache using script files. These are regular CMake files which can manipulate and set CMake variables (which represent selected options), and can also contain control flow constructs for more complex operations.

LAMMPS includes several of these files to define configuration “presets”, similar to the options that exist for the Make based system. Using these files you can enable/disable portions of the available packages in LAMMPS. If you need a custom preset you can take one of them as a starting point and customize it to your needs.

```
cmake -C ../cmake/presets/minimal.cmake [OPTIONS] ../cmake # enable just a few core packages

cmake -C ../cmake/presets/most.cmake [OPTIONS] ../cmake # enable most packages

cmake -C ../cmake/presets/download.cmake [OPTIONS] ../cmake # download sources or potential files

cmake -C ../cmake/presets/nolib.cmake [OPTIONS] ../cmake # disable packages that do require extra libraries or tools

cmake -C ../cmake/presets/clang.cmake [OPTIONS] ../cmake # change settings to use the Clang compilers by default

cmake -C ../cmake/presets/intel.cmake [OPTIONS] ../cmake # change settings to use the Intel compilers by default

cmake -C ../cmake/presets/all_on.cmake [OPTIONS] ../cmake # enable all packages

cmake -C ../cmake/presets/all_off.cmake [OPTIONS] ../cmake # disable all packages

mingw64-cmake -C ../cmake/presets/mingw-cross.cmake [OPTIONS] ../cmake # compile with MinGW cross compilers
```

Note: Running cmake this way manipulates the CMake settings cache in your current build directory. You can combine multiple presets and options in a single cmake run, or change settings incrementally by running cmake with new flags.
Example

```bash
# build LAMMPS with most commonly used packages, but then remove
# those requiring additional library or tools, but still enable
# GPU package and configure it for using CUDA. You can run.
mkdir build
cd build
cmake -C ../cmake/presets/most.cmake -C ../cmake/presets/nolib.cmake -D PKG_GPU=on -D
    GPU_API=cuda ../cmake

# to add another package, say BODY to the previous configuration you can run:
cmake -D PKG_BODY=on .

# to reset the package selection from above to the default of no packages
# but leaving all other settings untouched. You can run:
cmake -C ../cmake/presets/no_all.cmake .
```

### 3.6.2 Make shortcuts for installing many packages

The following commands are useful for managing package source files and their installation when building LAMMPS via traditional make. Just type `make` in `lammps/src` to see a one-line summary.

These commands install/uninstall sets of packages:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>make yes-all</code></td>
<td>Install all packages</td>
</tr>
<tr>
<td><code>make no-all</code></td>
<td>Uninstall all packages</td>
</tr>
<tr>
<td><code>make yes-standard</code> or <code>make yes-std</code></td>
<td>Install standard packages</td>
</tr>
<tr>
<td><code>make no-standard</code> or <code>make no-std</code></td>
<td>Uninstall standard packages</td>
</tr>
<tr>
<td><code>make yes-user</code></td>
<td>Install user packages</td>
</tr>
<tr>
<td><code>make no-user</code></td>
<td>Uninstall user packages</td>
</tr>
<tr>
<td><code>make yes-lib</code></td>
<td>Install packages that require extra libraries</td>
</tr>
<tr>
<td><code>make no-lib</code></td>
<td>Uninstall packages that require extra libraries</td>
</tr>
<tr>
<td><code>make yes-ext</code></td>
<td>Install packages that require external libraries</td>
</tr>
<tr>
<td><code>make no-ext</code></td>
<td>Uninstall packages that require external libraries</td>
</tr>
</tbody>
</table>

which install/uninstall various sets of packages. Typing `make package` will list all the these commands.

**Note:** Installing or un-installing a package for the make based build process works by simply copying files back and forth between the main source directory `src` and the sub-directories with the package name (e.g. `src/KSPACE`, `src/USER-ATC`), so that the files are included or excluded when LAMMPS is built. Only source files in the `src` folder will be compiled.

The following make commands help manage files that exist in both the `src` directory and in package sub-directories. You do not normally need to use these commands unless you are editing LAMMPS files or are installing a patch downloaded from the LAMMPS web site.

Type `make package-status` or `make ps` to show which packages are currently installed. For those that are installed, it will list any files that are different in the `src` directory and package sub-directory.

Type `make package-installed` or `make pi` to show which packages are currently installed, without listing the status of packages that are not installed.
Type `make package-update` or `make pu` to overwrite src files with files from the package sub-directories if the package is installed. It should be used after a patch has been applied, since patches only update the files in the package sub-directory, but not the src files.

Type `make package-overwrite` to overwrite files in the package sub-directories with src files.

Type `make package-diff` to list all differences between pairs of files in both the source directory and the package directory.

### 3.7 Packages with extra build options

When building with some packages, additional steps may be required, in addition to

<table>
<thead>
<tr>
<th>CMake build</th>
<th>Traditional make</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$ cmake -D PKG_NAME=yes</code></td>
<td><code>$ make yes-name</code></td>
</tr>
</tbody>
</table>

as described on the `Build_package` doc page.

For a CMake build there may be additional optional or required variables to set. For a build with make, a provided library under the lammps/lib directory may need to be built first. Or an external library may need to exist on your system or be downloaded and built. You may need to tell LAMMPS where it is found on your system.

This is the list of packages that may require additional steps.

<table>
<thead>
<tr>
<th>COMPRESS</th>
<th>GPU</th>
<th>KIM</th>
<th>KOKKOS</th>
<th>LATTE</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSGC</td>
<td>OPT</td>
<td>POEMS</td>
<td>PYTHON</td>
<td>VORONOI</td>
<td>USER-ADIOS</td>
</tr>
<tr>
<td>USER-ATC</td>
<td>USER-AWPMD</td>
<td>USER-COLVARS</td>
<td>USER-HSMD</td>
<td>USER-INTEL</td>
<td>USER-MESONT</td>
</tr>
<tr>
<td>USER-MOLFILE</td>
<td>USER-NETCDF</td>
<td>USER-PLUMED</td>
<td>USER-OMP</td>
<td>USER-QMMM</td>
<td>USER-QUIP</td>
</tr>
<tr>
<td>USER-SCAFACOS</td>
<td>USER-SMD</td>
<td>USER-VTK</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 3.7.1 COMPRESS package

To build with this package you must have the zlib compression library available on your system to build dump styles with a `/gz` suffix. There are also styles using the Zstandard library which have a `/zstd` suffix.

**CMake build**

If CMake cannot find the zlib library or include files, you can set these variables:

```
-D ZLIB_INCLUDE_DIR=path  # path to zlib.h header file
-D ZLIB_LIBRARY=path      # path to libz.a (.so) file
```

Support for Zstandard compression is auto-detected and for that CMake depends on the pkg-config tool to identify the necessary flags to compile with this library, so the corresponding `libzstandard.pc` file must be in a folder where pkg-config can find it, which may require adding it to the `PKG_CONFIG_PATH` environment variable.
Traditional make

To include support for Zstandard compression, -DLAMMPS_ZSTD must be added to the compiler flags. If make cannot find the libraries, you can edit the file lib/compress/Makefile.lammps to specify the paths and library names. This must be done before the package is installed.

3.7.2 GPU package

To build with this package, you must choose options for precision and which GPU hardware to build for. The GPU package currently supports three different types of backends: OpenCL, CUDA and HIP.

CMake build

```
-D GPU_API=value # value = opencl (default) or cuda or hip
-D GPU_PREC=value # precision setting
    # value = double or mixed (default) or single
-D OCL_TUNE=value # hardware choice for GPU_API=opencl
    # generic (default) or intel (Intel CPU) or fermi,
    # kepler, cypress (NVIDIA)
-D GPU_ARCH=value # primary GPU hardware choice for GPU_API=cuda
    # value = sm_XX, see below
    # default is sm_50
-D HIP_ARCH=value # primary GPU hardware choice for GPU_API=hip
    # value depends on selected HIP_PLATFORM
    # default is 'gfx906' for HIP_PLATFORM=hcc and 'sm_50'
    # for HIP_PLATFORM=nvcc
-D HIP_USE_DEVICE_SORT=value # enables GPU sorting
    # value = yes (default) or no
-D CUDPP_OPT=value # optimization setting for GPU_API=cuda
    # enables CUDA Performance Primitives Optimizations
    # value = yes (default) or no
-D CUDA_MPS_SUPPORT=value # enables some tweaks required to run with active nvidia-
    # cuda-mps daemon
    # value = yes or no (default)
```

GPU_ARCH settings for different GPU hardware is as follows:

- sm_12 or sm_13 for GT200 (supported by CUDA 3.2 until CUDA 6.5)
- sm_20 or sm_21 for Fermi (supported by CUDA 3.2 until CUDA 7.5)
- sm_30 for Kepler (supported since CUDA 5 and until CUDA 10.x)
- sm_35 or sm_37 for Kepler (supported since CUDA 5 and until CUDA 11.x)
- sm_50 or sm_52 for Maxwell (supported since CUDA 6)
- sm_60 or sm_61 for Pascal (supported since CUDA 8)
- sm_70 for Volta (supported since CUDA 9)
- sm_75 for Turing (supported since CUDA 10)
- sm_80 for Ampere (supported since CUDA 11)
A more detailed list can be found, for example, at Wikipedia's CUDA article

CMake can detect which version of the CUDA toolkit is used and thus will try to include support for all major GPU architectures supported by this toolkit. Thus the GPU_ARCH setting is merely an optimization, to have code for the preferred GPU architecture directly included rather than having to wait for the JIT compiler of the CUDA driver to translate it.

When building with CMake, you must NOT build the GPU library in lib/gpu using the traditional build procedure. CMake will detect files generated by that process and will terminate with an error and a suggestion for how to remove them.

If you are compiling with HIP, note that before running CMake you will have to set appropriate environment variables. Some variables such as HCC_AMDGPU_TARGET or CUDA_PATH are necessary for hipcc and the linker to work correctly.

```bash
# AMDGPU target
export HIP_PLATFORM=hcc
export HCC_AMDGPU_TARGET=gfx906
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=gfx906 -D CMAKE_CXX_COMPILER=hipcc ..
make -j 4
```

```bash
# CUDA target (not recommended, use GPU_ARCH=cuda)
# !!! DO NOT set CMAKE_CXX_COMPILER !!!
export HIP_PLATFORM=nvcc
export CUDA_PATH=/usr/local/cuda
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=sm_70 ..
make -j 4
```

**Traditional make**

Before building LAMMPS, you must build the GPU library in lib/gpu. You can do this manually if you prefer; follow the instructions in lib/gpu/README. Note that the GPU library uses MPI calls, so you must use the same MPI library (or the STUBS library) settings as the main LAMMPS code. This also applies to the -DLAMMPS_BIGBIG, -DLAMMPS_SMALLBIG, or -DLAMMPS_SMALLSMALL settings in whichever Makefile you use.

You can also build the library in one step from the lammps/src dir, using a command like these, which simply invoke the lib/gpu/Install.py script with the specified args:

```bash
$ make lib-gpu
# print help message
$ make lib-gpu args="-b"  # build GPU library with default Makefile.linux
$ make lib-gpu args="-m xk7 -p single -o xk7.single"  # create new Makefile.xk7.
  -single, altered for single-precision
$ make lib-gpu args="-m mpi -a sm_60 -p mixed -b"  # build GPU library with mixed-
  -precision and P100 using other settings in Makefile.mpi
```

Note that this procedure starts with a Makefile.machine in lib/gpu, as specified by the “-m” switch. For your convenience, machine makefiles for “mpi” and “serial” are provided, which have the same settings as the corresponding machine makefiles in the main LAMMPS source folder. In addition you can alter 4 important settings in the Makefile.machine you start from via the corresponding -c, -a, -p, -e switches (as in the examples above), and also save a copy of the new Makefile if desired:

- CUDA_HOME = where NVIDIA CUDA software is installed on your system
- CUDA_ARCH = sm_XX, what GPU hardware you have, same as CMake GPU_ARCH above
- CUDA_PRECISION = precision (double, mixed, single)
- EXTRAMAKE = which Makefile.lammps.* file to copy to Makefile.lammps

3.7. Packages with extra build options
The file Makefile.linux_multi is set up to include support for multiple GPU architectures as supported by the CUDA toolkit in use. This is done through using the “--gencode” flag, which can be used multiple times and thus support all GPU architectures supported by your CUDA compiler.

If the library build is successful, 3 files should be created: `lib/gpu/libgpu.a`, `lib/gpu/nvc_get_devices`, and `lib/gpu/Makefile.lammps`. The latter has settings that enable LAMMPS to link with CUDA libraries. If the settings in `Makefile.lammps` for your machine are not correct, the LAMMPS build will fail, and `lib/gpu/Makefile.lammps` may need to be edited.

**Note:** If you re-build the GPU library in `lib/gpu`, you should always un-install the GPU package in `lammps/src`, then re-install it and re-build LAMMPS. This is because the compilation of files in the GPU package uses the library settings from the `lib/gpu/Makefile.machine` used to build the GPU library.

### 3.7.3 KIM package

To build with this package, the KIM library with API v2 must be downloaded and built on your system. It must include the KIM models that you want to use with LAMMPS.

If you would like to use the `kim_query` command, you also need to have libcurl installed with the matching development headers and the curl-config tool.

If you would like to use the `kim_property` command, you need to build LAMMPS with the PYTHON package installed and linked to Python 3.6 or later. See the [PYTHON package build info](#) for more details on this. After successfully building LAMMPS with Python, you also need to install the `kim-property` Python package, which can be easily done using `pip` as `pip install kim-property` or from the [conda-forge](#) channel as `conda install kim-property` if LAMMPS is built in Conda. More detailed information is available at: [kim-property installation](#).

In addition to installing the KIM API, it is also necessary to install the library of KIM models (interatomic potentials). See [Obtaining KIM Models](#) to learn how to install a pre-build binary of the OpenKIM Repository of Models. See the list of all KIM models here: [https://openkim.org/browse/models](https://openkim.org/browse/models)

(Also note that when downloading and installing from source the KIM API library with all its models, may take a long time (tens of minutes to hours) to build. Of course you only need to do that once.)

#### CMake build

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-D DOWNLOAD_KIM=value</code></td>
<td># download OpenKIM API v2 for build, value = no (default) or yes</td>
</tr>
<tr>
<td><code>-D LMP_DEBUG_CURL=value</code></td>
<td># set libcurl verbose mode on/off, value = off (default) or on</td>
</tr>
<tr>
<td><code>-D LMP_NO_SSL_CHECK=value</code></td>
<td># tell libcurl to not verify the peer, value = no (default) or yes</td>
</tr>
</tbody>
</table>

If `DOWNLOAD_KIM` is set to yes (or on), the KIM API library will be downloaded and built inside the CMake build directory. If the KIM library is already installed on your system (in a location where CMake cannot find it), you may need to set the `PKG_CONFIG_PATH` environment variable so that libkim-api can be found, or run the command `source kim-api-activate`.

#### Traditional make
You can download and build the KIM library manually if you prefer; follow the instructions in lib/kim/README. You can also do this in one step from the lammps/src dir, using a command like these, which simply invoke the lib/kim/Install.py script with the specified args.

```bash
$ make lib-kim           # print help message
$ make lib-kim args="-b " # (re-)install KIM API lib with only example models
$ make lib-kim args="-b -a Glue_Ercolessi_Adams_A1_MO_324507536345_001" # ditto plus one model
$ make lib-kim args="-b -a everything"    # install KIM API lib with all models
$ make lib-kim args="-n -a EAM_Dynamo_Ackland_W__MO_141627196590_002"  # add one model or model driver
$ make lib-kim args="-p /usr/local"       # use an existing KIM API installation
$ make lib-kim args="-p /usr/local -a EAM_Dynamo_Ackland_W__MO_141627196590_002" # ditto but add one model or driver
```

Settings for debugging OpenKIM web queries discussed below need to be applied by adding them to the LMP_INC variable through editing the Makefile.machine you are using. For example:

```bash
LMP_INC = -DLMP_NO_SSL_CHECK
```

### Debugging OpenKIM web queries in LAMMPS

If LMP_DEBUG_CURL is set, the libcurl verbose mode will be turned on, and any libcurl calls within the KIM web query display a lot of information about libcurl operations. You hardly ever want this set in production use, you will almost always want this when you debug or report problems.

The libcurl library performs peer SSL certificate verification by default. This verification is done using a CA certificate store that the SSL library can use to make sure the peer’s server certificate is valid. If SSL reports an error (“certificate verify failed”) during the handshake and thus refuses further communicate with that server, you can set LMP_NO_SSL_CHECK to override that behavior. When LAMMPS is compiled with LMP_NO_SSL_CHECK set, libcurl does not verify the peer and connection attempts will succeed regardless of the names in the certificate. This option is insecure. As an alternative, you can specify your own CA cert path by setting the environment variable CURL_CA_BUNDLE to the path of your choice. A call to the KIM web query would get this value from the environment variable.

#### 3.7.4 KOKKOS package

Using the KOKKOS package requires choosing several settings. You have to select whether you want to compile with parallelization on the host and whether you want to include offloading of calculations to a device (e.g. a GPU). The default setting is to have no host parallelization and no device offloading. In addition, you can select the hardware architecture to select the instruction set. Since most hardware is backward compatible, you may choose settings for an older architecture to have an executable that will run on this and newer architectures.

**Note:** If you run Kokkos on a different GPU architecture than what LAMMPS was compiled with, there will be a delay during device initialization while the just-in-time compiler is recompiling all GPU kernels for the new hardware. This is, however, only supported for GPUs of the same major hardware version and different minor hardware versions, e.g. 5.0 and 5.2 but not 5.2 and 6.0. LAMMPS will abort with an error message indicating a mismatch, if that happens.
The settings discussed below have been tested with LAMMPS and are confirmed to work. Kokkos is an active project with ongoing improvements and projects working on including support for additional architectures. More information on Kokkos can be found on the Kokkos GitHub project.

Available Architecture settings

These are the possible choices for the Kokkos architecture ID. They must be specified in uppercase.

<table>

This list was last updated for version 3.2 of the Kokkos library.

Basic CMake build settings:

For multicore CPUs using OpenMP, set these 2 variables.

```
-D Kokkos_ARCH_HOSTARCH=yes   # HOSTARCH = HOST from list above
```

(continues on next page)
(-D Kokkos_ENABLE_OPENMP=yes
-D BUILD_OMP=yes

Please note that enabling OpenMP for KOKKOS requires that OpenMP is also enabled for the rest of LAMMPS.

For Intel KNLs using OpenMP, set these variables:

(-D Kokkos_ARCH_KNL=yes
-D Kokkos_ENABLE_OPENMP=yes

For NVIDIA GPUs using CUDA, set these variables:

(-D Kokkos_ARCH_HOSTARCH=yes
-D Kokkos_ENABLE_CUDA=yes
-D Kokkos_ENABLE_OPENMP=yes
-D CMAKE_CXX_COMPILER=wrapper

This will also enable executing FFTs on the GPU, either via the internal KISSFFT library, or by preference - with the cuFFT library bundled with the CUDA toolkit, depending on whether CMake can identify its location. The wrapper value for CMAKE_CXX_COMPILER variable is the path to the CUDA nvcc compiler wrapper provided in the Kokkos library: lib/kokkos/bin/nvcc_wrapper. The setting should include the full path name to the wrapper, e.g.

(-D CMAKE_CXX_COMPILER=$(HOME)/lammps/lib/kokkos/bin/nvcc_wrapper

To simplify compilation, three preset files are included in the cmake/presets folder, kokkos-serial.cmake, kokkos-openmp.cmake, and kokkos-cuda.cmake. They will enable the KOKKOS package and enable some hardware choice. So to compile with OpenMP host parallelization, CUDA device parallelization (for GPUs with CC 5.0 and up) with some common packages enabled, you can do the following:

mkdir build-kokkos-cuda
cd build-kokkos-cuda
cmake -C ../cmake/presets/minimal.cmake -C ../cmake/presets/kokkos-cuda.
cmake ../cmake

cmake --build .

Basic traditional make settings:

Choose which hardware to support in Makefile.machine via KOKKOS_DEVICES and KOKKOS_ARCH settings. See the src/MAKE/OPTIONS/Makefile.kokkos* files for examples.

For multicore CPUs using OpenMP:

KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = HOSTARCH # HOSTARCH = HOST from list above

For Intel KNLs using OpenMP:

KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = KNL

For NVIDIA GPUs using CUDA:

KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = HOSTARCH # HOSTARCH = HOST from list above

KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = HOSTARCH
d KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = KNL

3.7. Packages with extra build options
Advanced KOKKOS compilation settings

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. Below are some examples that may be useful in combination with LAMMPS. For the full list (which keeps changing as the Kokkos package itself evolves), please consult the Kokkos library documentation.

As an alternative to using multi-threading via OpenMP (-DKokkos_ENABLE_OPENMP=on or KOKKOS_DEVICES=OpenMP) it is also possible to use Posix threads directly (-DKokkos_ENABLE_PTHREAD=on or KOKKOS_DEVICES=Pthread). While binding of threads to individual or groups of CPU cores is managed in OpenMP with environment variables, you need assistance from either the “hwloc” or “libnuma” library for the Pthread thread parallelization option. To enable use with CMake: -DKokkos_ENABLE_HWLOC=on or -DKokkos_ENABLE_LIBNUMA=on; and with conventional make: KOKKOS_USE_TPLS=hwloc or KOKKOS_USE_TPLS=libnuma.

The CMake option -DKokkos_ENABLE_LIBRT=on or the makefile setting KOKKOS_USE_TPLS=librt enables the use of a more accurate timer mechanism on many Unix-like platforms for internal profiling.

The CMake option -DKokkos_ENABLE_DEBUG=on or the makefile setting KOKKOS_DEBUG=yes enables printing of run-time debugging information that can be useful. It also enables runtime bounds checking on Kokkos data structures. As to be expected, enabling this option will negatively impact the performance and thus is only recommended when developing a Kokkos-enabled style in LAMMPS.

The CMake option -DKokkos_ENABLE_CUDA_UVM=on or the makefile setting KOKKOS_CUDA_OPTIONS=enable_lambda,force_uvm enables the use of CUDA “Unified Virtual Memory” (UVM) in Kokkos. UVM allows to transparently use RAM on the host to supplement the memory used on the GPU (with some performance penalty) and thus enables running larger problems that would otherwise not fit into the RAM on the GPU.

Please note, that the LAMMPS KOKKOS package must always be compiled with the enable_lambda option when using GPUs. The CMake configuration will thus always enable it.
3.7.5 LATTE package

To build with this package, you must download and build the LATTE library.

**CMake build**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-D DOWNLOAD_LATTE=value</td>
<td># download LATTE for build, value = no (default) or yes</td>
</tr>
<tr>
<td></td>
<td>or yes</td>
</tr>
<tr>
<td>-D LATTE_LIBRARY=path</td>
<td># LATTE library file (only needed if a custom location)</td>
</tr>
</tbody>
</table>

If `DOWNLOAD_LATTE` is set, the LATTE library will be downloaded and built inside the CMake build directory. If the LATTE library is already on your system (in a location CMake cannot find it), `LATTE_LIBRARY` is the filename (plus path) of the LATTE library file, not the directory the library file is in.

**Traditional make**

You can download and build the LATTE library manually if you prefer; follow the instructions in `lib/latte/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invokes the `lib/latte/Install.py` script with the specified args:

```
$ make lib-latte  # print help message
$ make lib-latte args="-b" # download and build in lib/latte/LATTE-master
$ make lib-latte args="-p $HOME/latte" # use existing LATTE installation
$ make lib-latte args="-b -m gfortran" # download and build in lib/latte and copy Makefile.lammps
```

Note that 3 symbolic (soft) links, includelink and liblink and filelink.o, are created in `lib/latte` to point to required folders and files in the LATTE home directory. When LAMMPS itself is built it will use these links. You should also check that the `Makefile.lammps` file you create is appropriate for the compiler you use on your system to build LATTE.

3.7.6 MESSAGE package

This package can optionally include support for messaging via sockets, using the open-source ZeroMQ library, which must be installed on your system.

**CMake build**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-D MESSAGE_ZMQ=value</td>
<td># build with ZeroMQ support, value = no (default) or yes</td>
</tr>
<tr>
<td></td>
<td>or yes</td>
</tr>
<tr>
<td>-D ZMQ_LIBRARY=path</td>
<td># ZeroMQ library file (only needed if a custom location)</td>
</tr>
<tr>
<td>-D ZMQ_INCLUDE_DIR=path</td>
<td># ZeroMQ include directory (only needed if a custom location)</td>
</tr>
</tbody>
</table>

### 3.7. Packages with extra build options
Traditional make

Before building LAMMPS, you must build the CSlib library in `lib/message`. You can build the CSlib library manually if you prefer; follow the instructions in `lib/message/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/message/Install.py` script with the specified args:

- `$ make lib-message` # print help message
- `$ make lib-message args="-m -z"` # build with MPI and socket (ZMQ) support
- `$ make lib-message args="-s"` # build as serial lib with no ZMQ support

The build should produce two files: `lib/message/cslib/src/libmessage.a` and `lib/message/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings to link with the ZeroMQ library if requested in the build.

3.7.7 MSCG package

To build with this package, you must download and build the MS-CG library. Building the MS-CG library requires that the GSL (GNU Scientific Library) headers and libraries are installed on your machine. See the `lib/mscg/README` and `MSCG/Install` files for more details.

CMake build

- `-D DOWNLOAD_MSCG=value` # download MSCG for build, value = no (default) or yes
- `-D MSCG_LIBRARY=path` # MSCG library file (only needed if a custom location)
- `-D MSCG_INCLUDE_DIR=path` # MSCG include directory (only needed if a custom location)

If `DOWNLOAD_MSCG` is set, the MSCG library will be downloaded and built inside the CMake build directory. If the MSCG library is already on your system (in a location CMake cannot find it), `MSCG_LIBRARY` is the filename (plus path) of the MSCG library file, not the directory the library file is in. `MSCG_INCLUDE_DIR` is the directory the MSCG include file is in.

Traditional make

You can download and build the MS-CG library manually if you prefer; follow the instructions in `lib/mscg/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/mscg/Install.py` script with the specified args:

- `$ make lib-mscg` # print help message
- `$ make lib-mscg args="-b -m serial"` # download and build in `lib/mscg/MSCG-release-master` with the settings compatible with "make serial"
- `$ make lib-mscg args="-b -m mpi"` # download and build in `lib/mscg/MSCG-release-master`

(continues on next page)
Note that 2 symbolic (soft) links, includelink and liblink, will be created in lib/mscg to point to the MS-CG src/installation dir. When LAMMPS is built in src it will use these links. You should not need to edit the lib/mscg/Makefile.lammps file.

### 3.7.8 OPT package

**CMake build**

No additional settings are needed besides `-D PKG_OPT=yes`

**Traditional make**

The compiler flag `-restrict` must be used to build LAMMPS with the OPT package when using Intel compilers. It should be added to the `CCFLAGS` line of your `Makefile.machine`. See `src/MAKE/OPTIONS/Makefile.opt` for an example.

### 3.7.9 POEMS package

**CMake build**

No additional settings are needed besides `-D PKG_OPT=yes`

**Traditional make**

Before building LAMMPS, you must build the POEMS library in `lib/poems`. You can do this manually if you prefer; follow the instructions in `lib/poems/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/poems/Install.py` script with the specified args:

```
$ make lib-poems # print help message
$ make lib-poems args="-m serial" # build with GNU g++ compiler (settings as with "make serial")
$ make lib-poems args="-m mpi" # build with default MPI C++ compiler (settings as with "make mpi")
$ make lib-poems args="-m icc" # build with Intel icc compiler
```

The build should produce two files: `lib/poems/libpoems.a` and `lib/poems/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the POEMS library (though typically the settings are just blank). If necessary, you
can edit/create a new \texttt{lib/poems/Makefile.machine} file for your system, which should define an \texttt{EXTRAMAKE} variable to specify a corresponding \texttt{Makefile.lammps.machine} file.

### 3.7.10 PYTHON package

Building with the PYTHON package requires you have a the Python development headers and library available on your system, which needs to be a Python 2.7 version or a Python 3.x version. Since support for Python 2.x has ended, using Python 3.x is strongly recommended. See \texttt{lib/python/README} for additional details.

**CMake build**

- \texttt{-D PYTHON\_EXECUTABLE=path} \# path to Python executable to use

Without this setting, CMake will guess the default Python version on your system. To use a different Python version, you can either create a virtualenv, activate it and then run \texttt{cmake}. Or you can set the \texttt{PYTHON\_EXECUTABLE} variable to specify which Python interpreter should be used. Note that you will also need to have the development headers installed for this version, e.g. python2-devel.

**Traditional make**

The build uses the \texttt{lib/python/Makefile.lammps} file in the compile/link process to find Python. You should only need to create a new \texttt{Makefile.lammps.*} file (and copy it to \texttt{Makefile.lammps}) if the LAMMPS build fails.

### 3.7.11 VORONOI package

To build with this package, you must download and build the Voro++ library or install a binary package provided by your operating system.

**CMake build**

- \texttt{-D DOWNLOAD\_VORO=value} \# download Voro++ for build, value = no (default) or yes
- \texttt{-D VORO\_LIBRARY=path} \# Voro++ library file (only needed if at custom location)
- \texttt{-D VORO\_INCLUDE\_DIR=path} \# Voro++ include directory (only needed if at custom location)

If \texttt{DOWNLOAD\_VORO} is set, the Voro++ library will be downloaded and built inside the CMake build directory. If the Voro++ library is already on your system (in a location CMake cannot find it), \texttt{VORO\_LIBRARY} is the filename (plus path) of the Voro++ library file, not the directory the library file is in. \texttt{VORO\_INCLUDE\_DIR} is the directory the Voro++ include file is in.

**Traditional make**
You can download and build the Voro++ library manually if you prefer; follow the instructions in lib/voronoi/README. You can also do it in one step from the lammps/src dir, using a command like these, which simply invoke the lib/voronoi/Install.py script with the specified args:

$$\begin{align*}
\$ \text{make lib-voronoi} & \quad \text{# print help message} \\
\$ \text{make lib-voronoi args="-b"} & \quad \text{# download and build the default version in lib/voronoi/voro++-<version>} \\
\$ \text{make lib-voronoi args="-p $HOME/voro++"} & \quad \text{# use existing Voro++ installation in $HOME/voro++} \\
\$ \text{make lib-voronoi args="-b -v voro++0.4.6"} & \quad \text{# download and build the 0.4.6 version in lib/voronoi/voro++-0.4.6}
\end{align*}$$

Note that 2 symbolic (soft) links, includelink and liblink, are created in lib/voronoi to point to the Voro++ source dir. When LAMMPS builds in src it will use these links. You should not need to edit the lib/voronoi/Makefile.lammps file.

### 3.7.12 USER-ADIOS package

The USER-ADIOS package requires the ADIOS I/O library, version 2.3.1 or newer. Make sure that you have ADIOS built either with or without MPI to match if you build LAMMPS with or without MPI. ADIOS compilation settings for LAMMPS are automatically detected, if the PATH and LD_LIBRARY_PATH environment variables have been updated for the local ADIOS installation and the instructions below are followed for the respective build systems.

**CMake build**

-\D ADIOS2_DIR=path \quad \text{# path is where ADIOS 2.x is installed}
-\D PKG_USER-ADIOS=yes

**Traditional make**

Turn on the USER-ADIOS package before building LAMMPS. If the ADIOS 2.x software is installed in PATH, there is nothing else to do:

$$\$ \text{make yes-user-adios}$$

otherwise, set ADIOS2_DIR environment variable when turning on the package:

$$\$ \text{ADIOS2_DIR=path make yes-user-adios} \quad \text{# path is where ADIOS 2.x is installed}$$
3.7.13 USER-ATC package

The USER-ATC package requires the MANYBODY package also be installed.

CMake build

No additional settings are needed besides -D PKG_USER-ATC=yes and -D PKG_MANYBODY=yes.

Traditional make

Before building LAMMPS, you must build the ATC library in lib/atc. You can do this manually if you prefer; follow the instructions in lib/atc/README. You can also do it in one step from the lammps/src dir, using a command like these, which simply invoke the lib/atc/Install.py script with the specified args:

$ make lib-atc
$ make lib-atc args="-m serial" # build with GNU g++ compiler and MPI
$ make lib-atc args="-m mpi" # build with default MPI compiler
$ make lib-atc args="-m icc" # build with Intel icc compiler

The build should produce two files: lib/atc/libatc.a and lib/atc/Makefile.lammps. The latter is copied from an existing Makefile.lammps.* and has settings needed to build LAMMPS with the ATC library. If necessary, you can edit/create a new lib/atc/Makefile.machine file for your system, which should define an EXTRAMAKE variable to specify a corresponding Makefile.lammps.<machine> file.

Note that the Makefile.lammps file has settings for the BLAS and LAPACK linear algebra libraries. As explained in lib/atc/README these can either exist on your system, or you can use the files provided in lib/linalg. In the latter case you also need to build the library in lib/linalg with a command like these:

$ make lib-linalg
$ make lib-linalg args="-m serial" # build with GNU Fortran compiler
$ make lib-linalg args="-m mpi" # build with default MPI Fortran compiler
$ make lib-linalg args="-m gfortran" # build with GNU Fortran compiler

3.7.14 USER-AWPMD package

CMake build

No additional settings are needed besides -D PKG_USER-AQPMD=yes.

Traditional make

Before building LAMMPS, you must build the AWPMD library in lib/awpmd. You can do this manually if you prefer; follow the instructions in lib/awpmd/README. You can also do it in one step from
the lammps/src dir, using a command like these, which simply invoke the lib/awpmd/Install.py script with the specified args:

```
$ make lib-awpmd args="-m serial" # build with GNU g++ compiler and MPI
# STUBS (settings as with "make serial")
$ make lib-awpmd args="-m mpi" # build with default MPI compiler
# (settings as with "make mpi")
$ make lib-awpmd args="-m icc" # build with Intel icc compiler
```

The build should produce two files: lib/awpmd/libawpmd.a and lib/awpmd/Makefile.lammps. The latter is copied from an existing Makefile.lammps.* and has settings needed to build LAMMPS with the AWPMD library. If necessary, you can edit/create a new lib/awpmd/Makefile.lammps.<machine> machine file for your system, which should define an EXTRAMAKE variable to specify a corresponding Makefile.lammps.<machine> file.

Note that the Makefile.lammps file has settings for the BLAS and LAPACK linear algebra libraries. As explained in lib/awpmd/README these can either exist on your system, or you can use the files provided in lib/linalg. In the latter case you also need to build the library in lib/linalg with a command like these:

```
$ make lib-linalg # print help message
$ make lib-linalg args="-m serial" # build with GNU Fortran compiler
# (settings as with "make serial")
$ make lib-linalg args="-m mpi" # build with default MPI Fortran compiler
# (settings as with "make mpi")
$ make lib-linalg args="-m gfortran" # build with GNU Fortran compiler
```

---

### 3.7.15 USER-COLVARS package

This package includes the Colvars library into the LAMMPS distribution, which can be built for the most part with all major versions of the C++ language.

**CMake build**

This is the recommended build procedure for using Colvars in LAMMPS. No additional settings are normally needed besides `-D PKG_USER-COLVARS=yes`.

**Traditional make**

Before building LAMMPS, one must build the Colvars library in lib/colvars.

This can be done manually in the same folder by using or adapting one of the provided Makefiles: for example, Makefile.g++ for the GNU C++ compiler. C++11 compatibility may need to be enabled for some older compilers (as is done in the example makefile).

In general, it is safer to use build setting consistent with the rest of LAMMPS. This is best carried out from the LAMMPS src directory using a command like these, which simply invoke the lib/colvars/Install.py script with the specified args:
The “machine” argument of the “-m” flag is used to find a Makefile.machine to use as build recipe. If it does not already exist in lib/colvars, it will be auto-generated by using compiler flags consistent with those parsed from the core LAMMPS makefiles.

Optional flags may be specified as environment variables:

```
$ COLVARS_DEBUG=yes make lib-colvars args="-m machine"  # Build with debug code (much slower)
$ COLVARS_LEPTON=no make lib-colvars args="-m machine"  # Build without Lepton (included otherwise)
```

The build should produce two files: the library lib/colvars/libcolvars.a (which also includes Lepton objects if enabled) and the specification file lib/colvars/Makefile.lammps. The latter is auto-generated, and normally does not need to be edited.

---

### 3.7.16 USER-PLUMED package

Before building LAMMPS with this package, you must first build PLUMED. PLUMED can be built as part of the LAMMPS build or installed separately from LAMMPS using the generic PLUMED installation instructions. The USER-PLUMED package has been tested to work with Plumed versions 2.4.x, 2.5.x, and 2.6.x and will error out, when trying to run calculations with a different version of the Plumed kernel.

PLUMED can be linked into MD codes in three different modes: static, shared, and runtime. With the “static” mode, all the code that PLUMED requires is linked statically into LAMMPS. LAMMPS is then fully independent from the PLUMED installation, but you have to rebuild/relink it in order to update the PLUMED code inside it. With the “shared” linkage mode, LAMMPS is linked to a shared library that contains the PLUMED code. This library should preferably be installed in a globally accessible location. When PLUMED is linked in this way the same library can be used by multiple MD packages. Furthermore, the PLUMED library LAMMPS uses can be updated without the need for a recompile of LAMMPS for as long as the shared PLUMED library is ABI-compatible.

The third linkage mode is “runtime” which allows the user to specify which PLUMED kernel should be used at runtime by using the PLUMED_KERNEL environment variable. This variable should point to the location of the libplumedKernel.so dynamical shared object, which is then loaded at runtime. This mode of linking is particularly convenient for doing PLUMED development and comparing multiple PLUMED versions as these sorts of comparisons can be done without recompiling the hosting MD code. All three linkage modes are supported by LAMMPS on selected operating systems (e.g. Linux) and using either CMake or traditional make build. The “static” mode should be the most portable, while the “runtime” mode support in LAMMPS makes the most assumptions about operating system and compiler environment. If one mode does not work, try a different one, switch to a different build system, consider a global PLUMED installation or consider downloading PLUMED during the LAMMPS build.

#### CMake build

When the `-D PKG_USER-PLUMED=yes` flag is included in the cmake command you must ensure that GSL is installed in locations that are specified in your environment. There are then two additional variables that control the manner in which PLUMED is obtained and linked into LAMMPS.
If `DOWNLOAD_PLUMED` is set to “yes”, the PLUMED library will be downloaded (the version of PLUMED that will be downloaded is hard-coded to a vetted version of PLUMED, usually a recent stable release version) and built inside the CMake build directory. If `DOWNLOAD_PLUMED` is set to “no” (the default), CMake will try to detect and link to an installed version of PLUMED. For this to work, the PLUMED library has to be installed into a location where the `pkg-config` tool can find it or the `PKG_CONFIG_PATH` environment variable has to be set up accordingly. PLUMED should be installed in such a location if you compile it using the default `make`; make install commands.

The `PLUMED_MODE` setting determines the linkage mode for the PLUMED library. The allowed values for this flag are “static” (default), “shared”, or “runtime”. If you want to switch the linkage mode, just re-run CMake with a different setting. For a discussion of PLUMED linkage modes, please see above. When `DOWNLOAD_PLUMED` is enabled the static linkage mode is recommended.

### Traditional make

PLUMED needs to be installed before the USER-PLUMED package is installed so that LAMMPS can find the right settings when compiling and linking the LAMMPS executable. You can either download and build PLUMED inside the LAMMPS plumed library folder or use a previously installed PLUMED library and point LAMMPS to its location. You also have to choose the linkage mode: “static” (default), “shared” or “runtime”. For a discussion of PLUMED linkage modes, please see above.

Download/compilation/configuration of the plumed library can be done from the src folder through the following make args:

```bash
$ make lib-plumed               # print help message
$ make lib-plumed args="-b"    # download and build PLUMED in lib/plumed/plumed2
$ make lib-plumed args="-p $HOME/.local" # use existing PLUMED installation in $HOME/.local
$ make lib-plumed args="-p /usr/local -m shared" # use existing PLUMED installation in /usr/local and use shared linkage mode
```

Note that 2 symbolic (soft) links, `includelink` and `liblink` are created in `lib/plumed` that point to the location of the PLUMED build to use. A new file `lib/plumed/Makefile.lammps` is also created with settings suitable for LAMMPS to compile and link PLUMED using the desired linkage mode. After this step is completed, you can install the USER-PLUMED package and compile LAMMPS in the usual manner:

```bash
$ make yes-user-plumed
$ make machine
```

Once this compilation completes you should be able to run LAMMPS in the usual way. For shared linkage mode, `libplumed.so` must be found by the LAMMPS executable, which on many operating systems means, you have to set the `LD_LIBRARY_PATH` environment variable accordingly.

Support for the different linkage modes in LAMMPS varies for different operating systems, using the static linkage is expected to be the most portable, and thus set to be the default.

If you want to change the linkage mode, you have to re-run “make lib-plumed” with the desired settings.
and do a re-install if the USER-PLUMED package with “make yes-user-plumed” to update the required
makefile settings with the changes in the lib/plumed folder.

3.7.17 USER-H5MD package

To build with this package you must have the HDF5 software package installed on your system, which should include
the h5cc compiler and the HDF5 library.

CMake build

No additional settings are needed besides `-D PKG_USER-H5MD=yes`.

This should auto-detect the H5MD library on your system. Several advanced CMake H5MD options exist
if you need to specify where it is installed. Use the cmake (terminal window) or cmake-gui (graphical)
tools to see these options and set them interactively from their user interfaces.

Traditional make

Before building LAMMPS, you must build the CH5MD library in `lib/h5md`. You can do this manually
if you prefer; follow the instructions in `lib/h5md/README`. You can also do it in one step from the
`lammps/src` dir, using a command like these, which simply invoke the `lib/h5md/Install.py` script with the specified args:

```
$ make lib-h5md               # print help message
$ make lib-h5md args="-m h5cc"  # build with h5cc compiler
```

The build should produce two files: `lib/h5md/libch5md.a` and `lib/h5md/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the system HDF5 library. If necessary, you can edit/create a new `lib/h5md/Makefile.machine` file for your system, which should define an EXTRAMAKE variable to specify a corresponding `Makefile.lammps.<machine>` file.

3.7.18 USER-INTEL package

To build with this package, you must choose which hardware you want to build for, either x86 CPUs or Intel KNLs
in offload mode. You should also typically install the USER-OMP package, as it can be used in tandem with the
USER-INTEL package to good effect, as explained on the USER-INTEL package page.

When using Intel compilers version 16.0 or later is required. You can also use the GNU or Clang compilers and they will provide performance improvements over regular styles and USER-OMP styles, but less so than with the Intel compilers. Please also note, that some compilers have been found to apply memory alignment constraints incompletely or incorrectly and thus can cause segmentation faults in otherwise correct code when using features from the USER-INTEL package.

CMake build
Traditional make

Choose which hardware to compile for in Makefile.machine via the following settings. See src/MAKE/OPTIONS/Makefile.intel_cpu* and Makefile.knl files for examples. and src/USER-INTEL/README for additional information.

For CPUs:

<table>
<thead>
<tr>
<th>OPTFLAGS</th>
<th>-xHost -O2 -fp-model fast=2 -no-prec-div -qoverride-limits -qopt-zmm-usage=high</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCFLAGS</td>
<td>-g -qopenmp -DLAMMPS_MEMALIGN=64 -no-offload -fno-alias -ansi-alias -restrict $(OPTFLAGS)</td>
</tr>
<tr>
<td>LINKFLAGS</td>
<td>-g -qopenmp $(OPTFLAGS)</td>
</tr>
<tr>
<td>LIB</td>
<td>-ltbbmalloc</td>
</tr>
</tbody>
</table>

For KNLS:

<table>
<thead>
<tr>
<th>OPTFLAGS</th>
<th>-xMIC-AVX512 -O2 -fp-model fast=2 -no-prec-div -qoverride-limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCFLAGS</td>
<td>-g -qopenmp -DLAMMPS_MEMALIGN=64 -no-offload -fno-alias -ansi-alias -restrict $(OPTFLAGS)</td>
</tr>
<tr>
<td>LINKFLAGS</td>
<td>-g -qopenmp $(OPTFLAGS)</td>
</tr>
<tr>
<td>LIB</td>
<td>-ltbbmalloc</td>
</tr>
</tbody>
</table>

In Long-range thread mode (LRT) a modified verlet style is used, that operates the Kspace calculation in a separate thread concurrently to other calculations. This has to be enabled in the `package intel` command at runtime. With the setting “threads” it used the pthreads library, while “c++11” will use the built-in thread support of C++11 compilers. The option “none” skips compilation of this feature. The default is to use “threads” if pthreads is available and otherwise “none”.

Best performance is achieved with Intel hardware, Intel compilers, as well as the Intel TBB and MKL libraries. However, the code also compiles, links, and runs with other compilers / hardware and without TBB and MKL.

### 3.7.19 USER-MESONT package

This package includes a library written in Fortran 90 in the lib/mesont folder, so a working Fortran 90 compiler is required to compile it. Also, the files with the force field data for running the bundled examples are not included in the source distribution. Instead they will be downloaded the first time this package is installed.

**CMake build**

No additional settings are needed besides `-D PKG_USER-MESONT=yes`

**Traditional make**
Before building LAMMPS, you must build the mesont library in lib/mesont. You can also do it in one step from the lammps/src dir, using a command like these, which simply invoke the lib/mesont/Install.py script with the specified args:

$ make lib-mesont # print help message
$ make lib-mesont args="-m gfortran" # build with GNU g++ compiler (settings as with "make serial")
$ make lib-mesont args="-m ifort" # build with Intel icc compiler

The build should produce two files: lib/mesont/libmesont.a and lib/mesont/Makefile.lammps. The latter is copied from an existing Makefile.lammps.* and has settings needed to build LAMMPS with the mesont library (though typically the settings contain only the Fortran runtime library). If necessary, you can edit/create a new lib/mesont/Makefile.machine file for your system, which should define an EXTRAMAKE variable to specify a corresponding Makefile.lammps.machine file.

### 3.7.20 USER-MOLFILE package

#### CMake build

- `MOLFILE_INCLUDE_DIR=path` # (optional) path where VMD molfile plugin headers are installed
- `PKG_USER-MOLFILE=yes`

Using `-D PKG_USER-MOLFILE=yes` enables the package, and setting `-D MOLFILE_INCLUDE_DIR` allows to provide a custom location for the molfile plugin header files. These should match the ABI of the plugin files used, and thus one typically sets them to include folder of the local VMD installation in use. LAMMPS ships with a couple of default header files that correspond to a popular VMD version, usually the latest release.

#### Traditional make

The `lib/molfile/Makefile.lammps` file has a setting for a dynamic loading library libdl.a that is typically present on all systems. It is required for LAMMPS to link with this package. If the setting is not valid for your system, you will need to edit the Makefile.lammps file. See `lib/molfile/README` and `lib/molfile/Makefile.lammps` for details. It is also possible to configure a different folder with the VMD molfile plugin header files. LAMMPS ships with a couple of default headers, but these are not compatible with all VMD versions, so it is often best to change this setting to the location of the same include files of the local VMD installation in use.
3.7.21 USER-NETCDF package

To build with this package you must have the NetCDF library installed on your system.

**CMake build**

No additional settings are needed besides `-D PKG_USER-NETCDF=yes`.

This should auto-detect the NetCDF library if it is installed on your system at standard locations. Several advanced CMake NETCDF options exist if you need to specify where it was installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

**Traditional make**

The `lib/netcdf/Makefile.lammps` file has settings for NetCDF include and library files which LAMMPS needs to build with this package. If the settings are not valid for your system, you will need to edit the `Makefile.lammps` file. See `lib/netcdf/README` for details.

3.7.22 USER-OMP package

**CMake build**

No additional settings are required besides `-D PKG_USER-OMP=yes`. If CMake detects OpenMP compiler support, the USER-OMP code will be compiled with multi-threading support enabled, otherwise as optimized serial code.

**Traditional make**

To enable multi-threading support in the USER-OMP package (and other styles supporting OpenMP) the following compile and link flags must be added to your `Makefile.machine` file. See `src/MAKE/OPTIONS/Makefile.omp` for an example.

```
CCFLAGS: -fopenmp    # for GNU and Clang Compilers
CCFLAGS: -qopenmp -restrict  # for Intel compilers on Linux
LINKFLAGS: -fopenmp  # for GNU and Clang Compilers
LINKFLAGS: -qopenmp  # for Intel compilers on Linux
```

For other platforms and compilers, please consult the documentation about OpenMP support for your compiler.

3.7. Packages with extra build options
3.7.23 USER-QMMM package

For using LAMMPS to do QM/MM simulations via the USER-QMMM package you need to build LAMMPS as a library. A LAMMPS executable with fix qmmm included can be built, but will not be able to do a QM/MM simulation on as such. You must also build a QM code - currently only Quantum ESPRESSO (QE) is supported - and create a new executable which links LAMMPS and the QM code together. Details are given in the lib/qmmm/README file. It is also recommended to read the instructions for linking with LAMMPS as a library for background information. This requires compatible Quantum Espresso and LAMMPS versions. The current interface and makefiles have last been verified to work in February 2020 with Quantum Espresso versions 6.3 to 6.5.

CMake build

When using CMake, building a LAMMPS library is required and it is recommended to build a shared library, since any libraries built from the sources in the lib folder (including the essential libqmmm.a) are not included in the static LAMMPS library and (currently) not installed, while their code is included in the shared LAMMPS library. Thus a typical command line to configure building LAMMPS for USER-QMMM would be:

```
cmake -C .. ./cmake/presets/minimal.cmake -D PKG_USER-QMMM=yes \ 
-D BUILD_LIB=yes -DBUILD_SHARED_LIBS=yes ../cmake
```

After completing the LAMMPS build and also configuring and compiling Quantum ESPRESSO with external library support (via “make couple”), go back to the lib/qmmm folder and follow the instructions on the README file to build the combined LAMMPS/QE QM/MM executable (pwqmmm.x) in the lib/qmmm folder.

Traditional make

Before building LAMMPS, you must build the QMMM library in lib/qmmm. You can do this manually if you prefer; follow the first two steps explained in lib/qmmm/README. You can also do it in one step from the lammps/src dir, using a command like these, which simply invoke the lib/qmmm/Install.py script with the specified args:

```
$ make lib-qmmm
$ make lib-qmmm args="-m serial" # build with GNU Fortran compiler
       # (settings as in "make serial")
$ make lib-qmmm args="-m mpi" # build with default MPI compiler
       # (settings as in "make mpi")
$ make lib-qmmm args="-m gfortran" # build with GNU Fortran compiler
```

The build should produce two files: lib/qmmm/libqmmm.a and lib/qmmm/Makefile.lammps. The latter is copied from an existing Makefile.lammps.* and has settings needed to build LAMMPS with the QMMM library (though typically the settings are just blank). If necessary, you can edit/create a new lib/qmmm/Makefile.<machine> file for your system, which should define an EXTRAMAKE variable to specify a corresponding Makefile.lammps.<machine> file.

You can then install QMMM package and build LAMMPS in the usual manner. After completing the LAMMPS build and compiling Quantum ESPRESSO with external library support (via “make couple”), go back to the lib/qmmm folder and follow the instructions in the README file to build the combined LAMMPS/QE QM/MM executable (pwqmmm.x) in the lib/qmmm folder.
3.7.24 USER-QUIP package

To build with this package, you must download and build the QUIP library. It can be obtained from GitHub. For support of GAP potentials, additional files with specific licensing conditions need to be downloaded and configured. See step 1 and step 1.1 in the lib/quip/README file for details on how to do this.

CMake build

```bash
-D QUIP_LIBRARY=path  # path to libquip.a (only needed if a custom location)
```

CMake will not download and build the QUIP library. But once you have done that, a CMake build of LAMMPS with -D PKG_USER-QUIP=yes should work. Set the QUIP_LIBRARY variable if CMake cannot find the QUIP library.

Traditional make

The download/build procedure for the QUIP library, described in lib/quip/README file requires setting two environment variables, QUIP_ROOT and QUIP_ARCH. These are accessed by the lib/quip/Makefile.lammps file which is used when you compile and link LAMMPS with this package. You should only need to edit Makefile.lammps if the LAMMPS build can not use its settings to successfully build on your system.

3.7.25 USER-SCAFACOS package

To build with this package, you must download and build the ScaFaCoS Coulomb solver library

CMake build

```bash
-D DOWNLOAD_SCAFACOS=value  # download ScaFaCoS for build, value = no (default) or yes
-D SCAFACOS_LIBRARY=path  # ScaFaCos library file (only needed if at custom location)
-D SCAFACOS_INCLUDE_DIR=path  # ScaFaCoS include directory (only needed if at custom location)
```

If DOWNLOAD_SCAFACOS is set, the ScaFaCoS library will be downloaded and built inside the CMake build directory. If the ScaFaCoS library is already on your system (in a location CMake cannot find it), SCAFACOS_LIBRARY is the filename (plus path) of the ScaFaCoS library file, not the directory the library file is in. SCAFACOS_INCLUDE_DIR is the directory the ScaFaCoS include file is in.

Traditional make

You can download and build the ScaFaCoS library manually if you prefer; follow the instructions in lib/scafacos/README. You can also do it in one step from the lammps/src dir, using a command like these, which simply invoke the lib/scafacos/Install.py script with the specified args:
make lib-scafacos args="-b"   # download and build in lib/
↪scafacos/scafacos-
→<version>
make lib-scafacos args="-p $HOME/scafacos # use existing ScaFaCoS
↪installation in $HOME/scafacos

Note that 2 symbolic (soft) links, includelink and liblink, are created in lib/scafacos to point to the ScaFaCoS src dir. When LAMMPS builds in src it will use these links. You should not need to edit the lib/scafacos/Makefile.lammps file.

3.7.26 USER-SMD package

To build with this package, you must download the Eigen3 library. Eigen3 is a template library, so you do not need to build it.

**CMake build**

```
-D DOWNLOAD_EIGEN3 # download Eigen3, value = no (default) or yes
-D EIGEN3_INCLUDE_DIR=path # path to Eigen library (only needed if a
↪custom location)
```

If `DOWNLOAD_EIGEN3` is set, the Eigen3 library will be downloaded and inside the CMake build directory. If the Eigen3 library is already on your system (in a location where CMake cannot find it), set `EIGEN3_INCLUDE_DIR` to the directory the Eigen3 include file is in.

**Traditional make**

You can download the Eigen3 library manually if you prefer; follow the instructions in lib/smd/
README. You can also do it in one step from the lammps/src dir, using a command like these, which simply invoke the lib/smd/Install.py script with the specified args:

```
$ make lib-smd args="-b" # download to lib/smd/eigen3
$ make lib-smd args="-p /usr/include/eigen3" # use existing Eigen
↪installation in /usr/include/eigen3
```

Note that a symbolic (soft) link named includelink is created in lib/smd to point to the Eigen dir. When LAMMPS builds it will use this link. You should not need to edit the lib/smd/Makefile.lammps file.
3.7.27 USER-VTK package

To build with this package you must have the VTK library installed on your system.

CMake build

No additional settings are needed besides `-D PKG_USER-VTK=yes`.

This should auto-detect the VTK library if it is installed on your system at standard locations. Several advanced VTK options exist if you need to specify where it was installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

Traditional make

The `lib/vtk/Makefile.lammps` file has settings for accessing VTK files and its library, which LAMMPS needs to build with this package. If the settings are not valid for your system, check if one of the other `lib/vtk/Makefile.lammps.*` files is compatible and copy it to `Makefile.lammps`. If none of the provided files work, you will need to edit the `Makefile.lammps` file. See `lib/vtk/README` for details.

3.8 Notes for building LAMMPS on Windows

- General remarks
- Running Linux on Windows
- Using GNU GCC ported to Windows
- Using a cross-compiler

3.8.1 General remarks

LAMMPS is developed and tested primarily on Linux machines. The vast majority of HPC clusters and supercomputers today runs on Linux as well. While portability to other platforms is desired, it is not always achieved. The LAMMPS developers strongly rely on LAMMPS users giving feedback and providing assistance in resolving portability issues. This is particularly true for compiling LAMMPS on Windows, since this platform has significant differences with some low-level functionality.

3.8.2 Running Linux on Windows

So before trying to build LAMMPS on Windows, please consider if using the pre-compiled Windows binary packages are sufficient for your needs (as an aside, those packages themselves are build on a Linux machine using cross-compilers). If it is necessary for you to compile LAMMPS on a Windows machine (e.g. because it is your main desktop), please also consider using a virtual machine software and compile and run LAMMPS in a Linux virtual machine, or - if you have a recently updated Windows 10 installation - consider using the Windows subsystem for Linux. This optional Windows feature allows you to run the bash shell from Ubuntu from within Windows and from there on, you can pretty much use that shell like you are running on an Ubuntu Linux machine (e.g. installing software via apt-get and more). For more details on that, please see this tutorial.
3.8.3 Using a GNU GCC ported to Windows

One option for compiling LAMMPS on Windows natively, that has been known to work in the past is to install a bash shell, unix shell utilities, perl, GNU make, and a GNU compiler ported to Windows. The Cygwin package provides a unix/linux interface to low-level Windows functions, so LAMMPS can be compiled on Windows. The necessary (minor) modifications to LAMMPS are included, but may not always be up-to-date for recently added functionality and the corresponding new code. A machine makefile for using cygwin for the old build system is provided. Using CMake for this mode of compilation is untested and not likely to work.

When compiling for Windows do not set the -DLAMMPS_MEMALIGN define in the LMP_INC makefile variable and add -lwsock32 -lpsapi to the linker flags in LIB makefile variable. Try adding -static-libgcc or -static or both to the linker flags when your resulting LAMMPS Windows executable complains about missing .dll files. The CMake configuration should set this up automatically, but is untested.

In case of problems, you are recommended to contact somebody with experience in using cygwin. If you do come across portability problems requiring changes to the LAMMPS source code, or figure out corrections yourself, please report them on the lammps-users mailing list, or file them as an issue or pull request on the LAMMPS GitHub project.

3.8.4 Using a cross-compiler

If you need to provide custom LAMMPS binaries for Windows, but do not need to do the compilation on Windows, please consider using a Linux to Windows cross-compiler. This is how currently the Windows binary packages are created by the LAMMPS developers. Because of that, this is probably the currently best tested and supported way to build LAMMPS executables for Windows. There are makefiles provided for the traditional build system, but CMake has also been successfully tested using the mingw32-cmake and mingw64-cmake wrappers that are bundled with the cross-compiler environment on Fedora machines. A CMake preset selecting all packages compatible with this cross-compilation build is provided. The GPU package can only be compiled with OpenCL support and you need to download and install the pre-compiled OpenCL ICD loader library into your MinGW64 cross-compiler environment. With CMake this will be done transparently. To compile with MPI support, a pre-compiled library and the corresponding header files are required. There is one package for 32-bit Windows and a second package for 64-bit Windows. When building with CMake, the matching package will be downloaded automatically, but MPI support has to be explicitly enabled with -DBUILD_MPI=on.

Please keep in mind, though, that this only applies to compiling LAMMPS. Whether the resulting binaries do work correctly is not tested by the LAMMPS developers. We instead rely on the feedback of the users of these pre-compiled LAMMPS packages for Windows. We will try to resolve issues to the best of our abilities if we become aware of them. However this is subject to time constraints and focus on HPC platforms.
3.8.5 Native Visual C++ support

Support for the Visual C++ compilers is currently not available. The CMake build system is capable of creating suitable a Visual Studio style build environment, but the LAMMPS code itself is not fully ported to support Visual C++. Volunteers to take on this task are welcome.

3.9 Development build options (CMake only)

The CMake build procedure of LAMMPS offers a few extra options which are useful during development, testing or debugging.

3.9.1 Monitor compilation flags

Sometimes it is necessary to verify the complete sequence of compilation flags generated by the CMake build. To enable a more verbose output during compilation you can use the following option.

```
-D CMAKE_VERBOSE_MAKEFILE=value  # value = no (default) or yes
```

Another way of doing this without reconfiguration is calling make with variable VERBOSE set to 1:

```
make VERBOSE=1
```

3.9.2 Report missing and unneeded ‘#include’ statements

The conventions for how and when to use and order include statements in LAMMPS are documented in a separate file (also included in the source code distribution). To assist with following these conventions one can use the Include What You Use tool. This is still under development and for large and complex projects like LAMMPS there are some false positives, so suggested changes need to be verified manually. It is recommended to use at least version 0.14, which has much fewer incorrect reports than earlier versions.

The necessary steps to generate the report can be enabled via a CMake variable:

```
-D ENABLE_IWYU=value  # value = no (default) or yes
```

This will check if the required binary (include-what-you-use or iwyu) and python script script (iwyu-tool or iwyu_tool or iwyu_tool.py) can be found in the path. The analysis can then be started with:

```
make iwyu
```

This may first run some compilation, as the analysis is dependent on recording all commands required to do the compilation.
3.9.3 Address, Undefined Behavior, and Thread Sanitizer Support

Compilers such as GCC and Clang support generating instrumented binaries which use different sanitizer libraries to detect problems in the code during run-time. They can detect issues like:

- memory leaks
- undefined behavior
- data races

Please note that this kind of instrumentation usually comes with a performance hit (but much less than using tools like Valgrind with a more low level approach). To enable these features, additional compiler flags need to be added to the compilation and linking stages. This is done through setting the `ENABLE_SANITIZER` variable during configuration.

Examples:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-D ENABLE_SANITIZER=none</code></td>
<td># no sanitizer active (default)</td>
</tr>
<tr>
<td><code>-D ENABLE_SANITIZER=address</code></td>
<td># enable address sanitizer / memory leak checker</td>
</tr>
<tr>
<td><code>-D ENABLE_SANITIZER=leak</code></td>
<td># enable memory leak checker (only)</td>
</tr>
<tr>
<td><code>-D ENABLE_SANITIZER=undefined</code></td>
<td># enable undefined behavior sanitizer</td>
</tr>
<tr>
<td><code>-D ENABLE_SANITIZER=thread</code></td>
<td># enable thread sanitizer</td>
</tr>
</tbody>
</table>

3.9.4 Code Coverage and Unit Testing

The LAMMPS code is subject to multiple levels of automated testing during development: integration testing (i.e. whether the code compiles on various platforms and with a variety of settings), unit testing (i.e. whether certain individual parts of the code produce the expected results for given inputs), run testing (whether selected complete input decks run without crashing for multiple configurations), and regression testing (i.e. whether selected input examples reproduce the same results over a given number of steps and operations within a given error margin). The status of this automated testing can be viewed on https://ci.lammps.org.

The unit testing facility is integrated into the CMake build process of the LAMMPS source code distribution itself. It can be enabled by setting `-D ENABLE_TESTING=on` during the CMake configuration step. It requires the PyYAML library and development headers to compile and will download and compile a recent version of the Googletest C++ test framework for implementing the tests.

After compilation is complete, the unit testing is started in the build folder using the `ctest` command, which is part of the CMake software. The output of this command will be looking something like this:

```plaintext
[...]
$ ctest
Test project /home/akohlmey/compile/lammps/build-testing
  Start 1: MolPairStyle:hybrid-overlay
1/109 Test #1: MolPairStyle:hybrid-overlay ............ Passed 0.02 sec
  Start 2: MolPairStyle:hybrid
2/109 Test #2: MolPairStyle:hybrid ...................... Passed 0.01 sec
  Start 3: MolPairStyle:ij_class2
[...]
  Start 107: PotentialFileReader
107/109 Test #107: PotentialFileReader ................. Passed 0.04 sec
  Start 108: EIMPotentialFileReader
108/109 Test #108: EIMPotentialFileReader .............. Passed 0.03 sec
  Start 109: TestSimpleCommands
109/109 Test #109: TestSimpleCommands .................. Passed 0.02 sec
100% tests passed, 0 tests failed out of 26
(continues on next page)
```
The `ctest` command has many options, the most important ones are:

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-V</code></td>
<td>verbose output: display output of individual test runs</td>
</tr>
<tr>
<td><code>-j &lt;num&gt;</code></td>
<td>parallel run: run <code>&lt;num&gt;</code> tests in parallel</td>
</tr>
<tr>
<td><code>-R &lt;regex&gt;</code></td>
<td>run subset of tests matching the regular expression <code>&lt;regex&gt;</code></td>
</tr>
<tr>
<td><code>-E &lt;regex&gt;</code></td>
<td>exclude subset of tests matching the regular expression <code>&lt;regex&gt;</code></td>
</tr>
<tr>
<td><code>-N</code></td>
<td>dry-run: display list of tests without running them</td>
</tr>
<tr>
<td><code>-I memcheck</code></td>
<td>run tests with valgrind memory checker (if available)</td>
</tr>
</tbody>
</table>

In its full implementation, the unit test framework will consist of multiple kinds of tests implemented in different programming languages (C++, C, Python, Fortran) and testing different aspects of the LAMMPS software and its features. At the moment only tests for “force styles” are implemented. More on those in the next section.

**Note:** The unit test framework is new and still under development. The coverage is only minimal and will be expanded over time. Tests styles of the same kind of style (e.g. pair styles or bond styles) are performed with the same executable using different input files in YAML format. So to add a test for another pair style can be done by copying the YAML file and editing the style settings and then running the individual test program with a flag to update the computed reference data. Detailed documentation about how to add new test program and the contents of the YAML files for existing test programs will be provided in time as well.

## Unit tests for force styles

A large part of LAMMPS are different “styles” for computing non-bonded and bonded interactions selected through the `pair_style command`, `bond_style command`, `angle_style command`, `dihedral_style command`, `improper_style command`, and `kspace_style command`. Since these all share common interfaces, it is possible to write generic test programs that will call those common interfaces for small test systems with less than 100 atoms and compare the results with pre-recorded reference results. A test run is then a a collection multiple individual test runs each with many comparisons to reference results based on template input files, individual command settings, relative error margins, and reference data stored in a YAML format file with `.yaml` suffix. Currently the programs `test_pair_style`, `test_bond_style`, and `test_angle_style` are implemented. They will compare forces, energies and (global) stress for all atoms after a run 0 calculation and after a few steps of MD with `fix nve`, each in multiple variants with different settings and also for multiple accelerated styles. If a prerequisite style or package is missing, the individual tests are skipped. All tests will be executed on a single MPI process, so using the CMake option `-D BUILD_MPI=off` can significantly speed up testing, since this will skip the MPI initialization for each test run. Below is an example command and output:

```
[tests]$ test_pair_style mol-pair-lj_cut.yaml
[==========] Running 6 tests from 1 test suite.
[----------] Global test environment set-up.
[----------] 6 tests from PairStyle
[ RUN ] PairStyle.plain
[  OK  ] PairStyle.plain (24 ms)
[ RUN ] PairStyle.omp
[  OK  ] PairStyle.omp (18 ms)
[ RUN ] PairStyle.intel
[  OK  ] PairStyle.intel (6 ms)
```
In this particular case, 5 out of 6 sets of tests were conducted, the tests for the \texttt{lj/cut/opt} pair style was skipped, since the tests executable did not include it. To learn what individual tests are performed, you (currently) need to read the source code. You can use code coverage recording (see next section) to confirm how well the tests cover the code paths in the individual source files.

The force style test programs have a common set of options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-g &lt;newfile&gt;</td>
<td>regenerate reference data in new YAML file</td>
</tr>
<tr>
<td>-u</td>
<td>update reference data in the original YAML file</td>
</tr>
<tr>
<td>-s</td>
<td>print error statistics for each group of comparisons</td>
</tr>
<tr>
<td>-v</td>
<td>verbose output: also print the executed LAMMPS commands</td>
</tr>
</tbody>
</table>

The \texttt{ctest} tool has no mechanism to directly pass flags to the individual test programs, but a workaround has been implemented where these flags can be set in an environment variable \texttt{TEST_ARGS}. Example:

```
env TEST_ARGS=-s ctest -V -R BondStyle
```

To add a test for a style that is not yet covered, it is usually best to copy a YAML file for a similar style to a new file, edit the details of the style (how to call it, how to set its coefficients) and then run test command with either the \texttt{-g} and the replace the initial test file with the regenerated one or the \texttt{-u} option. The \texttt{-u} option will destroy the original file, if the generation run does not complete, so using \texttt{-g} is recommended unless the YAML file is fully tested and working.

**Recommendations and notes for YAML files**

- The reference results should be recorded without any code optimization or related compiler flags enabled.

- The \texttt{epsilon} parameter defines the relative precision with which the reference results must be met. The test geometries often have high and low energy parts and thus a significant impact from floating-point math truncation errors is to be expected. Some functional forms and potentials are more noisy than others, so this parameter needs to be adjusted. Typically a value around 1.0e-13 can be used, but it may need to be as large as 1.0e-8 in some cases.

- The tests for pair styles from \texttt{OPT}, \texttt{USER-OMP} and \texttt{USER-INTEL} are performed with automatically rescaled epsilon to account for additional loss of precision from code optimizations and different summation orders.

- When compiling with (aggressive) compiler optimization, some tests are likely to fail. It is recommended to inspect the individual tests in detail to decide, whether the specific error for a specific property is acceptable (it often is), or this may be an indication of mis-compiled code (or an undesired large loss of precision due to significant reordering of operations and thus less error cancellation).
Unit tests for timestepping related fixes

A substantial subset of fix styles are invoked regularly during MD timestepping and manipulate per-atom properties like positions, velocities, and forces. For those fix styles, testing can be done in a very similar fashion as for force fields and thus there is a test program test_fix_timestep that shares a lot of code, properties, and command line flags with the force field style testers described in the previous section.

This tester will set up a small molecular system run with verlet run style for 4 MD steps, then write a binary restart and continue for another 4 MD steps. At this point coordinates and velocities are recorded and compared to reference data. Then the system is cleared, restarted and running the second 4 MD steps again and the data is compared to the same reference. That is followed by another restart after which per atom type masses are replaced with per-atom masses and the second 4 MD steps are repeated again and compared to the same reference. Also global scalar and vector data of the fix is recorded and compared. If the fix is a thermostat and thus the internal property $t_{\text{target}}$ can be extracted, then this is compared to the reference data. The tests are repeated with the respa run style.

If the fix has a multi-threaded version in the USER-OMP package, then the entire set of tests is repeated for that version as well.

For this to work, some additional conditions have to be met by the YAML format test inputs.

- The fix to be tested (and only this fix), should be listed in the prerequisites: section
- The fix to be tested must be specified in the post_commands: section with the fix-ID test. This section may contain other commands and other fixes (e.g. an instance of fix nve for testing a thermostat or force manipulation fix)
- For fixes that can tally contributions to the global virial, the line fix_modify test virial yes should be included in the post_commands: section of the test input.
- For thermostat fixes the target temperature should be ramped from an arbitrary value (e.g. 50K) to a pre-defined target temperature entered as ${t_{\text{target}}}$.
- For fixes that have thermostating support included, but do not have it enabled in the input (e.g. fix rigid with default settings), the post_commands: section should contain the line variable t_target delete to disable the target temperature ramp check to avoid false positives.

Use custom linker for faster link times when ENABLE TESTING is active

When compiling LAMMPS with enabled tests, most test executables will need to be linked against the LAMMPS library. Since this can be a very large library with many C++ objects when many packages are enabled, link times can become very long on machines that use the GNU BFD linker (e.g. Linux systems). Alternatives like the lld linker of the LLVM project or the gold linker available with GNU binutils can speed up this step substantially. CMake will by default test if any of the two can be enabled and use it when ENABLE TESTING is active. It can also be selected manually through the CMAKE CUSTOM LINKER CMake variable. Allowed values are lld, gold, bfd, or default. The default option will use the system default linker otherwise, the linker is chosen explicitly. This option is only available for the GNU or Clang C++ compiler.
Tests for other components and utility functions

Additional tests that validate utility functions or specific components of LAMMPS are implemented as standalone executable which may, or may not require creating a suitable LAMMPS instance. These tests are more specific and do not require YAML format input files. To add a test, either an existing source file needs to be extended or a new file added, which in turn requires additions to the CMakeLists.txt file in the source folder.

Collect and visualize code coverage metrics

You can also collect code coverage metrics while running LAMMPS or the tests by enabling code coverage support during the CMake configuration:

```
-D ENABLE_COVERAGE=on  # enable coverage measurements (off by default)
```

This will instrument all object files to write information about which lines of code were accessed during execution in files next to the corresponding object files. These can be post-processed to visually show the degree of coverage and which code paths are accessed and which are not taken. When working on unit tests (see above), this can be extremely helpful to determine which parts of the code are not executed and thus what kind of tests are still missing. The coverage data is cumulative, i.e. new data is added with each new run.

Enabling code coverage will also add the following build targets to generate coverage reports after running the LAMMPS executable or the unit tests:

```
make gen_coverage_html  # generate coverage report in HTML format
make gen_coverage_xml  # generate coverage report in XML format
make clean_coverage_html  # delete folder with HTML format coverage report
make reset_coverage    # delete all collected coverage data and HTML output
```

These reports require GCOVR to be installed. The easiest way to do this to install it via pip:

```
pip install git+https://github.com/gcovr/gcovr.git
```

After post-processing with gen_coverage_html the results are in a folder coverage_html and can be viewed with a web browser. The images below illustrate how the data is presented.
3.9.5 Coding style utilities

To aid with enforcing some of the coding style conventions in LAMMPS some additional build targets have been added. These require Python 3.5 or later and will only work on Unix-like operating and file systems. The following options are available.

<table>
<thead>
<tr>
<th>Target</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>make check-whitespace</td>
<td># generate coverage report in HTML format</td>
</tr>
<tr>
<td>make fix-whitespace</td>
<td># generate coverage report in XML format</td>
</tr>
<tr>
<td>make check-permissions</td>
<td># delete folder with HTML format coverage report</td>
</tr>
<tr>
<td>make fix-permissions</td>
<td># delete all collected coverage data and HTML output</td>
</tr>
</tbody>
</table>

For the code in the `unittest` tree we are using the `clang-format` tool (Clang version 8.0 or later is required). If available, the source code files in the `unittest` tree can be updated to conform to the formatting settings using `make format-tests`. 
These pages explain how to run LAMMPS once you have **installed an executable** or **downloaded the source code** and **built an executable**. The **Commands** doc page describes how input scripts are structured and the commands they can contain.

### 4.1 Basics of running LAMMPS

LAMMPS is run from the command line, reading commands from a file via the `-in` command line flag, or from standard input. Using the “-in in.file” variant is recommended:

```bash
$ lmp_serial -in in.file
$ lmp_serial < in.file
$ /path/to/lammps/src/lmp_serial -i in.file
$ mpirun -np 4 lmp_mpi -in in.file
$ mpirun -np 8 /path/to/lammps/src/lmp_mpi -in in.file
$ mpirun -np 6 /usr/local/bin/lmp -in in.file
```

You normally run the LAMMPS command in the directory where your input script is located. That is also where output files are produced by default, unless you provide specific other paths in your input script or on the command line. As in some of the examples above, the LAMMPS executable itself can be placed elsewhere.

**Note:** The redirection operator “<” will not always work when running in parallel with mpirun; for those systems the -in form is required.

As LAMMPS runs it prints info to the screen and a logfile named `log.lammps`. More info about output is given on the **screen and logfile output** page.

If LAMMPS encounters errors in the input script or while running a simulation it will print an ERROR message and stop or a WARNING message and continue. See the **Common Problems** page for a discussion of the various kinds of errors LAMMPS can or can’t detect, a list of all ERROR and WARNING messages, and what to do about them.

LAMMPS can run the same problem on any number of processors, including a single processor. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off due to using floating-point math can cause slight differences and an eventual divergence of molecular dynamics trajectories. See the **Errors common** doc page for discussion of this.

LAMMPS can run as large a problem as will fit in the physical memory of one or more processors. If you run out of memory, you must run on more processors or define a smaller problem. The amount of memory needed and how well it can be distributed across processors may vary based on the models and settings and commands used.
If you run LAMMPS in parallel via `mpirun`, you should be aware of the `processors` command, which controls how MPI tasks are mapped to the simulation box, as well as `mpirun` options that control how MPI tasks are assigned to physical cores of the node(s) of the machine you are running on. These settings can improve performance, though the defaults are often adequate.

For example, it is often important to bind MPI tasks (processes) to physical cores (processor affinity), so that the operating system does not migrate them during a simulation. If this is not the default behavior on your machine, the `mpirun` option “--bind-to core” (OpenMPI) or “-bind-to core” (MPICH) can be used.

If the LAMMPS command(s) you are using support multi-threading, you can set the number of threads per MPI task via the environment variable `OMP_NUM_THREADS`, before you launch LAMMPS:

```
$ export OMP_NUM_THREADS=2    # bash
$ setenv OMP_NUM_THREADS 2     # csh or tcsh
```

This can also be done via the `package` command or via the `-pk` command-line switch which invokes the package command. See the `package` command or `Speed` doc pages for more details about which accelerator packages and which commands support multi-threading.

You can experiment with running LAMMPS using any of the input scripts provided in the examples or bench directory. Input scripts are named in.* and sample outputs are named log.*.P where P is the number of processors it was run on. Some of the examples or benchmarks require LAMMPS to be built with optional packages.

### 4.2 Command-line options

At run time, LAMMPS recognizes several optional command-line switches which may be used in any order. Either the full word or a one-or-two letter abbreviation can be used:

- `-e` or `-echo`
- `-h` or `-help`
- `-i` or `-in`
- `-k` or `-kokkos`
- `-l` or `-log`
- `-m` or `-mpicolor`
- `-nc` or `-nocite`
- `-pk` or `-package`
- `-p` or `-partition`
- `-pl` or `-plog`
- `-ps` or `-pscreen`
- `-ro` or `-reorder`
- `-r2data` or `-restart2data`
- `-r2dump` or `-restart2dump`
- `-sc` or `-screen`
- `-sf` or `-suffix`
- `-v` or `-var`
For example, the lmp_mpi executable might be launched as follows:

```
$ mpirun -np 16 lmp_mpi -v f tmp.out -l my.log -sc none -i in.alloy
$ mpirun -np 16 lmp_mpi -var f tmp.out -log my.log -screen none -in in.alloy
```

-echo style

Set the style of command echoing. The style can be none or screen or log or both. Depending on the style, each command read from the input script will be echoed to the screen and/or logfile. This can be useful to figure out which line of your script is causing an input error. The default value is log. The echo style can also be set by using the `echo` command in the input script itself.

-help

Print a brief help summary and a list of options compiled into this executable for each LAMMPS style (atom_style, fix, compute, pair_style, bond_style, etc). This can tell you if the command you want to use was included via the appropriate package at compile time. LAMMPS will print the info and immediately exit if this switch is used.

-in file

Specify a file to use as an input script. This is an optional switch when running LAMMPS in one-partition mode. If it is not specified, LAMMPS reads its script from standard input, typically from a script via i/o redirection; e.g. lmp_linux < in.run. I/O redirection should also work in parallel, but if it does not (in the unlikely case that an MPI implementation does not support it), then use the -in flag. Note that this is a required switch when running LAMMPS in multi-partition mode, since multiple processors cannot all read from stdin.

-kokkos on/off keyword/value . . .

Explicitly enable or disable KOKKOS support, as provided by the KOKKOS package. Even if LAMMPS is built with this package, as described in the the KOKKOS package page, this switch must be set to enable running with KOKKOS-enabled styles the package provides. If the switch is not set (the default), LAMMPS will operate as if the KOKKOS package were not installed; i.e. you can run standard LAMMPS or with the GPU or USER-OMP packages, for testing or benchmarking purposes.

Additional optional keyword/value pairs can be specified which determine how Kokkos will use the underlying hardware on your platform. These settings apply to each MPI task you launch via the “mpirun” or “mpiexec” command. You may choose to run one or more MPI tasks per physical node. Note that if you are running on a desktop machine, you typically have one physical node. On a cluster or supercomputer there may be dozens or 1000s of physical nodes.

Either the full word or an abbreviation can be used for the keywords. Note that the keywords do not use a leading minus sign. I.e. the keyword is “t”, not “-t”. Also note that each of the keywords has a default setting. Examples of when to use these options and what settings to use on different platforms is given on the KOKKOS package doc page.

- d or device
- g or gpus
- t or threads
- n or numa

```
device Nd
```

4.2. Command-line options
This option is only relevant if you built LAMMPS with CUDA=yes, you have more than one GPU per node, and if you are running with only one MPI task per node. The Nd setting is the ID of the GPU on the node to run on. By default Nd = 0. If you have multiple GPUs per node, they have consecutive IDs numbered as 0,1,2, etc. This setting allows you to launch multiple independent jobs on the node, each with a single MPI task per node, and assign each job to run on a different GPU.

\[ \text{gpus Nd Ng Ns} \]

This option is only relevant if you built LAMMPS with CUDA=yes, you have more than one GPU per node, and you are running with multiple MPI tasks per node (up to one per GPU). The Ng setting is how many GPUs you will use. The Ns setting is optional. If set, it is the ID of a GPU to skip when assigning MPI tasks to GPUs. This may be useful if your desktop system reserves one GPU to drive the screen and the rest are intended for computational work like running LAMMPS. By default Ng = 1 and Ns is not set.

Depending on which flavor of MPI you are running, LAMMPS will look for one of these 4 environment variables

- SLURM_LOCALID (various MPI variants compiled with SLURM support)
- MPT_LRANK (HPE MPI)
- MV2_COMM_WORLD_LOCAL_RANK (Mvapich)
- OMPI_COMM_WORLD_LOCAL_RANK (OpenMPI)

which are initialized by the “srun”, “mpirun” or “mpiexec” commands. The environment variable setting for each MPI rank is used to assign a unique GPU ID to the MPI task.

\[ \text{threads Nt} \]

This option assigns Nt number of threads to each MPI task for performing work when Kokkos is executing in OpenMP or pthreads mode. The default is Nt = 1, which essentially runs in MPI-only mode. If there are Np MPI tasks per physical node, you generally want Np*Nt = the number of physical cores per node, to use your available hardware optimally. This also sets the number of threads used by the host when LAMMPS is compiled with CUDA=yes.

\[ \text{numa Nm} \]

This option is only relevant when using pthreads with hwloc support. In this case Nm defines the number of NUMA regions (typically sockets) on a node which will be utilized by a single MPI rank. By default Nm = 1. If this option is used the total number of worker-threads per MPI rank is threads*numa. Currently it is always almost better to assign at least one MPI rank per NUMA region, and leave numa set to its default value of 1. This is because letting a single process span multiple NUMA regions induces a significant amount of cross NUMA data traffic which is slow.

-log file

Specify a log file for LAMMPS to write status information to. In one-partition mode, if the switch is not used, LAMMPS writes to the file log.lammps. If this switch is used, LAMMPS writes to the specified file. In multi-partition mode, if the switch is not used, a log.lammps file is created with high-level status information. Each partition also writes to a log.lammps,N file where N is the partition ID. If the switch is specified in multi-partition mode, the high-level logfile is named “file” and each partition also logs information to a file.N. For both one-partition and multi-partition mode, if the specified file is “none”, then no log files are created. Using a log command in the input script will override this setting. Option -plog will override the name of the partition log files file.N.

-mpicolor color

If used, this must be the first command-line argument after the LAMMPS executable name. It is only used when LAMMPS is launched by an mpirun command which also launches another executable(s) at the same time. (The other executable could be LAMMPS as well.) The color is an integer value which should be different for each executable (another application may set this value in a different way). LAMMPS and the other executable(s) perform
an MPI_Comm_split() with their own colors to shrink the MPI_COMM_WORLD communication to be the subset of processors they are actually running on.

Currently, this is only used in LAMMPS to perform client/server messaging with another application. LAMMPS can act as either a client or server (or both). More details are given on the *Howto client/server* doc page.

Specifically, this refers to the “mpi/one” mode of messaging provided by the *message* command and the CSlib library LAMMPS links with from the lib/message directory. See the *message* command for more details.

---

**-nocite**

Disable writing the log.cite file which is normally written to list references for specific cite-able features used during a LAMMPS run. See the *citation* page for more details.

---

**-package style args . . . .**

Invoke the *package* command with style and args. The syntax is the same as if the command appeared at the top of the input script. For example “-package gpu 2” or “-pk gpu 2” is the same as *package gpu 2* in the input script. The possible styles and args are documented on the *package* doc page. This switch can be used multiple times, e.g. to set options for the USER-INTEL and USER-OMP packages which can be used together.

Along with the “-suffix” command-line switch, this is a convenient mechanism for invoking accelerator packages and their options without having to edit an input script.

---

**-partition 8x2 4 5 . . .**

Invoke LAMMPS in multi-partition mode. When LAMMPS is run on P processors and this switch is not used, LAMMPS runs in one partition, i.e. all P processors run a single simulation. If this switch is used, the P processors are split into separate partitions and each partition runs its own simulation. The arguments to the switch specify the number of processors in each partition. Arguments of the form MxN mean M partitions, each with N processors. Arguments of the form N mean a single partition with N processors. The sum of processors in all partitions must equal P. Thus the command “-partition 8x2 4 5” has 10 partitions and runs on a total of 25 processors.

Running with multiple partitions can be useful for running *multi-replica simulations*, where each replica runs on one or a few processors. Note that with MPI installed on a machine (e.g. your desktop), you can run on more (virtual) processors than you have physical processors.

To run multiple independent simulations from one input script, using multiple partitions, see the *Howto multiple* page. World- and universe-style *variables* are useful in this context.

---

**-plog file**

Specify the base name for the partition log files, so partition N writes log information to file.N. If file is none, then no partition log files are created. This overrides the filename specified in the -log command-line option. This option is useful when working with large numbers of partitions, allowing the partition log files to be suppressed (-plog none) or placed in a sub-directory (-plog replica_files/log.lammps) If this option is not used the log file for partition N is log.lammps.N or whatever is specified by the -log command-line option.

---

**-pscreen file**

Specify the base name for the partition screen file, so partition N writes screen information to file.N. If file is none, then no partition screen files are created. This overrides the filename specified in the -screen command-line option. This option is useful when working with large numbers of partitions, allowing the partition screen files to be suppressed.
(-pscreen none) or placed in a sub-directory (-pscreen replica_files/screen). If this option is not used the screen file for partition N is screen.N or whatever is specified by the -screen command-line option.

-reorder

This option has 2 forms:

- reorder nth N
- reorder custom filename

Reorder the processors in the MPI communicator used to instantiate LAMMPS, in one of several ways. The original MPI communicator ranks all P processors from 0 to P-1. The mapping of these ranks to physical processors is done by MPI before LAMMPS begins. It may be useful in some cases to alter the rank order. E.g. to insure that cores within each node are ranked in a desired order. Or when using the run_style verlet/split command with 2 partitions to insure that a specific Kspace processor (in the second partition) is matched up with a specific set of processors in the first partition. See the General tips page for more details.

If the keyword *nth* is used with a setting *N*, then it means every Nth processor will be moved to the end of the ranking. This is useful when using the run_style verlet/split command with 2 partitions via the -partition command-line switch. The first set of processors will be in the first partition, the second set in the second partition. The -reorder command-line switch can alter this so that the first N procs in the first partition and one proc in the second partition will be ordered consecutively, e.g. as the cores on one physical node. This can boost performance. For example, if you use “-reorder nth 4” and “-partition 9 3” and you are running on 12 processors, the processors will be reordered from

0 1 2 3 4 5 6 7 8 9 10 11

to

0 1 2 4 5 6 8 9 10 3 7 11

so that the processors in each partition will be

0 1 2 4 5 6 8 9 10
3 7 11

See the “processors” command for how to insure processors from each partition could then be grouped optimally for quad-core nodes.

If the keyword is *custom*, then a file that specifies a permutation of the processor ranks is also specified. The format of the reorder file is as follows. Any number of initial blank or comment lines (starting with a "#" character) can be present. These should be followed by P lines of the form:

I J

where P is the number of processors LAMMPS was launched with. Note that if running in multi-partition mode (see the -partition switch above) P is the total number of processors in all partitions. The I and J values describe a permutation of the P processors. Every I and J should be values from 0 to P-1 inclusive. In the set of P I values, every proc ID should appear exactly once. Ditto for the set of P J values. A single IJ pairing means that the physical processor with rank I in the original MPI communicator will have rank J in the reordered communicator.

Note that rank ordering can also be specified by many MPI implementations, either by environment variables that specify how to order physical processors, or by config files that specify what physical processors to assign to each MPI rank. The -reorder switch simply gives you a portable way to do this without relying on MPI itself. See the processors file command for how to output info on the final assignment of physical processors to the LAMMPS simulation domain.
-restart2data restartfile [remap] datafile keyword value ...

Convert the restart file into a data file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart  restartfile [remap]
write_data   datafile keyword value ...
```

The specified restartfile and/or datafile name may contain the wild-card character “*”. The restartfile name may also contain the wild-card character “%”. The meaning of these characters is explained on the `read_restart` and `write_data` doc pages. The use of “%” means that a parallel restart file can be read. Note that a filename such as file.* may need to be enclosed in quotes or the “*” character prefixed with a backslash (“\”) to avoid shell expansion of the “*” character.

Following restartfile argument, the optional word “remap” may be used. This has the same effect like adding it to a `read_restart` command, and operates as explained on its doc page. This is useful if reading the restart file triggers an error that atoms have been lost. In that case, use of the remap flag should allow the data file to still be produced.

The syntax following restartfile (or remap), namely

```
datafile keyword value ...
```

is identical to the arguments of the `write_data` command. See its doc page for details. This includes its optional keyword/value settings.

-restart2dump restartfile [remap] group-ID dumpstyle dumpfile arg1 arg2 ...

Convert the restart file into a dump file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart  restartfile [remap]
write_dump   group-ID dumpstyle dumpfile arg1 arg2 ...
```

Note that the specified restartfile and dumpfile names may contain wild-card characters (“*”,“%”) as explained on the `read_restart` and `write_dump` doc pages. The use of “%” means that a parallel restart file and/or parallel dump file can be read and/or written. Note that a filename such as file.* may need to be enclosed in quotes or the “*” character prefixed with a backslash (“\”) to avoid shell expansion of the “*” character.

Note that following the restartfile argument, the optional word “remap” can be used. This has the effect as adding it to the `read_restart` command, as explained on its doc page. This is useful if reading the restart file triggers an error that atoms have been lost. In that case, use of the remap flag should allow the dump file to still be produced.

The syntax following restartfile (or remap), namely

```
group-ID dumpstyle dumpfile arg1 arg2 ...
```

is identical to the arguments of the `write_dump` command. See its doc page for details. This includes what per-atom fields are written to the dump file and optional `dump_modify` settings, including ones that affect how parallel dump files are written, e.g. the `nfile` and `fileper` keywords. See the `dump_modify` doc page for details.

-screen file

Specify a file for LAMMPS to write its screen information to. In one-partition mode, if the switch is not used, LAMMPS writes to the screen. If this switch is used, LAMMPS writes to the specified file instead and you will see no screen output. In multi-partition mode, if the switch is not used, high-level status information is written to the screen. Each partition also writes to a screen.N file where N is the partition ID. If the switch is specified in multi-partition mode, the high-level screen dump is named “file” and each partition also writes screen information to a file.N.
both one-partition and multi-partition mode, if the specified file is "none", then no screen output is performed. Option
-pscreen will override the name of the partition screen files file.N.

-suffix style args

Use variants of various styles if they exist. The specified style can be gpu, intel, kk, omp, opt, or hybrid. These
refer to optional packages that LAMMPS can be built with, as described in Accelerate performance. The “gpu” style
corresponds to the GPU package, the “intel” style to the USER-INTEL package, the “kk” style to the KOKKOS
package, the “opt” style to the OPT package, and the “omp” style to the USER-OMP package. The hybrid style is the
only style that accepts arguments. It allows for two packages to be specified. The first package specified is the default
and will be used if it is available. If no style is available for the first package, the style for the second package will be
used if available. For example, “-suffix hybrid intel omp” will use styles from the USER-INTEL package if they are
installed and available, but styles for the USER-OMP package otherwise.

Along with the “-package” command-line switch, this is a convenient mechanism for invoking accelerator packages
and their options without having to edit an input script.

As an example, all of the packages provide a pair_style lj/cut variant, with style names lj/cut/gpu, lj/cut/intel, lj/cut/kk,
lj/cut/omp, and lj/cut/opt. A variant style can be specified explicitly in your input script, e.g. pair_style lj/cut/gpu. If
the -suffix switch is used the specified suffix (gpu,intel,kk,omp,opt) is automatically appended whenever your input
script command creates a new atom style, pair style, fix, compute, or run style. If the variant version does not exist, the
standard version is created.

For the GPU package, using this command-line switch also invokes the default GPU settings, as if the command
“package gpu 1” were used at the top of your input script. These settings can be changed by using the “-package gpu”
command-line switch or the package gpu command in your script.

For the USER-INTEL package, using this command-line switch also invokes the default USER-INTEL settings, as if
the command “package intel 1” were used at the top of your input script. These settings can be changed by using the
“-package intel” command-line switch or the package intel command in your script. If the USER-OMP package is
also installed, the hybrid style with “intel omp” arguments can be used to make the omp suffix a second choice, if a
requested style is not available in the USER-INTEL package. It will also invoke the default USER-OMP settings, as
if the command “package omp 0” were used at the top of your input script. These settings can be changed by using
the “-package omp” command-line switch or the package omp command in your script.

For the KOKKOS package, using this command-line switch also invokes the default KOKKOS settings, as if the
command “package kokkos” were used at the top of your input script. These settings can be changed by using the
“-package kokkos” command-line switch or the package kokkos command in your script.

For the OMP package, using this command-line switch also invokes the default OMP settings, as if the command
“package omp 0” were used at the top of your input script. These settings can be changed by using the “-package
omp” command-line switch or the package omp command in your script.

The suffix command can also be used within an input script to set a suffix, or to turn off or back on any suffix setting
made via the command line.

-var name value1 value2 . . .

Specify a variable that will be defined for substitution purposes when the input script is read. This switch can be used
multiple times to define multiple variables. “Name” is the variable name which can be a single character (referenced
as $x in the input script) or a full string (referenced as ${abc}). An index-style variable will be created and populated
with the subsequent values, e.g. a set of filenames. Using this command-line option is equivalent to putting the
line “variable name index value1 value2 . . .” at the beginning of the input script. Defining an index variable as a
command-line argument overrides any setting for the same index variable in the input script, since index variables
cannot be re-defined.
See the `variable` command for more info on defining index and other kinds of variables and the `Parsing rules` page for more info on using variables in input scripts.

**Note:** Currently, the command-line parser looks for arguments that start with `--` to indicate new switches. Thus you cannot specify multiple variable values if any of them start with a `--`, e.g. a negative numeric value. It is OK if the first value starts with a `-`, since it is automatically skipped.

### 4.3 Screen and logfile output

As LAMMPS reads an input script, it prints information to both the screen and a log file about significant actions it takes to setup a simulation. When the simulation is ready to begin, LAMMPS performs various initializations, and prints info about the run it is about to perform, including the amount of memory (in MBytes per processor) that the simulation requires. It also prints details of the initial thermodynamic state of the system. During the run itself, thermodynamic information is printed periodically, every few timesteps. When the run concludes, LAMMPS prints the final thermodynamic state and a total run time for the simulation. It also appends statistics about the CPU time and storage requirements for the simulation. An example set of statistics is shown here:

Loop time of 2.81192 on 4 proc for 300 steps with 2004 atoms

Performance: 18.436 ns/day 1.302 hours/ns 106.689 timesteps/s

97.0% CPU use with 4 MPI tasks x no OpenMP threads

Total # of neighbors = 708028
Ave neighs/atom = 353.307
Ave special neighs/atom = 2.34032
Neighbor list builds = 26
Dangerous builds = 0

The first section provides a global loop timing summary. The `loop time` is the total wall-clock time for the simulation to run. The `Performance` line is provided for convenience to help predict how long it will take to run a desired physical simulation. The `CPU use` line provides the CPU utilization per MPI task; it should be close to 100% times the number
of OpenMP threads (or 1 of not using OpenMP). Lower numbers correspond to delays due to file I/O or insufficient thread utilization.

The MPI task section gives the breakdown of the CPU run time (in seconds) into major categories:

- **Pair** = non-bonded force computations
- **Bond** = bonded interactions: bonds, angles, dihedrals, impropers
- **Kspace** = long-range interactions: Ewald, PPPM, MSM
- **Neigh** = neighbor list construction
- **Comm** = inter-processor communication of atoms and their properties
- **Output** = output of thermodynamic info and dump files
- **Modify** = fixes and computes invoked by fixes
- **Other** = all the remaining time

For each category, there is a breakdown of the least, average and most amount of wall time any processor spent on this category of computation. The “%varavg” is the percentage by which the max or min varies from the average. This is an indication of load imbalance. A percentage close to 0 is perfect load balance. A large percentage is imbalance. The final “%total” column is the percentage of the total loop time is spent in this category.

When using the timer full setting, an additional column is added that also prints the CPU utilization in percent. In addition, when using timer full and the package omp command are active, a similar timing summary of time spent in threaded regions to monitor thread utilization and load balance is provided. A new Thread timings section is also added, which lists the time spent in reducing the per-thread data elements to the storage for non-threaded computation. These thread timings are measured for the first MPI rank only and thus, because the breakdown for MPI tasks can change from MPI rank to MPI rank, this breakdown can be very different for individual ranks. Here is an example output for this section:

Thread timings breakdown (MPI rank 0):

<table>
<thead>
<tr>

</tbody>
</table>

The third section above lists the number of owned atoms (Nlocal), ghost atoms (Nghost), and pair-wise neighbors stored per processor. The max and min values give the spread of these values across processors with a 10-bin histogram showing the distribution. The total number of histogram counts is equal to the number of processors.

The last section gives aggregate statistics (across all processors) for pair-wise neighbors and special neighbors that LAMMPS keeps track of (see the special_bonds command). The number of times neighbor lists were rebuilt is tallied, as is the number of potentially dangerous rebuilds. If atom movement triggered neighbor list rebuilding (see the neigh_modify command), then dangerous reneighbörings are those that were triggered on the first timestep atom movement was checked for. If this count is non-zero you may wish to reduce the delay factor to insure no force interactions are missed by atoms moving beyond the neighbor skin distance before a rebuild takes place.

If an energy minimization was performed via the minimize command, additional information is printed, e.g.
Minimization stats:
Stopping criterion = linesearch alpha is zero
Energy initial, next-to-last, final =
-6372.3765206 -8328.46998942 -8328.46998942
Force two-norm initial, final = 1059.36 5.36874
Force max component initial, final = 58.6026 1.46872
Final line search alpha, max atom move = 2.7842e-10 4.0892e-10
Iterations, force evaluations = 701 1516

The first line prints the criterion that determined minimization was converged. The next line lists the initial and final energy, as well as the energy on the next-to-last iteration. The next 2 lines give a measure of the gradient of the energy (force on all atoms). The 2-norm is the “length” of this 3N-component force vector; the largest component (x, y, or z) of force (infinity-norm) is also given. Then information is provided about the line search and statistics on how many iterations and force-evaluations the minimizer required. Multiple force evaluations are typically done at each iteration to perform a 1d line minimization in the search direction. See the minimize doc page for more details.

If a kspace_style long-range Coulombics solver that performs FFTs was used during the run (PPPM, Ewald), then additional information is printed, e.g.

FFT time (% of Kspce) = 0.200313 (8.34477)
FFT Gflps 3d 1d-only = 2.31074 9.19989

The first line is the time spent doing 3d FFTs (several per timestep) and the fraction it represents of the total KSpace time (listed above). Each 3d FFT requires computation (3 sets of 1d FFTs) and communication (transposes). The total flops performed is 5Nlog_2(N), where N is the number of points in the 3d grid. The FFTs are timed with and without the communication and a Gflop rate is computed. The 3d rate is with communication; the 1d rate is without (just the 1d FFTs). Thus you can estimate what fraction of your FFT time was spent in communication, roughly 75% in the example above.

### 4.4 Running LAMMPS on Windows

To run a serial (non-MPI) executable, follow these steps:

- Get a command prompt by going to Start->Run... , then typing “cmd”.
- Move to the directory where you have your input script, (e.g. by typing: cd “Documents”).
- At the command prompt, type “lmp_serial -in in.file”, where in.file is the name of your LAMMPS input script.

Note that the serial executable includes support for multi-threading parallelization from the styles in the USER-OMP packages. To run with 4 threads, you can type this:

```
lmp_serial -in in.lj -pk omp 4 -sf omp
```

For the MPI executable, which allows you to run LAMMPS under Windows in parallel, follow these steps.

Download and install a compatible MPI library binary package:

- for 32-bit Windows: mpich2-1.4.1p1-win-ia32.msi
- for 64-bit Windows: mpich2-1.4.1p1-win-x86-64.msi
The LAMMPS Windows installer packages will automatically adjust your path for the default location of this MPI package. After the installation of the MPICH2 software, it needs to be integrated into the system. For this you need to start a Command Prompt in Administrator Mode (right click on the icon and select it). Change into the MPICH2 installation directory, then into the sub-directory `bin` and execute `smpd.exe -install`. Exit the command window.

- Get a new, regular command prompt by going to Start->Run..., then typing “cmd”.
- Move to the directory where you have your input file (e.g. by typing: `cd “Documents”`).

Then type something like this:

```
mpiexec -localonly 4 lmp_mpi -in in.file
mpiexec -np 4 lmp_mpi -in in.file
```

where `in.file` is the name of your LAMMPS input script. For the latter case, you may be prompted to enter your password.

In this mode, output may not immediately show up on the screen, so if your input script takes a long time to execute, you may need to be patient before the output shows up.

The parallel executable can also run on a single processor by typing something like this:

```
lmp_mpi -in in.lj
```

Note that the parallel executable also includes OpenMP multi-threading, which can be combined with MPI using something like:

```
mpiexec -localonly 2 lmp_mpi -in in.lj -pk omp 2 -sf omp
```
These pages describe how a LAMMPS input script is formatted and the commands in it are used to define a LAMMPS simulation.

5.1 LAMMPS input scripts

LAMMPS executes by reading commands from a input script (text file), one line at a time. When the input script ends, LAMMPS exits. Each command causes LAMMPS to take some action. It may set an internal variable, read in a file, or run a simulation. Most commands have default settings, which means you only need to use the command if you wish to change the default.

In many cases, the ordering of commands in an input script is not important. However the following rules apply:

1) LAMMPS does not read your entire input script and then perform a simulation with all the settings. Rather, the input script is read one line at a time and each command takes effect when it is read. Thus this sequence of commands:

<table>
<thead>
<tr>
<th>timestep</th>
<th>0.5</th>
</tr>
</thead>
<tbody>
<tr>
<td>run</td>
<td>100</td>
</tr>
<tr>
<td>run</td>
<td>100</td>
</tr>
</tbody>
</table>

does something different than this sequence:

| run      | 100 |
| timestep | 0.5 |
| run      | 100 |

In the first case, the specified timestep (0.5 fs) is used for two simulations of 100 timesteps each. In the second case, the default timestep (1.0 fs) is used for the first 100 step simulation and a 0.5 fs timestep is used for the second one.

2) Some commands are only valid when they follow other commands. For example you cannot set the temperature of a group of atoms until atoms have been defined and a group command is used to define which atoms belong to the group.

3) Sometimes command B will use values that can be set by command A. This means command A must precede command B in the input script if it is to have the desired effect. For example, the read_data command initializes the system by setting up the simulation box and assigning atoms to processors. If default values are not desired, the processors and boundary commands need to be used before read_data to tell LAMMPS how to map processors to the simulation box.

Many input script errors are detected by LAMMPS and an ERROR or WARNING message is printed. The Errors doc page gives more information on what errors mean. The documentation for each command lists restrictions on how the command can be used.
5.2 Parsing rules for input scripts

Each non-blank line in the input script is treated as a command. LAMMPS commands are case sensitive. Command names are lower-case, as are specified command arguments. Upper case letters may be used in file names or user-chosen ID strings.

Here are 6 rules for how each line in the input script is parsed by LAMMPS:

1. If the last printable character on the line is a “&” character, the command is assumed to continue on the next line. The next line is concatenated to the previous line by removing the “&” character and line break. This allows long commands to be continued across two or more lines. See the discussion of triple quotes in 6 for how to continue a command across multiple line without using “&” characters.

```
# this is a comment
timestep 1.0  # this is also a comment
```

2. All characters from the first “#” character onward are treated as comment and discarded. The exception to this rule is described in 6. Note that a comment after a trailing “&” character will prevent the command from continuing on the next line. Also note that for multi-line commands a single leading “#” will comment out the entire command.

3. The line is searched repeatedly for $ characters, which indicate variables that are replaced with a text string. The exception to this rule is described in 6.

If the $ is followed by text in curly brackets ‘{}’, then the variable name is the text inside the curly brackets. If no curly brackets follow the $, then the variable name is the single character immediately following the $. Thus ${myTemp} and $x refer to variables named “myTemp” and “x”, while “$xx” will be interpreted as a variable named “x” followed by an “x” character.

How the variable is converted to a text string depends on what style of variable it is; see the variable doc page for details. It can be a variable that stores multiple text strings, and return one of them. The returned text string can be multiple “words” (space separated) which will then be interpreted as multiple arguments in the input command. The variable can also store a numeric formula which will be evaluated and its numeric result returned as a string.

As a special case, if the $ is followed by parenthesis “()”, then the text inside the parenthesis is treated as an “immediate” variable and evaluated as an equal-style variable. This is a way to use numeric formulas in an input script without having to assign them to variable names. For example, these 3 input script lines:

```
variable X equal (xlo+xhi)/2+sqrt(v_area)
region 1 block $X 2 INF INF EDGE EDGE
variable X delete
```

can be replaced by:

```
region 1 block $((xlo+xhi)/2+sqrt(v_area)) 2 INF INF EDGE EDGE
```

so that you do not have to define (or discard) a temporary variable, “X” in this case.

Additionally, the “immediate” variable expression may be followed by a colon, followed by a C-style format string, e.g. “:%f” or “:%.10g”. The format string must be appropriate for a double-precision floating-point value. The format string is used to output the result of the variable expression evaluation. If a format string is not specified a high-precision “%.20g” is used as the default.

This can be useful for formatting print output to a desired precision:

```
print "Final energy per atom: $(pe/atoms:%10.3f) eV/atom"
```
Note that neither the curly-bracket or immediate form of variables can contain nested $ characters for other variables to substitute for. Thus you may **NOT** do this:

```
variable a equal 2
variable b2 equal 4
print "B2 = ${b$a}"
```

Nor can you specify an expression like “$(x-1.0)” for an immediate variable, but you could use $(v_x-1.0), since the latter is valid syntax for an *equal-style variable.*

See the `variable` command for more details of how strings are assigned to variables and evaluated, and how they can be used in input script commands.

4. The line is broken into “words” separated by white-space (tabs, spaces). Note that words can thus contain letters, digits, underscores, or punctuation characters.

5. The first word is the command name. All successive words in the line are arguments.

6. If you want text with spaces to be treated as a single argument, it can be enclosed in either single or double or triple quotes. A long single argument enclosed in single or double quotes can span multiple lines if the “&” character is used, as described above. When the lines are concatenated together (and the “&” characters and line breaks removed), the text will become a single line. If you want multiple lines of an argument to retain their line breaks, the text can be enclosed in triple quotes, in which case “&” characters are not needed. For example:

```
print "Volume = $v"
print 'Volume = $v'
if "${steps} > 1000" then quit
variable a string "red green blue &
               purple orange cyan"
print ""
System volume = $v
System temperature = $t
""
```

In each case, the single, double, or triple quotes are removed when the single argument they enclose is stored internally.

See the `dump modify format`, `print`, `if`, and `python` commands for examples.

A “#” or “$” character that is between quotes will not be treated as a comment indicator in 2 or substituted for as a variable in 3.

**Note:** If the argument is itself a command that requires a quoted argument (e.g. using a `print` command as part of an `if` or `run every` command), then single, double, or triple quotes can be nested in the usual manner. See the doc pages for those commands for examples. Only one level of nesting is allowed, but that should be sufficient for most use cases.
5.3 Input script structure

This page describes the structure of a typical LAMMPS input script. The examples directory in the LAMMPS distribution contains many sample input scripts; it is discussed on the Examples doc page.

A LAMMPS input script typically has 4 parts:

1. **Initialization**
2. **System definition**
3. **Simulation settings**
4. **Run a simulation**

The last 2 parts can be repeated as many times as desired. I.e. run a simulation, change some settings, run some more, etc. Each of the 4 parts is now described in more detail. Remember that almost all commands need only be used if a non-default value is desired.

### 5.3.1 Initialization

Set parameters that need to be defined before atoms are created or read-in from a file.

The relevant commands are `units`, `dimension`, `newton`, `processors`, `boundary`, `atom_style`, `atom_modify`.

If force-field parameters appear in the files that will be read, these commands tell LAMMPS what kinds of force fields are being used: `pair_style`, `bond_style`, `angle_style`, `dihedral_style`, `improper_style`.

### 5.3.2 System definition

There are 3 ways to define the simulation cell and reserve space for force field info and fill it with atoms in LAMMPS. Read them in from (1) a data file or (2) a restart file via the `read_data` or `read_restart` commands, respectively. These files can also contain molecular topology information. Or (3) create a simulation cell and fill it with atoms on a lattice (with no molecular topology), using these commands: `lattice`, `region`, `create_box`, `create_atoms` or `read_dump`.

The entire set of atoms can be duplicated to make a larger simulation using the `replicate` command.

### 5.3.3 Simulation settings

Once atoms and molecular topology are defined, a variety of settings can be specified: force field coefficients, simulation parameters, output options, and more.

Force field coefficients are set by these commands (they can also be set in the read-in files): `pair_coeff`, `bond_coeff`, `angle_coeff`, `dihedral_coeff`, `improper_coeff`, `kspace_style`, `dielectric`, `special_bonds`.

Various simulation parameters are set by these commands: `neighbor`, `neigh_modify`, `group`, `timestep`, `reset_timestep`, `run_style`, `min_style`, `min_modify`.

Fixes impose a variety of boundary conditions, time integration, and diagnostic options. The `fix` command comes in many flavors.

Various computations can be specified for execution during a simulation using the `compute`, `compute_modify`, and `variable` commands.

Output options are set by the `thermo`, `dump`, and `restart` commands.
5.3.4 Run a simulation

A molecular dynamics simulation is run using the `run` command. Energy minimization (molecular statics) is performed using the `minimize` command. A parallel tempering (replica-exchange) simulation can be run using the `temper` command.

5.4 Commands by category

This page lists most of the LAMMPS commands, grouped by category. The General commands doc page lists all general commands alphabetically. Style options for entries like fix, compute, pair etc. have their own pages where they are listed alphabetically.

5.4.1 Initialization:

```
newton  package  processors  suffix  units
```

5.4.2 Setup simulation box:

```
boundary  box  change_box  create_box
dimension  lattice  region
```

5.4.3 Setup atoms:

```
atom_modify  atom_style  balance  create_atoms
create_bonds  delete_atoms  delete_bonds  displace_atoms
group  mass  molecule  read_data
read_dump  read_restart  replicate  set
velocity
```

5.4.4 Force fields:

```
angle_coeff  angle_style  bond_coeff  bond_style
bond_write  dielectric  dihedral_coeff  dihedral_style
improper_coeff  improper_style  kspace_modify  kspace_style
pair_coeff  pair_modify  pair_style  pair_write
special_bonds
```
5.4.5 Settings:

5.13 KSpace solvers

All LAMMPS kspace_style solvers. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = USER-INTEL, k = KOKKOS, o = USER-OMP, t = OPT.

```
 ewald (o)  ewald/disp  ewald/dipole  ewald/dipole/spin
   msm (o)    msm/cg (o)  pppm (giko)  pppm/cg (o)
pppm/dipole  pppm/dipole/spin  pppm/disp (io)  pppm/disp/tip4p (o)
pppm/stagger  pppm/tip4p (o)    scafaos
```

5.14 Removed commands and packages

This page lists LAMMPS commands and packages that have been removed from the distribution and provides suggestions for alternatives or replacements. LAMMPS has special dummy styles implemented, that will stop LAMMPS and print a suitable error message in most cases, when a style/command is used that has been removed.

5.14.1 Fix ave/spatial and fix ave/spatial/sphere

The fixes ave/spatial and ave/spatial/sphere have been removed from LAMMPS since they were superseded by the more general and extensible “chunk infrastructure”. Here the system is partitioned in one of many possible ways through the compute chunk/atom command and then averaging is done using fix ave/chunk. Please refer to the chunk HOWTO section for an overview.
5.14.2 Reset_ids command

The reset_ids command has been renamed to reset_atom_ids.

5.14.3 MEAM package

The MEAM package has been removed since it was superseded by the USER-MEAMC package. The code in the USER-MEAMC package is a translation of the Fortran code of MEAM into C++, which removes several restrictions (e.g. there can be multiple instances in hybrid pair styles) and allows for some optimizations leading to better performance. The new pair style meam/c has the exact same syntax as the old “meam” pair style and thus pair style meam is an alias to the new style and backward compatibility of old inputs is preserved.

5.14.4 REAX package

The REAX package has been removed since it was superseded by the USER-REAXC package. The USER-REAXC package has been tested to yield equivalent results to the REAX package, offers better performance, supports OpenMP multi-threading via USER-OMP, and GPU and threading parallelization through KOKKOS. The new pair styles are not syntax compatible with the removed reax pair style, so input files will have to be adapted.

5.14.5 USER-CUDA package

The USER-CUDA package had been removed, since it had been unmaintained for a long time and had known bugs and problems. Significant parts of the design were transferred to the KOKKOS package, which has similar performance characteristics on NVIDIA GPUs. Both, the KOKKOS and the GPU package are maintained and allow running LAMMPS with GPU acceleration.

5.14.6 restart2data tool

The functionality of the restart2data tool has been folded into the LAMMPS executable directly instead of having a separate tool. A combination of the commands read_restart and write_data can be used to the same effect. For added convenience this conversion can also be triggered by command line flags.
This section gives an overview of the optional packages that extend LAMMPS functionality. Packages are groups of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. You can see the list of all packages and “make” commands to manage them by typing “make package” from within the src directory of the LAMMPS distribution. The Build package doc page gives general info on how to install and un-install packages as part of the LAMMPS build process.

6.1 Standard packages

This is the list of standard packages in LAMMPS. The link for each package name gives more details.

Standard packages are supported by the LAMMPS developers and are written in a syntax and style consistent with the rest of LAMMPS. This means the developers will answer questions about them, debug and fix them if necessary, and keep them compatible with future changes to LAMMPS.

The “Example” column is a sub-directory in the examples directory of the distribution which has an input script that uses the package. E.g. “peptide” refers to the examples/peptide directory; USER/atc refers to the examples/USER/atc directory. The “Library” column indicates whether an extra library is needed to build and use the package:

- no = no library
- sys = system library: you likely have it on your machine
- int = internal library: provided with LAMMPS, but you may need to build it
- ext = external library: you will need to download and install it on your machine

### 6.2 User packages

This is a list of user packages in LAMMPS. The link for each package name gives more details.

User packages have been contributed by users, and begin with the “user” prefix. If a contribution is a single command (single file), it is typically in the USER-MISC package. User packages don’t necessarily meet the requirements of the standard packages. This means the developers will try to keep things working and usually can answer technical questions about compiling the package. If you have problems using a specific feature provided in a user package, you may need to contact the contributor directly to get help. Information on how to submit additions you make to LAMMPS as single files or as a standard or user package is explained on the Modify contribute doc page.

The “Example” column is a sub-directory in the examples directory of the distribution which has an input script that uses the package. E.g. “peptide” refers to the examples/peptide directory; USER/atc refers to the examples/USER/atc directory. The “Library” column indicates whether an extra library is needed to build and use the package:

- no = no library
- sys = system library: you likely have it on your machine
- int = internal library: provided with LAMMPS, but you may need to build it
- ext = external library: you will need to download and install it on your machine

</tbody>
</table>

6.3 Package details

Here is a brief description of all the standard and user packages in LAMMPS. It lists authors (if applicable) and summarizes the package contents. It has specific instructions on how to install the package, including, if necessary, info on how to download or build any extra library it requires. It also gives links to documentation, example scripts, and pictures/movies (if available) that illustrate use of the package.

The majority of packages can be included in a LAMMPS build with a single setting (-D PGK_NAME for CMake) or command (“make yes-name” for make). See the Build package doc page for more info. A few packages may require additional steps; this is indicated in the descriptions below. The Build extras doc page gives those details.

Note: To see the complete list of commands a package adds to LAMMPS, you can examine the files in its src directory, e.g. “ls src/GRANULAR”. Files with names that start with fix, compute, atom, pair, bond, angle, etc correspond to commands with the same style name as contained in the file name.
6.3.1 ASPHERE package

Contents:
Computes, time-integration fixes, and pair styles for aspherical particle models including ellipsoids, 2d lines, and 3d triangles.

Supporting info:
- src/ASPHERE: filenames -> commands
- Howto spherical
- pair_style gayberne
- pair_style resquared
- doc/PDF/pair_gayberne_extra.pdf
- doc/PDF/pair_resquared_extra.pdf
- examples/ASPHERE
- examples/ellipse
- https://lammps.sandia.gov/movies.html#line
- https://lammps.sandia.gov/movies.html#tri
6.3.2 BODY package

Contents:
Body-style particles with internal structure. Computes, time-integration fixes, pair styles, as well as the body styles themselves. See the Howto body doc page for an overview.

Supporting info:
- src/BODY filenames -> commands
- Howto_body
- atom_style body
- fix nve/body
- pair_style body/nparticle
- examples/body

6.3.3 CLASS2 package

Contents:
Bond, angle, dihedral, improper, and pair styles for the COMPASS CLASS2 molecular force field.

Supporting info:
- src/CLASS2: filenames -> commands
- bond_style class2
- angle_style class2
- dihedral_style class2
- improper_style class2
- pair_style lj/class2

6.3.4 COLLOID package

Contents:
Coarse-grained finite-size colloidal particles. Pair styles and fix wall styles for colloidal interactions. Includes the Fast Lubrication Dynamics (FLD) method for hydrodynamic interactions, which is a simplified approximation to Stokesian dynamics.

Authors: This package includes Fast Lubrication Dynamics pair styles which were created by Amit Kumar and Michael Bybee from Jonathan Higdon’s group at UIUC.

Supporting info:
- src/COLLOID: filenames -> commands
- fix wall/colloid
- pair_style colloid
6.3.5 COMPRESS package

Contents:
Compressed output of dump files via the zlib compression library, using dump styles with a “gz” in their style name. To use this package you must have the zlib compression library available on your system.

Author: Axel Kohlmeyer (Temple U).

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/COMPRESS: filenames -> commands
- src/COMPRESS/README
- lib/compress/README
- dump atom/gz
- dump cfg/gz
- dump custom/gz
- dump xyz/gz

6.3.6 CORESHELL package

Contents:
Compute and pair styles that implement the adiabatic core/shell model for polarizability. The pair styles augment Born, Buckingham, and Lennard-Jones styles with core/shell capabilities. The compute temp/cs command calculates the temperature of a system with core/shell particles. See the Howto coreshell doc page for an overview of how to use this package.

Author: Hendrik Heenen (Technical U of Munich).

Supporting info:
- src/CORESHELL: filenames -> commands
- Howto coreshell
- Howto polarizable
6.3.7 DIPOLE package

Contents:
An atom style and several pair styles for point dipole models with short-range or long-range interactions.

Supporting info:
- src/DIPOLE: filenames -> commands
- atom_style dipole
- pair_style lj/cut/dipole/cut
- pair_style lj/cut/dipole/long
- pair_style lj/long/dipole/long
- examples/dipole

6.3.8 GPU package

Contents:
Dozens of pair styles and a version of the PPPM long-range Coulombic solver optimized for GPUs. All such styles have a "gpu" as a suffix in their style name. The GPU code can be compiled with either CUDA or OpenCL, however the OpenCL variants are no longer actively maintained and only the CUDA versions are regularly tested. The GPU package page gives details of what hardware and GPU software is required on your system, and details on how to build and use this package. Its styles can be invoked at run time via the "-sf gpu" or "-suffix gpu" command-line switches. See also the KOKKOS package, which has GPU-enabled styles.

Authors: Mike Brown (Intel) while at Sandia and ORNL and Trung Nguyen (Northwestern U) while at ORNL and later. AMD HIP support by Evgeny Kuznetsov, Vladimir Stegailov, and Vsevolod Nikolskiy (HSE University).

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/GPU: filenames -> commands
- src/GPU/README
- lib/gpu/README
- Accelerator packages
- GPU package
6.3.9 GRANULAR package

Contents:
Pair styles and fixes for finite-size granular particles, which interact with each other and boundaries via frictional and dissipative potentials.

Supporting info:
- src/GRANULAR: filenames -> commands
- Howto granular
- fix pour
- fix wall/gran
- pair_style gran/hooke
- pair_style gran/hertz/history
- examples/granregion
- examples/pour
- bench/in.chute
- https://lammps.sandia.gov/pictures.html#jamming
- https://lammps.sandia.gov/movies.html#hopper
- https://lammps.sandia.gov/movies.html#dem
- https://lammps.sandia.gov/movies.html#brazil
- https://lammps.sandia.gov/movies.html#granregion

6.3.10 KIM package

Contents:
This package contains a set of commands that serve as a wrapper on the Open Knowledgebase of Interatomic Models (OpenKIM) repository of interatomic models (IMs) enabling compatible ones to be used in LAMMPS simulations.

This includes kim_init, and kim_interactions commands to select, initialize and instantiate the IM, a kim_query command to perform web queries for material property predictions of OpenKIM IMs, a kim_param command to access KIM Model Parameters from LAMMPS, and a kim_property command to write material properties computed in LAMMPS to standard KIM property instance format.
Support for KIM IMs that conform to the KIM Application Programming Interface (API) is provided by the `pair_style kim` command.

**Note:** The command `pair_style kim` is called by `kim_interactions` and is not recommended to be directly used in input scripts.

To use this package you must have the KIM API library available on your system. The KIM API is available for download on the OpenKIM website. When installing LAMMPS from binary, the kim-api package is a dependency that is automatically downloaded and installed.

Information about the KIM project can be found at its website: https://openkim.org. The KIM project is led by Ellad Tadmor and Ryan Elliott (U Minnesota) and is funded by the National Science Foundation.

**Authors:** Ryan Elliott (U Minnesota) is the main developer for the KIM API and the `pair_style kim` command. Yaser Afshar (U Minnesota), Axel Kohlmeyer (Temple U), Ellad Tadmor (U Minnesota), and Daniel Karls (U Minnesota) contributed to the `kim_commands` interface in close collaboration with Ryan Elliott.

**Install:**

This package has specific installation instructions on the Build extras doc page.

**Supporting info:**

- `kim_commands`
- `pair_style kim`
- src/KIM: filenames -> commands
- src/KIM/README
- lib/kim/README
- examples/kim

### 6.3.11 KOKKOS package

**Contents:**

Dozens of atom, pair, bond, angle, dihedral, improper, fix, compute styles adapted to compile using the Kokkos library which can convert them to OpenMP or CUDA code so that they run efficiently on multicore CPUs, KNLs, or GPUs. All the styles have a “kk” as a suffix in their style name. The KOKKOS package doc page gives details of what hardware and software is required on your system, and how to build and use this package. Its styles can be invoked at run time via the “-sf kk” or “-suffix kk” command-line switches. Also see the `GPU`, `OPT`, `USER-INTEL`, and `USER-OMP` packages, which have styles optimized for CPUs, KNLs, and GPUs.

You must have a C++11 compatible compiler to use this package. KOKKOS makes extensive use of advanced C++ features, which can expose compiler bugs, especially when compiling for maximum performance at high optimization levels. Please see the file lib/kokkos/README for a list of compilers and their respective platforms, that are known to work.

**Authors:** The KOKKOS package was created primarily by Christian Trott and Stan Moore (Sandia), with contributions from other folks as well. It uses the open-source Kokkos library which was developed by Carter Edwards, Christian Trott, and others at Sandia, and which is included in the LAMMPS distribution in lib/kokkos.

**Install:**

This package has specific installation instructions on the Build extras doc page.
6.3.12 KSPACE package

Contents:

A variety of long-range Coulombic solvers, as well as pair styles which compute the corresponding short-range pair-wise Coulombic interactions. These include Ewald, particle-particle particle-mesh (PPPM), and multilevel summation method (MSM) solvers.

Install:

Building with this package requires a 1d FFT library be present on your system for use by the PPPM solvers. This can be the KISS FFT library provided with LAMMPS, third party libraries like FFTW, or a vendor-supplied FFT library. See the Build settings doc page for details on how to select different FFT options for your LAMMPS build.

Supporting info:

- src/KSPACE: filenames -> commands
- kspace_style
- doc/PDF/kspace.pdf
- Howto tip3p
- Howto tip4p
- Howto spc
- pair_style coul
- Search the pair style page for styles with “long” or “msm” in name
- examples/peptide
- bench/in.rhodo
6.3.13 LATTE package

Contents:

A fix command which wraps the LATTE DFTB code, so that molecular dynamics can be run with LAMMPS using density-functional tight-binding quantum forces calculated by LATTE.

More information on LATTE can be found at this web site: https://github.com/lanl/LATTE. A brief technical description is given with the fix latte command.

Authors: Christian Negre (LANL) and Steve Plimpton (Sandia). LATTE itself is developed at Los Alamos National Laboratory by Marc Cawkwell, Anders Niklasson, and Christian Negre.

Install:

This package has specific installation instructions on the Build extras doc page.

Supporting info:

- src/LATTE: filenames -> commands
- src/LATTE/README
- lib/latte/README
- fix latte
- examples/latte
- LAMMPS-LATTE tutorial

6.3.14 MANYBODY package

Contents:

A variety of many-body and bond-order potentials. These include (AI)REBO, BOP, EAM, EIM, Stillinger-Weber, and Tersoff potentials.

Supporting info:

- src/MANYBODY: filenames -> commands
- Pair style page
- examples/comb
- examples/eim
- examples/nb3d
- examples/shear
- examples/streitz
- examples/vashishta
- bench/in.eam
6.3.15 MC package

Contents:
Several fixes and a pair style that have Monte Carlo (MC) or MC-like attributes. These include fixes for creating, breaking, and swapping bonds, for performing atomic swaps, and performing grand-canonical MC (GCMC) in conjunction with dynamics.

Supporting info:
- src/MC: filenames -> commands
- fix atom/swap
- fix bond/break
- fix bond/create
- fix bond/swap
- fix gcmc
- pair_style dsmc
- https://lammps.sandia.gov/movies.html#gcmc

6.3.16 MESSAGE package

Contents:
Commands to use LAMMPS as either a client or server and couple it to another application.

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/MESSAGE: filenames -> commands
- lib/message/README
- message
- fix client/md
- server md
- server mc
- examples/message
6.3.17 MISC package

Contents:
A variety of compute, fix, pair, dump styles with specialized capabilities that don’t align with other packages. Do a directory listing, “ls src/MISC”, to see the list of commands.

Note: the MISC package contains styles that require using the -restrict flag, when compiling with Intel compilers.

Supporting info:
- src/MISC: filenames -> commands
- compute ti
- fix evaporate
- fix orient/fcc
- fix ttm
- fix thermal/conductivity
- fix viscosity
- examples/KAPPA
- examples/VISCOSITY
- https://lammps.sandia.gov/pictures.html#ttm
- https://lammps.sandia.gov/movies.html#evaporation

6.3.18 MLIAP package

Contents:
A general interface for machine-learning interatomic potentials.

Install:
To use this package, also the SNAP package needs to be installed.

Author: Aidan Thompson (Sandia).

Supporting info:
- src/MLIAP: filenames -> commands
- pair_style mliap
- examples/mliap
6.3.19 MOLECULE package

Contents:
A large number of atom, pair, bond, angle, dihedral, improper styles that are used to model molecular systems with fixed covalent bonds. The pair styles include the Dreiding (hydrogen-bonding) and CHARMM force fields, and a TIP4P water model.

Supporting info:
- src/MOLECULE: filenames -> commands
- atom_style
- bond_style
- angle_style
- dihedral_style
- improper_style
- pair_style hbond/dreiding/lj
- pair_style lj/charmm/coul/charmm
- Howto bioFF
- examples/cmap
- examples/dreiding
- examples/micelle,
- examples/peptide
- bench/in.chain
- bench/in.rhodo

6.3.20 MPIIO package

Contents:
Support for parallel output/input of dump and restart files via the MPIIO library. It adds dump styles with a “mpiio” in their style name. Restart files with an “.mpiio” suffix are also written and read in parallel.

Supporting info:
- src/mpiio: filenames -> commands
- dump
- restart
- write_restart
- read_restart
6.3.21 MSCG package

Contents:

A fix mscg command which can parameterize a Multi-Scale Coarse-Graining (MSCG) model using the open-source MS-CG library.

To use this package you must have the MS-CG library available on your system.

Authors: The fix was written by Lauren Abbott (Sandia). The MS-CG library was developed by Jacob Wagner in Greg Voth’s group at the University of Chicago.

Install:

This package has specific installation instructions on the Build extras doc page.

Supporting info:

- src/MSCG: filenames -> commands
- src/MSCG/README
- lib/mscg/README
- examples/mscg

6.3.22 OPT package

Contents:

A handful of pair styles which are optimized for improved CPU performance on single or multiple cores. These include EAM, LJ, CHARMM, and Morse potentials. The styles have an “opt” suffix in their style name. The OPT package doc page gives details of how to build and use this package. Its styles can be invoked at run time via the “-sf opt” or “-suffix opt” command-line switches. See also the KOKKOS, USER-INTEL, and USER-OMP packages, which have styles optimized for CPU performance.

Authors: James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technology).

Install:

This package has specific installation instructions on the Build extras doc page.

Supporting info:

- src/OPT: filenames -> commands
- Accelerator packages
- OPT package
- Section 2.6 -sf opt
- Search the pair style page for styles followed by (t)
- Benchmarks page of web site
6.3.23 PERI package

Contents:
An atom style, several pair styles which implement different Peridynamics materials models, and several computes which calculate diagnostics. Peridynamics is a particle-based meshless continuum model.

Authors: The original package was created by Mike Parks (Sandia). Additional Peridynamics models were added by Rezwanur Rahman and John Foster (UTSA).

Supporting info:
- src/PERI: filenames -> commands
- doc/PDF/PDLammps_overview.pdf
- doc/PDF/PDLammps_EPS.pdf
- doc/PDF/PDLammps_VES.pdf
- atom_style peri
- pair_style peri/*
- compute damage/atom
- compute plasticity/atom
- examples/peri
- https://lammps.sandia.gov/movies.html#peri

6.3.24 POEMS package

Contents:
A fix that wraps the Parallelizable Open source Efficient Multibody Software (POEMS) library, which is able to simulate the dynamics of articulated body systems. These are systems with multiple rigid bodies (collections of particles) whose motion is coupled by connections at hinge points.

Author: Rudra Mukherjee (JPL) while at RPI.

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/POEMS: filenames -> commands
- src/POEMS/README
- lib/poems/README
- fix poems
- examples/rigid
6.3.25 PYTHON package

Contents:
A *python* command which allow you to execute Python code from a LAMMPS input script. The code can be in a separate file or embedded in the input script itself. See the *Python call* doc page for an overview of using Python from LAMMPS in this manner and all the *Python* doc pages for other ways to use LAMMPS and Python together.

Note: Building with the PYTHON package assumes you have a Python shared library available on your system, which needs to be a Python 2 version, 2.6 or later. Python 3 is not yet supported. See the lib/python/README for more details.

Install:
This package has *specific installation instructions* on the *Build extras* doc page.

Supporting info:
- src/PYTHON: filenames -> commands
- *Python call*
- lib/python/README
- examples/python

6.3.26 QEQ package

Contents:
Several fixes for performing charge equilibration (QEq) via different algorithms. These can be used with pair styles that perform QEq as part of their formulation.

Supporting info:
- src/QEQ: filenames -> commands
- *fix qeq*/
- examples/qeq
- examples/streitz

6.3.27 REPLICA package

Contents:
A collection of multi-replica methods which can be used when running multiple LAMMPS simulations (replicas). See the *Howto replica* doc page for an overview of how to run multi-replica simulations in LAMMPS. Methods in the package include nudged elastic band (NEB), parallel replica dynamics (PRD), temperature accelerated dynamics (TAD), parallel tempering, and a verlet/split algorithm for performing long-range Coulombics on one set of processors, and the remainder of the force field calculation on another set.

Supporting info:
- src/REPLICA: filenames -> commands
6.3.28 RIGID package

Contents:
Fixes which enforce rigid constraints on collections of atoms or particles. This includes SHAKE and RATTLE, as well as various rigid-body integrators for a few large bodies or many small bodies. Also several computes which calculate properties of rigid bodies.

Supporting info:
- src/RIGID: filenames -> commands
- compute erotate/rigid
- fix shake
- fix rattle
- fix rigid/*
- examples/ASPHERE
- examples/rigid
- bench/in.rhodo
- https://lammps.sandia.gov/movies.html#box
- https://lammps.sandia.gov/movies.html#star

6.3.29 SHOCK package

Contents:
Fixes for running impact simulations where a shock-wave passes through a material.

Supporting info:
- src/SHOCK: filenames -> commands
- fix append/atoms
- fix msst
• fix nphug
• fix wall/piston
• examples/hugoniostat
• examples/msst

6.3.30 SNAP package

Contents:
A pair style for the spectral neighbor analysis potential (SNAP). SNAP is methodology for deriving a highly accurate classical potential fit to a large archive of quantum mechanical (DFT) data. Also several computes which analyze attributes of the potential.

Author: Aidan Thompson (Sandia).

Supporting info:
• src/SNAP: filenames -> commands
• pair_style snap
• compute sna/atom
• compute snad/atom
• compute snav/atom
• examples/snap

6.3.31 SPIN package

Contents:
Model atomic magnetic spins classically, coupled to atoms moving in the usual manner via MD. Various pair, fix, and compute styles.

Author: Julien Tranchida (Sandia).

Supporting info:
• src/SPIN: filenames -> commands
• Howto spins
• pair_style spin/dipole/cut
• pair_style spin/dipole/long
• pair_style spin/dmi
• pair_style spin/exchange
• pair_style spin/magelec
• pair_style spin/neel
• fix nve/spin
• fix precession/spin
• compute spin
• neb/spin
• examples/SPIN

### 6.3.32 SRD package

**Contents:**
A pair of fixes which implement the Stochastic Rotation Dynamics (SRD) method for coarse-graining of a solvent, typically around large colloidal particles.

**Supporting info:**
- src/SRD: filenames -> commands
- fix srd
- fix wall/srd
- examples/srd
- examples/ASPERE
- https://lammps.sandia.gov/movies.html#tri
- https://lammps.sandia.gov/movies.html#line
- https://lammps.sandia.gov/movies.html#poly

### 6.3.33 VORONOI package

**Contents:**
A compute command which calculates the Voronoi tesselation of a collection of atoms by wrapping the Voro++ library. This can be used to calculate the local volume or each atoms or its near neighbors.

To use this package you must have the Voro++ library available on your system.

**Author:** Daniel Schwen (INL) while at LANL. The open-source Voro++ library was written by Chris Rycroft (Harvard U) while at UC Berkeley and LBNL.

**Install:**
This package has specific installation instructions on the Build extras doc page.

**Supporting info:**
- src/VORONOI: filenames -> commands
- src/VORONOI/README
- lib/voronoi/README
- compute voronoi/atom
- examples/vorono
6.3.34 USER-ADIOS package

Contents:
ADIOS is a high-performance I/O library. This package implements the `dump atom/adios`, `dump custom/adios` and `read_dump` commands to write and read data using the ADIOS library.

Authors: Norbert Podhorszki (ORNL) from the ADIOS developer team.

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/USER-ADIOS: filenames -> commands
- src/USER-ADIOS/README
- examples/USER/adios
- https://github.com/ornladios/ADIOS2
- `dump atom/adios`
- `dump custom/adios`
- `read_dump`

6.3.35 USER-ATC package

Contents:
ATC stands for atoms-to-continuum. This package implements a `fix atc` command to either couple molecular dynamics with continuum finite element equations or perform on-the-fly conversion of atomic information to continuum fields.

Authors: Reese Jones, Jeremy Templeton, Jon Zimmerman (Sandia).

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/USER-ATC: filenames -> commands
- src/USER-ATC/README
- `fix atc`
- examples/USER/atc
- https://lammps.sandia.gov/pictures.html#atc
6.3.36 USER-AWPMD package

Contents:
AWPMD stands for Antisymmetrized Wave Packet Molecular Dynamics. This package implements an atom, pair, and fix style which allows electrons to be treated as explicit particles in a classical molecular dynamics model.

Author: Ilya Valuev (JIHT, Russia).

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/USER-AWPMD: filenames -> commands
- src/USER-AWPMD/README
- pair_style awpmd/cut
- examples/USER/awpmd

6.3.37 USER-BOCS package

Contents:
This package provides fix bocs, a modified version of fix npt which includes the pressure correction to the barostat as outlined in:

Authors: Nicholas J. H. Dunn and Michael R. DeLyser (The Pennsylvania State University)

Supporting info:
The USER-BOCS user package for LAMMPS is part of the BOCS software package: https://github.com/noid-group/BOCS

See the following reference for information about the entire package:

Example inputs are in the examples/USER/bocs folder.

6.3.38 USER-CGDNA package

Contents:
Several pair styles, bond styles, and integration fixes for coarse-grained modelling of single- and double-stranded DNA and RNA based on the oxDNA and oxRNA model of Doye, Louis and Ouldridge. The package includes Langevin-type rigid-body integrators with improved stability.

Author: Oliver Henrich (University of Strathclyde, Glasgow).

Supporting info:
6.3.39 USER-CGSDK package

Contents:
Several pair styles and an angle style which implement the coarse-grained SDK model of Shinoda, DeVane, and Klein which enables simulation of ionic liquids, electrolytes, lipids and charged amino acids.

Author: Axel Kohlmeyer (Temple U).

Supporting info:
- src/USER-CGSDK: filenames -> commands
- src/USER-CGSDK/README
- pair_style lj/sdk/*
- angle_style sdk
- examples/USER/cg-sdk
- https://lammps.sandia.gov/pictures.html#cg

6.3.40 USER-COLVARS package

Contents:
COLVARS stands for collective variables, which can be used to implement various enhanced sampling methods, including Adaptive Biasing Force, Metadynamics, Steered MD, Umbrella Sampling and Restraints. A fix colvars command is implemented which wraps a COLVARS library, which implements these methods. simulations.

Authors: The COLVARS library is written and maintained by Giacomo Fiorin (ICMS, Temple University, Philadelphia, PA, USA) and Jerome Henin (LISM, CNRS, Marseille, France), originally for the NAMD MD code, but with portability in mind. Axel Kohlmeyer (Temple U) provided the interface to LAMMPS.

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/USER-COLVARS: filenames -> commands
6.3.41 USER-PLUMED package

Contents:
The fix plumed command allows you to use the PLUMED free energy plugin for molecular dynamics to analyze and bias your LAMMPS trajectory on the fly. The PLUMED library is called from within the LAMMPS input script by using the `fix plumed` command.

Authors: The PLUMED library is written and maintained by Massimilliano Bonomi, Giovanni Bussi, Carlo Camiloni and Gareth Tribello.

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- `src/USER-PLUMED/README`
- `lib/plumed/README`
- `fix plumed`
- `examples/USER/plumed`

6.3.42 USER-DIFFRACTION package

Contents:
Two computes and a fix for calculating x-ray and electron diffraction intensities based on kinematic diffraction theory.

Author: Shawn Coleman while at the U Arkansas.

Supporting info:
- `src/USER-DIFFRACTION: filenames -> commands`
  - `compute saed`
  - `compute xrd`
  - `fix saed/vtk`
  - `examples/USER/diffraction`
6.3.43 USER-DPD package

Contents:
DPD stands for dissipative particle dynamics. This package implements coarse-grained DPD-based models for energetic, reactive molecular crystalline materials. It includes many pair styles specific to these systems, including for reactive DPD, where each particle has internal state for multiple species and a coupled set of chemical reaction ODEs are integrated each timestep. Highly accurate time integrators for isothermal, isoenergetic, isobaric and isenthalpic conditions are included. These enable long timesteps via the Shardlow splitting algorithm.

Authors: Jim Larentzos (ARL), Tim Mattox (Engility Corp), and John Brennan (ARL).

Supporting info:
- src/USER-DPD: filenames -> commands
- /src/USER-DPD/README
- compute dpd
- compute dpd/atom
- fix eos/cv
- fix eos/table
- fix eos/table/rx
- fix shardlow
- fix rx
- pair_style table/rx
- pair_style dpd/fdt
- pair_style dpd/fdt/energy
- pair_style exp6/rx
- pair_style multi/lucy
- pair_style multi/lucy/rx
- examples/USER/dpd

6.3.44 USER-DRUDE package

Contents:
Fixes, pair styles, and a compute to simulate thermalized Drude oscillators as a model of polarization. See the Howto drude and Howto drude2 doc pages for an overview of how to use the package. There are auxiliary tools for using this package in tools/drude.

Authors: Alain Dequidt (U Blaise Pascal Clermont-Ferrand), Julien Devemy (CNRS), and Agilio Padua (U Blaise Pascal).

Supporting info:
- src/USER-DRUDE: filenames -> commands
- Howto drude
- Howto drude2
6.3.45 USER-EFF package

Contents:

EFF stands for electron force field which allows a classical MD code to model electrons as particles of variable radius. This package contains atom, pair, fix and compute styles which implement the eFF as described in A. Jaramillo-Botero, J. Su, Q. An, and W.A. Goddard III, JCC, 2010. The eFF potential was first introduced by Su and Goddard, in 2007. There are auxiliary tools for using this package in tools/eff; see its README file.

Author: Andres Jaramillo-Botero (CalTech).

Supporting info:

- src/USER-EFF: filenames -> commands
- src/USER-EFF/README
- atom_style electron
- fix nve/eff
- fix nvt/eff
- fix npt/eff
- fix langevin/eff
- compute temp/eff
- pair_style eff/cut
- pair_style eff/inline
- examples/USER/eff
- tools/eff/README
- tools/eff
- https://lammps.sandia.gov/movies.html#eff
6.3.46 USER-FEP package

Contents:

FEP stands for free energy perturbation. This package provides methods for performing FEP simulations by using a `fix adapt/fep` command with soft-core pair potentials, which have a “soft” in their style name. There are auxiliary tools for using this package in tools/fep; see its README file.

Author: Agilio Padua (Universite Blaise Pascal Clermont-Ferrand)

Supporting info:

- src/USER-FEP: filenames -> commands
- src/USER-FEP/README
- `fix adapt/fep`
- `compute fep`
- `pair_style */soft`
- examples/USER/fep
- tools/fep/README
- tools/fep

6.3.47 USER-H5MD package

Contents:

H5MD stands for HDF5 for MD. HDF5 is a portable, binary, self-describing file format, used by many scientific simulations. H5MD is a format for molecular simulations, built on top of HDF5. This package implements a `dump h5md` command to output LAMMPS snapshots in this format.

To use this package you must have the HDF5 library available on your system.

Author: Pierre de Buyl (KU Leuven) created both the package and the H5MD format.

Install:

This package has specific installation instructions on the Build extras doc page.

Supporting info:

- src/USER-H5MD: filenames -> commands
- src/USER-H5MD/README
- lib/h5md/README
- `dump h5md`
6.3.48 USER-INTEL package

Contents:

Dozens of pair, fix, bond, angle, dihedral, improper, and kspace styles which are optimized for Intel CPUs and KNLs (Knights Landing). All of them have an “intel” in their style name. The USER-INTEL package page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the “-sf intel” or “-suffix intel” command-line switches. Also see the KOKKOS, OPT, and USER-OMP packages, which have styles optimized for CPUs and KNLs.

You need to have an Intel compiler, version 14 or higher to take full advantage of this package. While compilation with GNU compilers is supported, performance will be sub-optimal.

Note: the USER-INTEL package contains styles that require using the -restrict flag, when compiling with Intel compilers.

Author: Mike Brown (Intel).

Install:

This package has specific installation instructions on the Build extras doc page.

Supporting info:

- src/USER-INTEL: filenames -> commands
- src/USER-INTEL/README
- Accelerator packages
- USER-INTEL package
- Section 2.6 -sf intel
- Section 2.6 -pk intel
- package intel
- Search the commands pages (fix, compute, pair, bond, angle, dihedral, improper, kspace) for styles followed by (i)
- src/USER-INTEL/TEST
- Benchmarks page of web site

6.3.49 USER-LB package

Contents:

Fixes which implement a background Lattice-Boltzmann (LB) fluid, which can be used to model MD particles influenced by hydrodynamic forces.

Authors: Frances Mackay and Colin Denniston (University of Western Ontario).

Supporting info:

- src/USER-LB: filenames -> commands
- src/USER-LB/README
- fix lb/fluid
• fix lb/momentum
• fix lb/viscous
• examples/USER/lb

6.3.50 USER-MGPT package

Contents:
A pair style which provides a fast implementation of the quantum-based MGPT multi-ion potentials. The MGPT or model GPT method derives from first-principles DFT-based generalized pseudopotential theory (GPT) through a series of systematic approximations valid for mid-period transition metals with nearly half-filled d bands. The MGPT method was originally developed by John Moriarty at LLNL. The pair style in this package calculates forces and energies using an optimized matrix-MGPT algorithm due to Tomas Oppelstrup at LLNL.

Authors: Tomas Oppelstrup and John Moriarty (LLNL).

Supporting info:
• src/USER-MGPT: filenames -> commands
• src/USER-MGPT/README
• pair_style mgpt
• examples/USER/mgpt

6.3.51 USER-MISC package

Contents:
A potpourri of (mostly) unrelated features contributed to LAMMPS by users. Each feature is a single fix, compute, pair, bond, angle, dihedral, improper, or command style.

Authors: The author for each style in the package is listed in the src/USER-MISC/README file.

Supporting info:
• src/USER-MISC: filenames -> commands
• src/USER-MISC/README
• one doc page per individual command listed in src/USER-MISC/README
• examples/USER/misc
6.3.52 USER-MANIFOLD package

Contents:
Several fixes and a “manifold” class which enable simulations of particles constrained to a manifold (a 2D surface within the 3D simulation box). This is done by applying the RATTLE constraint algorithm to formulate single-particle constraint functions \( g(x_1,y_1,z_1) = 0 \) and their derivative (i.e. the normal of the manifold) \( n = \text{grad}(g) \).

Author: Stefan Paquay (until 2017: Eindhoven University of Technology (TU/e), The Netherlands; since 2017: Brandeis University, Waltham, MA, USA)

Supporting info:
- src/USER-MANIFOLD: filenames -> commands
- src/USER-MANIFOLD/README
- Howto manifold
- fix manifoldforce
- fix nve/manifold/rattle
- fix nvt/manifold/rattle
- examples/USER/manifold
- https://lammps.sandia.gov/movies.html#manifold

6.3.53 USER-MEAMC package

Contents:
A pair style for the modified embedded atom (MEAM) potential translated from the Fortran version in the (obsolete) MEAM package to plain C++. The USER-MEAMC fully replaces the MEAM package, which has been removed from LAMMPS after the 12 December 2018 version.

Author: Sebastian Huetter, (Otto-von-Guericke University Magdeburg) based on the Fortran version of Greg Wagner (Northwestern U) while at Sandia.

Supporting info:
- src/USER-MEAMC: filenames -> commands
- src/USER-MEAMC/README
- pair_style meam/c
- examples/meamc
6.3.54 USER-MESODPD package

Contents:
Several extensions of the dissipative particle dynamics (DPD) method. Specifically, energy-conserving DPD (eDPD) that can model non-isothermal processes, many-body DPD (mDPD) for simulating vapor-liquid coexistence, and transport DPD (tDPD) for modeling advection-diffusion-reaction systems. The equations of motion of these DPD extensions are integrated through a modified velocity-Verlet (MVV) algorithm.

Author: Zhen Li (Division of Applied Mathematics, Brown University)

Supporting info:
- src/USER-MESODPD: filenames -> commands
- src/USER-MESODPD/README
- atom_style edpd
- pair_style edpd
- pair_style mdpd
- pair_style tdpd
- fix mvv/dpd
- examples/USER/mesodpd
- https://lammps.sandia.gov/movies.html#mesodpd
- examples/USER/meso
- http://lammps.sandia.gov/movies.html#mesodpd

6.3.55 USER-MESONT package

Contents:
USER-MESONT is a LAMMPS package for simulation of nanomechanics of nanotubes (NTs). The model is based on a coarse-grained representation of NTs as “flexible cylinders” consisting of a variable number of segments. Internal interactions within a NT and the van der Waals interaction between the tubes are described by a mesoscopic force field designed and parameterized based on the results of atomic-level molecular dynamics simulations. The description of the force field is provided in the papers listed below. This package contains two independent implementations of this model: pair_style mesocnt is a (minimal) C++ implementation, and pair_style mesont/tpm is a more general and feature rich implementation based on a Fortran library in the lib/mesont folder.

Download of potential files:
The potential files for these pair styles are very large and thus are not included in the regular downloaded packages of LAMMPS or the git repositories. Instead, they will be automatically downloaded from a web server when the package is installed for the first time.

Authors of the *mesont* styles:
Maxim V. Shugaev (University of Virginia), Alexey N. Volkov (University of Alabama), Leonid V. Zhigilei (University of Virginia)

Author of the *mesocnt* pair style: Philipp Kloza (U Cambridge)

Supporting info:

6.3.56 USER-MOFFF package

Contents:
Pair, angle and improper styles needed to employ the MOF-FF force field by Schmid and coworkers with LAMMPS. MOF-FF is a first principles derived force field with the primary aim to simulate MOFs and related porous framework materials, using spherical Gaussian charges. It is described in S. Bureekaew et al., Phys. Stat. Sol. B 2013, 250, 1128-1141. For the usage of MOF-FF see the example in the example directory as well as the MOF+ website.

Author: Hendrik Heenen (Technical U of Munich), Rochus Schmid (Ruhr-University Bochum).

Supporting info:
- src/USER-MOFFF: filenames -> commands
- src/USER-MOFFF/README
- pair_style buck6d/coul/gauss
- angle_style class2
- angle_style cosine/buck6d
- improper_style inversion/harmonic
- examples/USER/mofff

6.3.57 USER-MOLFILE package

Contents:
A dump molfile command which uses molfile plugins that are bundled with the VMD molecular visualization and analysis program, to enable LAMMPS to dump snapshots in formats compatible with various molecular simulation tools.

To use this package you must have the desired VMD plugins available on your system.

Note that this package only provides the interface code, not the plugins themselves, which will be accessed when requesting a specific plugin via the dump molfile command. Plugins can be obtained from a VMD installation which has to match the platform that you are using to compile LAMMPS for. By adding plugins to VMD, support for new file formats can be added to LAMMPS (or VMD or other programs that use them) without having to re-compile the application itself. More information about the VMD molfile plugins can be found at http://www.ks.uiuc.edu/Research/vmd/plugins/molfile.
**Author:** Axel Kohlmeyer (Temple U).

**Install:**

This package has *specific installation instructions* on the *Build extras* doc page.

**Supporting info:**

- src/USER-MOLFILE: filenames -> commands
- src/USER-MOLFILE/README
- lib/molfile/README
- *dump molfile*

---

**6.3.58 USER-NETCDF package**

**Contents:**

Dump styles for writing NetCDF formatted dump files. NetCDF is a portable, binary, self-describing file format developed on top of HDF5. The file contents follow the AMBER NetCDF trajectory conventions (http://ambermd.org/netcdf/nctraj.xhtml), but include extensions.

To use this package you must have the NetCDF library available on your system.

Note that NetCDF files can be directly visualized with the following tools:

- *Ovito* (Ovito supports the AMBER convention and the extensions mentioned above)
- *VMD*

**Author:** Lars Pastewka (Karlsruhe Institute of Technology).

**Install:**

This package has *specific installation instructions* on the *Build extras* doc page.

**Supporting info:**

- src/USER-NETCDF: filenames -> commands
- src/USER-NETCDF/README
- lib/netcdf/README
- *dump netcdf*

---

**6.3.59 USER-OMP package**

**Contents:**

Hundreds of pair, fix, compute, bond, angle, dihedral, improper, and kspace styles which are altered to enable threading on many-core CPUs via OpenMP directives. All of them have an “omp” in their style name. The USER-OMP package page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the “-sf omp” or “-suffix omp” *command-line switches*. Also see the KOKKOS, OPT, and USER-INTEL packages, which have styles optimized for CPUs.

**Author:** Axel Kohlmeyer (Temple U).
Note: To enable multi-threading support the compile flag “-fopenmp” and the link flag “-fopenmp” (for GNU compilers, you have to look up the equivalent flags for other compilers) must be used to build LAMMPS. When using Intel compilers, also the “-restrict” flag is required. The USER-OMP package can be compiled without enabling OpenMP; then all code will be compiled as serial and the only improvement over the regular styles are some data access optimization. These flags should be added to the CCFLAGS and LINKFLAGS lines of your Makefile.machine. See src/MAKE/OPTIONS/Makefile.omp for an example.

Once you have an appropriate Makefile.machine, you can install/un-install the package and build LAMMPS in the usual manner:

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/USER-OMP: filenames -> commands
- src/USER-OMP/README
- Accelerator packages
- USER-OMP package
- Section 2.6 -sf omp
- Section 2.6 -pk omp
- package omp
- Search the commands pages (fix, compute, pair, bond, angle, dihedral, improper, kspace) for styles followed by (o)
- Benchmarks page of web site

6.3.60 USER-PHONON package

Contents:
A fix phonon command that calculates dynamical matrices, which can then be used to compute phonon dispersion relations, directly from molecular dynamics simulations. And a dynamical_matrix as well as a third_order command to compute the dynamical matrix and third order tensor from finite differences.

Authors: Ling-Ti Kong (Shanghai Jiao Tong University) for “fix phonon” and Charlie Sievers (UC Davis) for “dynamical_matrix” and “third_order”

Supporting info:
- src/USER-PHONON: filenames -> commands
- src/USER-PHONON/README
- fix phonon
- dynamical_matrix
- third_order
- examples/USER/phonon
6.3.61 USER-PTM package

Contents:

A `compute ptm/atom` command that calculates local structure characterization using the Polyhedral Template Matching methodology.

Author: Peter Mahler Larsen (MIT).

Supporting info:

- `src/USER-PTM`: filenames not starting with ptm_ -> commands
- `src/USER-PTM`: filenames starting with ptm_ -> supporting code
- `src/USER-PTM/LICENSE`
- `compute ptm/atom`

6.3.62 USER-QMMM package

Contents:

A `fix qmmm` command which allows LAMMPS to be used as the MM code in a QM/MM simulation. This is currently only available in combination with the Quantum ESPRESSO package.

To use this package you must have Quantum ESPRESSO (QE) available on your system and include its coupling library in the compilation and then compile LAMMPS as a library. For QM/MM calculations you then build a custom binary with MPI support, that sets up 3 partitions with MPI sub-communicators (for inter- and intra-partition communication) and then calls the corresponding library interfaces on each partition (2x LAMMPS and 1x QE).

The current implementation supports an ONIOM style mechanical coupling and a multi-pole based electrostatic coupling to the Quantum ESPRESSO plane wave DFT package. The QM/MM interface has been written in a manner that coupling to other QM codes should be possible without changes to LAMMPS itself.

Authors: Axel Kohlmeyer (Temple U). Mariella Ippolito and Carlo Cavazzoni (CINECA, Italy)

Install:

This package has specific installation instructions on the Build extras doc page.

Supporting info:

- `src/USER-QMMM`: filenames -> commands
- `src/USER-QMMM/LICENSE`
- `lib/qmmm/LICENSE`
- `fix phonon`
- `lib/qmmm/example-ec/LICENSE`
- `lib/qmmm/example-mc/LICENSE`
6.3.63 USER-QTB package

Contents:
Two fixes which provide a self-consistent quantum treatment of vibrational modes in a classical molecular dynamics simulation. By coupling the MD simulation to a colored thermostat, it introduces zero point energy into the system, altering the energy power spectrum and the heat capacity to account for their quantum nature. This is useful when modeling systems at temperatures lower than their classical limits or when temperatures ramp across the classical limits in a simulation.

Author: Yuan Shen (Stanford U).

Supporting info:
- src/USER-QTB: filenames -> commands
- src/USER-QTB/README
- fix qtb
- fix qbmsst
- examples/USER/qtb

6.3.64 USER-QUIP package

Contents:
A pair_style quip command which wraps the QUIP libAtoms library, which includes a variety of interatomic potentials, including Gaussian Approximation Potential (GAP) models developed by the Cambridge University group.

To use this package you must have the QUIP libAtoms library available on your system.

Author: Albert Bartok (Cambridge University)

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/USER-QUIP: filenames -> commands
- src/USER-QUIP/README
- pair_style quip
- examples/USER/quip
6.3.65 USER-REACTION package

Contents:
This package allows for complex bond topology changes (reactions) during a running MD simulation, when using classical force fields. Topology changes are defined in pre- and post-reaction molecule templates and can include creation and deletion of bonds, angles, dihedrals, impropers, atom types, bond types, angle types, dihedral types, improper types, and/or atomic charges. Other options currently available include reaction constraints (e.g. angle and Arrhenius constraints), deletion of reaction byproducts or other small molecules, and chiral-sensitive reactions.

Author: Jacob R. Gissinger (CU Boulder) while at NASA Langley Research Center.

Supporting info:

* src/USER-REACTION: filenames -> commands
* src/USER-REACTION/README
* fix bond/react
* examples/USER/reaction
* 2017 LAMMPS Workshop
* 2019 LAMMPS Workshop
* reacter.org

6.3.66 USER-REAXC package

Contents:
A pair style which implements the ReaxFF potential in C/C++. ReaxFF is a universal reactive force field. See the src/USER-REAXC/README file for more info on differences between the two packages. Also two fixes for monitoring molecules as bonds are created and destroyed.

Author: Hasan Metin Aktulga (MSU) while at Purdue University.

Supporting info:

* src/USER-REAXC: filenames -> commands
* src/USER-REAXC/README
* pair_style reax/c
* fix reax/c/bonds
* fix reax/c/species
* examples/reax
6.3.67 USER-SCAFACOS package

Contents:
A KSpace style which wraps the ScaFaCoS Coulomb solver library to compute long-range Coulombic interactions. To use this package you must have the ScaFaCoS library available on your system.

Author: Rene Halver (JSC) wrote the scafacos LAMMPS command.

ScaFaCoS itself was developed by a consortium of German research facilities with a BMBF (German Ministry of Science and Education) funded project in 2009-2012. Participants of the consortium were the Universities of Bonn, Chemnitz, Stuttgart, and Wuppertal as well as the Forschungszentrum Juelich.

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/USER-SCAFACOS: filenames -> commands
- src/USER-SCAFACOS/README
- kspace_style scafacos
- kspace_modify
- examples/USER/scafacos

6.3.68 USER-SDPD package

Contents:
A pair style for smoothed dissipative particle dynamics (SDPD), which is an extension of smoothed particle hydrodynamics (SPH) to mesoscale where thermal fluctuations are important (see the USER-SPH package). Also two fixes for moving and rigid body integration of SPH/SDPD particles (particles of atom_style meso).

Author: Morteza Jalalvand (Institute for Advanced Studies in Basic Sciences, Iran).

Supporting info:
- src/USER-SDPD: filenames -> commands
- src/USER-SDPD/README
- pair_style sdpd/taitwater/isothermal
- fix meso/move
- fix rigid/meso
- examples/USER/sdpd
6.3.69 USER-SMD package

Contents:
An atom style, fixes, computes, and several pair styles which implements smoothed Mach dynamics (SMD) for solids, which is a model related to smoothed particle hydrodynamics (SPH) for liquids (see the USER-SPH package).

This package solves solids mechanics problems via a state of the art stabilized meshless method with hourglass control. It can specify hydrostatic interactions independently from material strength models, i.e. pressure and deviatoric stresses are separated. It provides many material models (Johnson-Cook, plasticity with hardening, Mie-Grueneisen, Polynomial EOS) and allows new material models to be added. It implements rigid boundary conditions (walls) which can be specified as surface geometries from *.STL files.

Author: Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:
- src/USER-SMD: filenames -> commands
- src/USER-SMD/README
- doc/PDF/SMD_LAMMPS_userguide.pdf
- examples/USER/smd
- https://lammps.sandia.gov/movies.html#smd

6.3.70 USER-SMTBQ package

Contents:
A pair style which implements a Second Moment Tight Binding model with QEq charge equilibration (SMTBQ) potential for the description of ionocovalent bonds in oxides.

Authors: Nicolas Salles, Emile Maras, Olivier Politano, and Robert Tetot (LAAS-CNRS, France).

Supporting info:

6.3.71 USER-SPH package

Contents:
An atom style, fixes, computes, and several pair styles which implements smoothed particle hydrodynamics (SPH) for liquids. See the related USER-SMD package package for smooth Mach dynamics (SMD) for solids.

This package contains ideal gas, Lennard-Jones equation of states, Tait, and full support for complete (i.e. internal-energy dependent) equations of state. It allows for plain or Monagham's XSPH integration of the equations of motion. It has options for density continuity or density summation to propagate the density field. It has set command options to set the internal energy and density of particles from the input script and allows the same quantities to be output with thermodynamic output or to dump files via the compute property/atom command.

Author: Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

- compute */tally
- examples/USER/tally

6.3.73 USER-UEF package

Contents:
A fix style for the integration of the equations of motion under extensional flow with proper boundary conditions, as well as several supporting compute styles and an output option.

Author: David Nicholson (MIT).

Supporting info:
- src/USER-UEF: filenames -> commands
6.3.74 USER-VTK package

Contents:
A `dump vtk` command which outputs snapshot info in the VTK format, enabling visualization by Paraview or other visualization packages.

To use this package you must have VTK library available on your system.

Authors: Richard Berger (JKU) and Daniel Queteschiner (DCS Computing).

Install:
This package has specific installation instructions on the Build extras doc page.

Supporting info:

CHAPTER
SEVEN

ACCELERATE PERFORMANCE

This section describes various methods for improving LAMMPS performance for different classes of problems running on different kinds of machines.

There are two thrusts to the discussion that follows. The first is using code options that implement alternate algorithms that can speed-up a simulation. The second is to use one of the several accelerator packages provided with LAMMPS that contain code optimized for certain kinds of hardware, including multi-core CPUs, GPUs, and Intel Xeon Phi co-processors.

The Benchmark page of the LAMMPS web site gives performance results for the various accelerator packages discussed on the Speed packages doc page, for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

7.1 Benchmarks

Current LAMMPS performance is discussed on the Benchmarks page of the LAMMPS website where timings and parallel efficiency are listed. The page has several sections, which are briefly described below:

- CPU performance on 5 standard problems, strong and weak scaling
- GPU and Xeon Phi performance on same and related problems
- Comparison of cost of interatomic potentials
- Performance of huge, billion-atom problems

The 5 standard problems are as follow:

1. LJ = atomic fluid, Lennard-Jones potential with 2.5 sigma cutoff (55 neighbors per atom), NVE integration
2. Chain = bead-spring polymer melt of 100-mer chains, FENE bonds and LJ pairwise interactions with a $2^{(1/6)}$ sigma cutoff (5 neighbors per atom), NVE integration
3. EAM = metallic solid, Cu EAM potential with 4.95 Angstrom cutoff (45 neighbors per atom), NVE integration
4. Chute = granular chute flow, frictional history potential with 1.1 sigma cutoff (7 neighbors per atom), NVE integration
5. Rhodo = rhodopsin protein in solvated lipid bilayer, CHARMM force field with a 10 Angstrom LJ cutoff (440 neighbors per atom), particle-particle particle-mesh (PPPM) for long-range Coulombics, NPT integration

Input files for these 5 problems are provided in the bench directory of the LAMMPS distribution. Each has 32,000 atoms and runs for 100 timesteps. The size of the problem (number of atoms) can be varied using command-line switches as described in the bench/README file. This is an easy way to test performance and either strong or weak scalability on your machine.
The bench directory includes a few log.* files that show performance of these 5 problems on 1 or 4 cores of Linux desktop. The bench/FERMI and bench/KEPLER directories have input files and scripts and instructions for running the same (or similar) problems using OpenMP or GPU or Xeon Phi acceleration options. See the README files in those directories and the Accelerator packages pages for instructions on how to build LAMMPS and run on that kind of hardware.

The bench/POTENTIALS directory has input files which correspond to the table of results on the Potentials section of the Benchmarks web page. So you can also run those test problems on your machine.

The billion-atom section of the Benchmarks web page has performance data for very large benchmark runs of simple Lennard-Jones (LJ) models, which use the bench/in.lj input script.

For all the benchmarks, a useful metric is the CPU cost per atom per timestep. Since performance scales roughly linearly with problem size and timesteps for all LAMMPS models (i.e. interatomic or coarse-grained potentials), the run time of any problem using the same model (atom style, force field, cutoff, etc) can then be estimated.

Performance on a parallel machine can also be predicted from one-core or one-node timings if the parallel efficiency can be estimated. The communication bandwidth and latency of a particular parallel machine affects the efficiency. On most machines LAMMPS will give a parallel efficiency on these benchmarks above 50% so long as the number of atoms/core is a few 100 or greater, and closer to 100% for large numbers of atoms/core. This is for all-MPI mode with one MPI task per core. For nodes with accelerator options or hardware (OpenMP, GPU, Phi), you should first measure single node performance. Then you can estimate parallel performance for multi-node runs using the same logic as for all-MPI mode, except that now you will typically need many more atoms/node to achieve good scalability.

### 7.2 Measuring performance

Before trying to make your simulation run faster, you should understand how it currently performs and where the bottlenecks are.

The best way to do this is run the your system (actual number of atoms) for a modest number of timesteps (say 100 steps) on several different processor counts, including a single processor if possible. Do this for an equilibrium version of your system, so that the 100-step timings are representative of a much longer run. There is typically no need to run for 1000s of timesteps to get accurate timings; you can simply extrapolate from short runs.

For the set of runs, look at the timing data printed to the screen and log file at the end of each LAMMPS run. The screen and logfile output page gives an overview.

Running on one (or a few processors) should give a good estimate of the serial performance and what portions of the timestep are taking the most time. Running the same problem on a few different processor counts should give an estimate of parallel scalability. I.e. if the simulation runs 16x faster on 16 processors, its 100% parallel efficient; if it runs 8x faster on 16 processors, it’s 50% efficient.

The most important data to look at in the timing info is the timing breakdown and relative percentages. For example, trying different options for speeding up the long-range solvers will have little impact if they only consume 10% of the run time. If the pairwise time is dominating, you may want to look at GPU or OMP versions of the pair style, as discussed below. Comparing how the percentages change as you increase the processor count gives you a sense of how different operations within the timestep are scaling. Note that if you are running with a Kspace solver, there is additional output on the breakdown of the Kspace time. For PPPM, this includes the fraction spent on FFTs, which can be communication intensive.

Another important detail in the timing info are the histograms of atoms counts and neighbor counts. If these vary widely across processors, you have a load-imbalance issue. This often results in inaccurate relative timing data, because processors have to wait when communication occurs for other processors to catch up. Thus the reported times for “Communication” or “Other” may be higher than they really are, due to load-imbalance. If this is an issue, you can uncomment the MPI_Barrier() lines in src/timer.cpp, and re-compile LAMMPS, to obtain synchronized timings.
7.3 General tips

Note: this page is still a work in progress

Here is a list of general ideas for improving simulation performance. Most of them are only applicable to certain models and certain bottlenecks in the current performance, so let the timing data you generate be your guide. It is hard, if not impossible, to predict how much difference these options will make, since it is a function of problem size, number of processors used, and your machine. There is no substitute for identifying performance bottlenecks, and trying out various options.

- rRESPA
- Two-FFT PPPM
- Staggered PPPM
- single vs double PPPM
- partial charge PPPM
- verlet/split run style
- processor command for proc layout and numa layout
- load-balancing: balance and fix balance

Two-FFT PPPM, also called analytic differentiation or ad PPPM, uses 2 FFTs instead of the 4 FFTs used by the default ik differentiation PPPM. However, 2-FFT PPPM also requires a slightly larger mesh size to achieve the same accuracy as 4-FFT PPPM. For problems where the FFT cost is the performance bottleneck (typically large problems running on many processors), 2-FFT PPPM may be faster than 4-FFT PPPM.

Staggered PPPM performs calculations using two different meshes, one shifted slightly with respect to the other. This can reduce force aliasing errors and increase the accuracy of the method, but also doubles the amount of work required. For high relative accuracy, using staggered PPPM allows one to half the mesh size in each dimension as compared to regular PPPM, which can give around a 4x speedup in the kspace time. However, for low relative accuracy, using staggered PPPM gives little benefit and can be up to 2x slower in the kspace time. For example, the rhodopsin benchmark was run on a single processor, and results for kspace time vs. relative accuracy for the different methods are shown in the figure below. For this system, staggered PPPM (using ik differentiation) becomes useful when using a relative accuracy of slightly greater than 1e-5 and above.
7.4 Accelerator packages

Accelerated versions of various pair_style, fixes, computes, and other commands have been added to LAMMPS, which will typically run faster than the standard non-accelerated versions. Some require appropriate hardware to be present on your system, e.g. GPUs or Intel Xeon Phi co-processors.

All of these commands are in packages provided with LAMMPS. An overview of packages is give on the Packages doc pages.

These are the accelerator packages currently in LAMMPS, either as standard or user packages:

</table>
7.4.1 GPU package

The GPU package was developed by Mike Brown while at SNL and ORNL and his collaborators, particularly Trung Nguyen (now at Northwestern). It provides GPU versions of many pair styles and for parts of the kspace_style pppm for long-range Coulombics. It has the following general features:

- It is designed to exploit common GPU hardware configurations where one or more GPUs are coupled to many cores of one or more multi-core CPUs, e.g. within a node of a parallel machine.
- Atom-based data (e.g. coordinates, forces) are moved back-and-forth between the CPU(s) and GPU every timestep.
- Neighbor lists can be built on the CPU or on the GPU.
- The charge assignment and force interpolation portions of PPPM can be run on the GPU. The FFT portion, which requires MPI communication between processors, runs on the CPU.
- Force computations of different style (pair vs. bond/angle/dihedral/improper) can be performed concurrently on the GPU and CPU(s), respectively.
- It allows for GPU computations to be performed in single or double precision, or in mixed-mode precision, where pairwise forces are computed in single precision, but accumulated into double-precision force vectors.
- LAMMPS-specific code is in the GPU package. It makes calls to a generic GPU library in the lib/gpu directory. This library provides NVIDIA support as well as more general OpenCL support, so that the same functionality is supported on a variety of hardware.

Required hardware/software:

To compile and use this package in CUDA mode, you currently need to have an NVIDIA GPU and install the corresponding NVIDIA CUDA toolkit software on your system (this is primarily tested on Linux and completely unsupported on Windows):

- Check if you have an NVIDIA GPU: `cat /proc/driver/nvidia/gpus/*/information`
- Go to http://www.nvidia.com/object/cuda_get.html
- Install a driver and toolkit appropriate for your system (SDK is not necessary)
- Run `lammps/lib/gpu/nvc_get_devices` (after building the GPU library, see below) to list supported devices and properties

To compile and use this package in OpenCL mode, you currently need to have the OpenCL headers and the (vendor neutral) OpenCL library installed. In OpenCL mode, the acceleration depends on having an OpenCL Installable Client Driver (ICD) installed. There can be multiple of them for the same or different hardware (GPUs, CPUs, Accelerators) installed at the same time. OpenCL refers to those as ‘platforms’. The GPU library will select the first suitable platform, but this can be overridden using the device option of the `package` command. run `lammps/lib/gpu/ocl_get_devices` to get a list of available platforms and devices with a suitable ICD available.

To compute and use this package in HIP mode, you have to have the AMD ROCm software installed. Versions of ROCm older than 3.5 are currently deprecated by AMD.

Building LAMMPS with the GPU package:

See the Build extras doc page for instructions.

Run with the GPU package from the command line:

The mpirun or mpiexec command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the mpirun command in MPICH does this via its `-np` and `-ppn` switches. Ditto for OpenMPI via `-np` and `-npernode`.

When using the GPU package, you cannot assign more than one GPU to a single MPI task. However multiple MPI tasks can share the same GPU, and in many cases it will be more efficient to run this way. Likewise it may be more
efficient to use less MPI tasks/node than the available # of CPU cores. Assignment of multiple MPI tasks to a GPU will happen automatically if you create more MPI tasks/node than there are GPUs/mode. E.g. with 8 MPI tasks/node and 2 GPUs, each GPU will be shared by 4 MPI tasks.

Use the “-sf gpu” command-line switch, which will automatically append “gpu” to styles that support it. Use the “-pk gpu Ng” command-line switch to set Ng = # of GPUs/node to use.

```
lmp_machine -sf gpu -pk gpu 1 -in in.script                 # 1 MPI task uses 1 GPU
mpirun -np 12 lmp_machine -sf gpu -pk gpu 2 -in in.script   # 12 MPI tasks share 2 GPUs on a single 16-core (or whatever) node
mpirun -np 48 -ppn 12 lmp_machine -sf gpu -pk gpu 2 -in in.script # ditto on 4 16-core nodes
```

Note that if the “-sf gpu” switch is used, it also issues a default `package gpu 1` command, which sets the number of GPUs/node to 1.

Using the “-pk” switch explicitly allows for setting of the number of GPUs/node to use and additional options. Its syntax is the same as the “package gpu” command. See the package command doc page for details, including the default values used for all its options if it is not specified.

Note that the default for the `package gpu` command is to set the Newton flag to “off” pairwise interactions. It does not affect the setting for bonded interactions (LAMMPS default is “on”). The “off” setting for pairwise interaction is currently required for GPU package pair styles.

**Or run with the GPU package by editing an input script:**

The discussion above for the `mpirun/mpiexec` command, MPI tasks/node, and use of multiple MPI tasks/GPU is the same.

Use the `suffix gpu` command, or you can explicitly add an “gpu” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/gpu 2.5
```

You must also use the `package gpu` command to enable the GPU package, unless the “-sf gpu” or “-pk gpu” command-line switches were used. It specifies the number of GPUs/node to use, as well as other options.

**Speed-ups to expect:**

The performance of a GPU versus a multi-core CPU is a function of your hardware, which pair style is used, the number of atoms/GPU, and the precision used on the GPU (double, single, mixed). Using the GPU package in OpenCL mode on CPUs (which uses vectorization and multithreading) is usually resulting in inferior performance compared to using LAMMPS’ native threading and vectorization support in the USER-OMP and USER-INTEL packages.

See the Benchmark page of the LAMMPS web site for performance of the GPU package on various hardware, including the Titan HPC platform at ORNL.

You should also experiment with how many MPI tasks per GPU to use to give the best performance for your problem and machine. This is also a function of the problem size and the pair style being used. Likewise, you should experiment with the precision setting for the GPU library to see if single or mixed precision will give accurate results, since they will typically be faster.

**Guidelines for best performance:**

- Using multiple MPI tasks per GPU will often give the best performance, as allowed my most multi-core CPU/GPU configurations.
- If the number of particles per MPI task is small (e.g. 100s of particles), it can be more efficient to run with fewer MPI tasks per GPU, even if you do not use all the cores on the compute node.
• The `package gpu` command has several options for tuning performance. Neighbor lists can be built on the GPU or CPU. Force calculations can be dynamically balanced across the CPU cores and GPUs. GPU-specific settings can be made which can be optimized for different hardware. See the `package` command doc page for details.

• As described by the `package gpu` command, GPU accelerated pair styles can perform computations asynchronously with CPU computations. The “Pair” time reported by LAMMPS will be the maximum of the time required to complete the CPU pair style computations and the time required to complete the GPU pair style computations. Any time spent for GPU-enabled pair styles for computations that run simultaneously with `bond`, `angle`, `dihedral`, `improper`, and `long-range` calculations will not be included in the “Pair” time.

• When the `mode` setting for the package gpu command is force/neigh, the time for neighbor list calculations on the GPU will be added into the “Pair” time, not the “Neigh” time. An additional breakdown of the times required for various tasks on the GPU (data copy, neighbor calculations, force computations, etc) are output only with the LAMMPS screen output (not in the log file) at the end of each run. These timings represent total time spent on the GPU for each routine, regardless of asynchronous CPU calculations.

• The output section “GPU Time Info (average)” reports “Max Mem / Proc”. This is the maximum memory used at one time on the GPU for data storage by a single MPI process.

Restrictions

None.

7.4.2 USER-INTEL package

The USER-INTEL package is maintained by Mike Brown at Intel Corporation. It provides two methods for accelerating simulations, depending on the hardware you have. The first is acceleration on Intel CPUs by running in single, mixed, or double precision with vectorization. The second is acceleration on Intel Xeon Phi co-processors via offloading neighbor list and non-bonded force calculations to the Phi. The same C++ code is used in both cases. When offloading to a co-processor from a CPU, the same routine is run twice, once on the CPU and once with an offload flag. This allows LAMMPS to run on the CPU cores and co-processor cores simultaneously.

Currently Available USER-INTEL Styles

• Angle Styles: charmm, harmonic
• Bond Styles: fene, fourier, harmonic
• Dihedral Styles: charmm, fourier, harmonic, opls
• Fixes: nve, npt, nvt, nvt/sllod, nve/asphere
• Improper Styles: cvff, harmonic
• Pair Styles: airebo, airebo/morse, buck/coul/cut, buck/coul/long, buck, dpd, eam, eam/alloy, eam/fs, gayberne, lj/charmm/coul/charmm, lj/charmm/coul/long, lj/cut, lj/cut/coul/long, lj/long/coul/long, rebo, sw, tersoff
• K-Space Styles: ppm, ppm/disp

Warning: None of the styles in the USER-INTEL package currently support computing per-atom stress. If any compute or fix in your input requires it, LAMMPS will abort with an error message.
Speed-up to expect

The speedup will depend on your simulation, the hardware, which styles are used, the number of atoms, and the floating-point precision mode. Performance improvements are shown compared to LAMMPS without using other acceleration packages as these are under active development (and subject to performance changes). The measurements were performed using the input files available in the src/USER-INTEL/TEST directory with the provided run script. These are scalable in size; the results given are with 512K particles (524K for Liquid Crystal). Most of the simulations are standard LAMMPS benchmarks (indicated by the filename extension in parenthesis) with modifications to the run length and to add a warm-up run (for use with offload benchmarks).

Results are speedups obtained on Intel Xeon E5-2697v4 processors (code-named Broadwell), Intel Xeon Phi 7250 processors (code-named Knights Landing), and Intel Xeon Gold 6148 processors (code-named Skylake) with “June 2017” LAMMPS built with Intel Parallel Studio 2017 update 2. Results are with 1 MPI task per physical core. See src/USER-INTEL/TEST/README for the raw simulation rates and instructions to reproduce.

Accuracy and order of operations

In most molecular dynamics software, parallelization parameters (# of MPI, OpenMP, and vectorization) can change the results due to changing the order of operations with finite-precision calculations. The USER-INTEL package is deterministic. This means that the results should be reproducible from run to run with the same parallel configurations and when using deterministic libraries or library settings (MPI, OpenMP, FFT). However, there are differences in the USER-INTEL package that can change the order of operations compared to LAMMPS without acceleration:

- Neighbor lists can be created in a different order
- Bins used for sorting atoms can be oriented differently
- The default stencil order for PPPM is 7. By default, LAMMPS will calculate other PPPM parameters to fit the desired accuracy with this order
- The newton setting applies to all atoms, not just atoms shared between MPI tasks
- Vectorization can change the order for adding pairwise forces
• When using the -DLMP_USE_MKL_RNG define (all included intel optimized makefiles do) at build time, the random number generator for dissipative particle dynamics (pair style dpd/intel) uses the Mersenne Twister generator included in the Intel MKL library (that should be more robust than the default Masaglia random number generator)

The precision mode (described below) used with the USER-INTEL package can change the accuracy of the calculations. For the default mixed precision option, calculations between pairs or triplets of atoms are performed in single precision, intended to be within the inherent error of MD simulations. All accumulation is performed in double precision to prevent the error from growing with the number of atoms in the simulation. Single precision mode should not be used without appropriate validation.

Quick Start for Experienced Users

LAMMPS should be built with the USER-INTEL package installed. Simulations should be run with 1 MPI task per physical core, not hardware thread.

• Edit src/MAKE/OPTIONS/Makefile.intel_cpu_intelmpi as necessary.
• Set the environment variable KMP_BLOCKTIME=0
• “-pk intel 0 omp $t -sf intel” added to LAMMPS command-line
• $t should be 2 for Intel Xeon CPUs and 2 or 4 for Intel Xeon Phi
• For some of the simple 2-body potentials without long-range electrostatics, performance and scalability can be better with the “newton off” setting added to the input script
• For simulations on higher node counts, add “processors * * * grid numa” to the beginning of the input script for better scalability
• If using kspace_style pppm in the input script, add “kspace_modify diff ad” for better performance

For Intel Xeon Phi CPUs:

• Runs should be performed using MCDRAM.

For simulations using kspace_style pppm on Intel CPUs supporting AVX-512:

• Add “kspace_modify diff ad” to the input script
• The command-line option should be changed to “-pk intel 0 omp $r lrt yes -sf intel” where $r is the number of threads minus 1.
• Do not use thread affinity (set KMP_AFFINITY=none)
• The “newton off” setting may provide better scalability

For Intel Xeon Phi co-processors (Offload):

• Edit src/MAKE/OPTIONS/Makefile.intel_co-processor as necessary
• “-pk intel N omp 1” added to command-line where N is the number of co-processors per node.
**Required hardware/software**

When using Intel compilers version 16.0 or later is required.

In order to use offload to co-processors, an Intel Xeon Phi co-processor and an Intel compiler are required.

Although any compiler can be used with the USER-INTEL package, currently, vectorization directives are disabled by default when not using Intel compilers due to lack of standard support and observations of decreased performance. The OpenMP standard now supports directives for vectorization and we plan to transition the code to this standard once it is available in most compilers. We expect this to allow improved performance and support with other compilers.

For Intel Xeon Phi x200 series processors (code-named Knights Landing), there are multiple configuration options for the hardware. For best performance, we recommend that the MCDRAM is configured in “Flat” mode and with the cluster mode set to “Quadrant” or “SNC4”. “Cache” mode can also be used, although the performance might be slightly lower.

**Notes about Simultaneous Multithreading**

Modern CPUs often support Simultaneous Multithreading (SMT). On Intel processors, this is called Hyper-Threading (HT) technology. SMT is hardware support for running multiple threads efficiently on a single core. Hardware threads or logical cores are often used to refer to the number of threads that are supported in hardware. For example, the Intel Xeon E5-2697v4 processor is described as having 36 cores and 72 threads. This means that 36 MPI processes or OpenMP threads can run simultaneously on separate cores, but that up to 72 MPI processes or OpenMP threads can be running on the CPU without costly operating system context switches.

Molecular dynamics simulations will often run faster when making use of SMT. If a thread becomes stalled, for example because it is waiting on data that has not yet arrived from memory, another thread can start running so that the CPU pipeline is still being used efficiently. Although benefits can be seen by launching a MPI task for every hardware thread, for multinode simulations, we recommend that OpenMP threads are used for SMT instead, either with the USER-INTEL package, USER-OMP package, or KOKKOS package. In the example above, up to 36X speedups can be observed by using all 36 physical cores with LAMMPS. By using all 72 hardware threads, an additional 10-30% performance gain can be achieved.

The BIOS on many platforms allows SMT to be disabled, however, we do not recommend this on modern processors as there is little to no benefit for any software package in most cases. The operating system will report every hardware thread as a separate core allowing one to determine the number of hardware threads available. On Linux systems, this information can normally be obtained with:

```
cat /proc/cpuinfo
```

**Building LAMMPS with the USER-INTEL package**

See the Build extras doc page for instructions. Some additional details are covered here.

For building with make, several example Makefiles for building with the Intel compiler are included with LAMMPS in the src/MAKE/OPTIONS/ directory:

```plaintext
Makefile.intel_cpu_intelmpi # Intel Compiler, Intel MPI, No Offload
Makefile.knl # Intel Compiler, Intel MPI, No Offload
Makefile.intel_cpu_mpich # Intel Compiler, MPICH, No Offload
Makefile.intel_cpu_openpmi # Intel Compiler, OpenMPI, No Offload
Makefile.intel_co-processor # Intel Compiler, Intel MPI, Offload
```

Makefile.knl is identical to Makefile.intel_cpu_intelmpi except that it explicitly specifies that vectorization should be for Intel Xeon Phi x200 processors making it easier to cross-compile. For users with recent installations of Intel Parallel Studio, the process can be as simple as:
Note that if you build with support for a Phi co-processor, the same binary can be used on nodes with or without co-processors installed. However, if you do not have co-processors on your system, building without offload support will produce a smaller binary.

The general requirements for Makefiles with the USER-INTEL package are as follows. When using Intel compilers, “-restrict” is required and “-qopenmp” is highly recommended for CCFLAGS and LINKFLAGS. CCFLAGS should include “-DLMP_INTEL_USELRT” (unless POSIX Threads are not supported in the build environment) and “-DLMP_USE_MKL_RNG” (unless Intel Math Kernel Library (MKL) is not available in the build environment). For Intel compilers, LIB should include “-ltbbmalloc” or if the library is not available, “-DLMP_INTEL_NO_TBB” can be added to CCFLAGS. For builds supporting offload, “-DLMP_INTEL_OFFLOAD” is required for CCFLAGS and “-qoffload” is required for LINKFLAGS. Other recommended CCFLAG options for best performance are “-O2 -fno-alias -ansi-alias -qoverride-limits fp-model fast=2 -no-prec-div”.

**Note:** See the src/USER-INTEL/README file for additional flags that might be needed for best performance on Intel server processors code-named “Skylake”.

**Note:** The vectorization and math capabilities can differ depending on the CPU. For Intel compilers, the “-x” flag specifies the type of processor for which to optimize. “-xHost” specifies that the compiler should build for the processor used for compiling. For Intel Xeon Phi x200 series processors, this option is “-xMIC-AVX512”. For fourth generation Intel Xeon (v4/Broadwell) processors, “-xCORE-AVX2” should be used. For older Intel Xeon processors, “-xAVX” will perform best in general for the different simulations in LAMMPS. The default in most of the example Makefiles is to use “-xHost”, however this should not be used when cross-compiling.

### Running LAMMPS with the USER-INTEL package

Running LAMMPS with the USER-INTEL package is similar to normal use with the exceptions that one should 1) specify that LAMMPS should use the USER-INTEL package, 2) specify the number of OpenMP threads, and 3) optionally specify the specific LAMMPS styles that should use the USER-INTEL package. 1) and 2) can be performed from the command-line or by editing the input script. 3) requires editing the input script. Advanced performance tuning options are also described below to get the best performance.

When running on a single node (including runs using offload to a co-processor), best performance is normally obtained by using 1 MPI task per physical core and additional OpenMP threads with SMT. For Intel Xeon processors, 2 OpenMP threads should be used for SMT. For Intel Xeon Phi CPUs, 2 or 4 OpenMP threads should be used (best choice depends on the simulation). In cases where the user specifies that LRT mode is used (described below), 1 or 3 OpenMP threads should be used. For multi-node runs, using 1 MPI task per physical core will often perform best, however, depending on the machine and scale, users might get better performance by decreasing the number of MPI tasks and using more OpenMP threads. For performance, the product of the number of MPI tasks and OpenMP threads should not exceed the number of available hardware threads in almost all cases.

**Note:** Setting core affinity is often used to pin MPI tasks and OpenMP threads to a core or group of cores so that memory access can be uniform. Unless disabled at build time, affinity for MPI tasks and OpenMP threads on the host (CPU) will be set by default on the host when using offload to a co-processor. In this case, it is unnecessary to use other methods to control affinity (e.g. taskset, numactl, I_MPI_PIN_DOMAIN, etc.). This can be disabled with the no_affinity option to the package intel command or by disabling the option at build time (by adding
LAMMPS Documentation

-DINTEL_OFFLOAD_NOAFFINITY to the CCFLAGS line of your Makefile). Disabling this option is not recommended, especially when running on a machine with Intel Hyper-Threading technology disabled.

Run with the USER-INTEL package from the command line

To enable USER-INTEL optimizations for all available styles used in the input script, the “-sf intel” command-line switch can be used without any requirement for editing the input script. This switch will automatically append “intel” to styles that support it. It also invokes a default command: package intel 1. This package command is used to set options for the USER-INTEL package. The default package command will specify that USER-INTEL calculations are performed in mixed precision, that the number of OpenMP threads is specified by the OMP_NUM_THREADS environment variable, and that if co-processors are present and the binary was built with offload support, that 1 co-processor per node will be used with automatic balancing of work between the CPU and the co-processor.

You can specify different options for the USER-INTEL package by using the “-pk intel Nphi” command-line switch with keyword/value pairs as specified in the documentation. Here, Nphi = # of Xeon Phi co-processors/node (ignored without offload support). Common options to the USER-INTEL package include omp to override any OMP_NUM_THREADS setting and specify the number of OpenMP threads, mode to set the floating-point precision mode, and lrt to enable Long-Range Thread mode as described below. See the package intel command for details, including the default values used for all its options if not specified, and how to set the number of OpenMP threads via the OMP_NUM_THREADS environment variable if desired.

Examples (see documentation for your MPI/Machine for differences in launching MPI applications):

```
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script
# 2 nodes, 36 MPI tasks/node, $OMP_NUM_THREADS OpenMP Threads
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script -pk intel 0 omp 2 mode double
# Don't use any co-processors that might be available, use 2 OpenMP threads for each task, use double precision
```

Or run with the USER-INTEL package by editing an input script

As an alternative to adding command-line arguments, the input script can be edited to enable the USER-INTEL package. This requires adding the package intel command to the top of the input script. For the second example above, this would be:

```
package intel 0 omp 2 mode double
```

To enable the USER-INTEL package only for individual styles, you can add an “intel” suffix to the individual style, e.g.:

```
pair_style lj/cut/intel 2.5
```

Alternatively, the suffix intel command can be added to the input script to enable USER-INTEL styles for the commands that follow in the input script.
Tuning for Performance

**Note:** The USER-INTEL package will perform better with modifications to the input script when PPPM is used: `kspace_modify diff ad` should be added to the input script.

Long-Range Thread (LRT) mode is an option to the `package intel` command that can improve performance when using PPPM for long-range electrostatics on processors with SMT. It generates an extra pthread for each MPI task. The thread is dedicated to performing some of the PPPM calculations and MPI communications. This feature requires setting the pre-processor flag `-DLMP_INTEL_USELRT` in the makefile when compiling LAMMPS. It is unset in the default makefiles (`Makefile.mpi` and `Makefile.serial`) but is set in all makefiles tuned for the USER-INTEL package.

On Intel Xeon Phi x200 series CPUs, the LRT feature will likely improve performance, even on a single node. On Intel Xeon processors, using this mode might result in better performance when using multiple nodes, depending on the specific machine configuration. To enable LRT mode, specify that the number of OpenMP threads is one less than would normally be used for the run and add the “lrt yes” option to the “-pk” command-line suffix or “package intel” command. For example, if a run would normally perform best with “-pk intel 0 omp 4”, instead use “-pk intel 0 omp 3 lrt yes”. When using LRT, you should set the environment variable “KMP_AFFINITY=none”. LRT mode is not supported when using offload.

**Note:** Changing the `newton` setting to off can improve performance and/or scalability for simple 2-body potentials such as lj/cut or when using LRT mode on processors supporting AVX-512.

Not all styles are supported in the USER-INTEL package. You can mix the USER-INTEL package with styles from the `OPT` package or the `USER-OMP package`. Of course, this requires that these packages were installed at build time. This can performed automatically by using “-sf hybrid intel opt” or “-sf hybrid intel omp” command-line options. Alternatively, the “opt” and “omp” suffixes can be appended manually in the input script. For the latter, the `package omp` command must be in the input script or the “-pk omp Nt” command-line switch must be used where Nt is the number of OpenMP threads. The number of OpenMP threads should not be set differently for the different packages. Note that the `suffix hybrid intel omp` command can also be used within the input script to automatically append the “omp” suffix to styles when USER-INTEL styles are not available.

**Note:** For simulations on higher node counts, add `processors * * * grid numa` to the beginning of the input script for better scalability.

When running on many nodes, performance might be better when using fewer OpenMP threads and more MPI tasks. This will depend on the simulation and the machine. Using the `verlet/split` run style might also give better performance for simulations with PPPM electrostatics. Note that this is an alternative to LRT mode and the two cannot be used together.

Currently, when using Intel MPI with Intel Xeon Phi x200 series CPUs, better performance might be obtained by setting the environment variable “I_MPI_SHM_LMT=shm” for Linux kernels that do not yet have full support for AVX-512. Runs on Intel Xeon Phi x200 series processors will always perform better using MCDRAM. Please consult your system documentation for the best approach to specify that MPI runs are performed in MCDRAM.
Tuning for Offload Performance

The default settings for offload should give good performance.

When using LAMMPS with offload to Intel co-processors, best performance will typically be achieved with concurrent calculations performed on both the CPU and the co-processor. This is achieved by offloading only a fraction of the neighbor and pair computations to the co-processor or using hybrid pair styles where only one style uses the “intel” suffix. For simulations with long-range electrostatics or bond, angle, dihedral, improper calculations, computation and data transfer to the co-processor will run concurrently with computations and MPI communications for these calculations on the host CPU. This is illustrated in the figure below for the rhodopsin protein benchmark running on E5-2697v2 processors with a Intel Xeon Phi 7120p co-processor. In this plot, the vertical access is time and routines running at the same time are running concurrently on both the host and the co-processor.

![Diagram showing CPU and Co-processor activity over time](image)

The fraction of the offloaded work is controlled by the balance keyword in the package intel command. A balance of 0 runs all calculations on the CPU. A balance of 1 runs all supported calculations on the co-processor. A balance of 0.5 runs half of the calculations on the co-processor. Setting the balance to -1 (the default) will enable dynamic load balancing that continuously adjusts the fraction of offloaded work throughout the simulation. Because data transfer cannot be timed, this option typically produces results within 5 to 10 percent of the optimal fixed balance.

If running short benchmark runs with dynamic load balancing, adding a short warm-up run (10-20 steps) will allow the load-balancer to find a near-optimal setting that will carry over to additional runs.

The default for the package intel command is to have all the MPI tasks on a given compute node use a single Xeon Phi co-processor. In general, running with a large number of MPI tasks on each node will perform best with offload. Each MPI task will automatically get affinity to a subset of the hardware threads available on the co-processor. For example, if your card has 61 cores, with 60 cores available for offload and 4 hardware threads per core (240 total threads), running with 24 MPI tasks per node will cause each MPI task to use a subset of 10 threads on the co-processor. Fine tuning of the number of threads to use per MPI task or the number of threads to use per core can be accomplished with keyword settings of the package intel command.

The USER-INTEL package has two modes for deciding which atoms will be handled by the co-processor. This choice is controlled with the ghost keyword of the package intel command. When set to 0, ghost atoms (atoms at the borders between MPI tasks) are not offloaded to the card. This allows for overlap of MPI communication of forces with computation on the co-processor when the newton setting is “on”. The default is dependent on the style being used, however, better performance may be achieved by setting this option explicitly.

When using offload with CPU Hyper-Threading disabled, it may help performance to use fewer MPI tasks and...
OpenMP threads than available cores. This is due to the fact that additional threads are generated internally to handle the asynchronous offload tasks.

If pair computations are being offloaded to an Intel Xeon Phi co-processor, a diagnostic line is printed to the screen (not to the log file), during the setup phase of a run, indicating that offload mode is being used and indicating the number of co-processor threads per MPI task. Additionally, an offload timing summary is printed at the end of each run. When offloading, the frequency for \textit{atom sorting} is changed to 1 so that the per-atom data is effectively sorted at every rebuild of the neighbor lists. All the available co-processor threads on each Phi will be divided among MPI tasks, unless the \texttt{ptask} option of the \texttt{"-pk intel" command-line switch} is used to limit the co-processor threads per MPI task.

\textbf{Restrictions}

When offloading to a co-processor, \textit{hybrid} styles that require skip lists for neighbor builds cannot be offloaded. Using \texttt{hybrid/overlay} is allowed. Only one intel accelerated style may be used with hybrid styles when offloading. \textit{Special_bonds} exclusion lists are not currently supported with offload, however, the same effect can often be accomplished by setting cutoffs for excluded atom types to 0. None of the pair styles in the USER-INTEL package currently support the “inner”, “middle”, “outer” options for rRESPA integration via the \texttt{run_style respa} command; only the “pair” option is supported.

\subsection{7.4.3 KOKKOS package}

Kokkos is a templated C++ library that provides abstractions to allow a single implementation of an application kernel (e.g. a pair style) to run efficiently on different kinds of hardware, such as GPUs, Intel Xeon Phis, or many-core CPUs. Kokkos maps the C++ kernel onto different back end languages such as CUDA, OpenMP, or Pthreads. The Kokkos library also provides data abstractions to adjust (at compile time) the memory layout of data structures like 2d and 3d arrays to optimize performance on different hardware. For more information on Kokkos, see the Kokkos GitHub page.

The LAMMPS KOKKOS package contains versions of pair, fix, and atom styles that use data structures and macros provided by the Kokkos library, which is included with LAMMPS in /lib/kokkos. The KOKKOS package was developed primarily by Christian Trott (Sandia) and Stan Moore (Sandia) with contributions of various styles by others, including Sikandar Mashayak (UIUC), Ray Shan (Sandia), and Dan Ibanez (Sandia). For more information on developing using Kokkos abstractions see the Kokkos Wiki.

Kokkos currently provides support for 4 modes of execution (per MPI task). These are Serial (MPI-only for CPUs and Intel Phi), OpenMP (threading for many-core CPUs and Intel Phi), CUDA (for NVIDIA GPUs) and HIP (for AMD GPUs). You choose the mode at build time to produce an executable compatible with a specific hardware.

\textbf{NVIDIA CUDA support}

\section{7.4. Accelerator packages}
To build with Kokkos support for NVIDIA GPUs, the NVIDIA CUDA toolkit software version 9.0 or later must be installed on your system. See the discussion for the GPU package for details of how to check and do this.

CUDA and MPI library compatibility

Kokkos with CUDA currently implicitly assumes that the MPI library is CUDA-aware. This is not always the case, especially when using pre-compiled MPI libraries provided by a Linux distribution. This is not a problem when using only a single GPU with a single MPI rank. When running with multiple MPI ranks, you may see segmentation faults without CUDA-aware MPI support. These can be avoided by adding the flags `-pk kokkos cuda/aware off` to the LAMMPS command line or by using the command `package kokkos cuda/aware off` in the input file.

AMD GPU support

To build with Kokkos the HIPCC compiler from the AMD ROCm software version 3.5 or later is required. Supporting this Kokkos mode in LAMMPS is still work in progress. Please contact the LAMMPS developers if you run into problems.

Building LAMMPS with the KOKKOS package

See the Build extras doc page for instructions.

Running LAMMPS with the KOKKOS package

All Kokkos operations occur within the context of an individual MPI task running on a single node of the machine. The total number of MPI tasks used by LAMMPS (one or multiple per compute node) is set in the usual manner via the mpirun or mpiexec commands, and is independent of Kokkos. E.g. the mpirun command in OpenMPI does this via its `-np` and `-npernode` switches. Ditto for MPICH via `-np` and `-ppn`.

Running on a multi-core CPU

Here is a quick overview of how to use the KOKKOS package for CPU acceleration, assuming one or more 16-core nodes.

```
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk -in in.lj  # 1 node, 16 MPI tasks/node, no multi-threading
mpirun -np 2 -ppn 1 lmp_kokkos_omp -k on t 16 -sf kk -in in.lj  # 2 nodes, 1 MPI task/node, 16 threads/task
mpirun -np 2 lmp_kokkos_omp -k on t 8 -sf kk -in in.lj  # 1 node, 2 MPI tasks/node, 8 threads/task
mpirun -np 32 -ppn 4 lmp_kokkos_omp -k on t 4 -sf kk -in in.lj  # 8 nodes, 4 MPI tasks/node, 4 threads/task
```

To run using the KOKKOS package, use the “-k on”, “-sf kk” and “-pk kokkos” command-line switches in your mpirun command. You must use the “-k on” command-line switch to enable the KOKKOS package. It takes additional arguments for hardware settings appropriate to your system. For OpenMP use:

```
-k on t Nt
```

The “t Nt” option specifies how many OpenMP threads per MPI task to use with a node. The default is Nt = 1, which is MPI-only mode. Note that the product of MPI tasks * OpenMP threads/task should not exceed the physical number
of cores (on a node), otherwise performance will suffer. If Hyper-Threading (HT) is enabled, then the product of MPI tasks \* OpenMP threads/task should not exceed the physical number of cores \* hardware threads. The “-k on” switch also issues a “package kokkos” command (with no additional arguments) which sets various KOKKOS options to default values, as discussed on the package command doc page.

The “-sf kk” command-line switch will automatically append the “/kk” suffix to styles that support it. In this manner no modification to the input script is needed. Alternatively, one can run with the KOKKOS package by editing the input script as described below.

**Note:** When using a single OpenMP thread, the Kokkos Serial back end (i.e. Makefile.kokkos_mpi_only) will give better performance than the OpenMP back end (i.e. Makefile.kokkos_omp) because some of the overhead to make the code thread-safe is removed.

**Note:** Use the “-pk kokkos” command-line switch to change the default package kokkos options. See its doc page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```bash
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk -pk kokkos newton on neigh half comm
↪
→
no -in in.lj
# Newton on, Half neighbor list, non-threaded comm
```

If the newton command is used in the input script, it can also override the Newton flag defaults.

For half neighbor lists and OpenMP, the KOKKOS package uses data duplication (i.e. thread-private arrays) by default to avoid thread-level write conflicts in the force arrays (and other data structures as necessary). Data duplication is typically fastest for small numbers of threads (i.e. 8 or less) but does increase memory footprint and is not scalable to large numbers of threads. An alternative to data duplication is to use thread-level atomic operations which do not require data duplication. The use of atomic operations can be enforced by compiling LAMMPS with the “-DLMP_KOKKOS_USE_ATOMICS” pre-processor flag. Most but not all Kokkos-enabled pair_styles support data duplication. Alternatively, full neighbor lists avoid the need for duplication or atomic operations but require more compute operations per atom. When using the Kokkos Serial back end or the OpenMP back end with a single thread, no duplication or atomic operations are used. For CUDA and half neighbor lists, the KOKKOS package always uses atomic operations.

### CPU Cores, Sockets and Thread Affinity

When using multi-threading, it is important for performance to bind both MPI tasks to physical cores, and threads to physical cores, so they do not migrate during a simulation.

If you are not certain MPI tasks are being bound (check the defaults for your MPI installation), binding can be forced with these flags:

**OpenMPI 1.8:**

```bash
mpirun -np 2 --bind-to socket --map-by socket ./lmp_openmpi ...
```

**Mvapich2 2.0:**

```bash
mpiexec -np 2 --bind-to socket --map-by socket ./lmp_mvapich ...
```

For binding threads with KOKKOS OpenMP, use thread affinity environment variables to force binding. With OpenMP 3.1 (gcc 4.7 or later, intel 12 or later) setting the environment variable OMP_PROC_BIND=true should be sufficient. In general, for best performance with OpenMP 4.0 or later set OMP_PROC_BIND=spread and OMP_PLACES=threads. For binding threads with the KOKKOS pthreads option, compile LAMMPS with the hwloc or libnuma support enabled as described in the extra build options page.
Running on Knight’s Landing (KNL) Intel Xeon Phi

Here is a quick overview of how to use the KOKKOS package for the Intel Knight’s Landing (KNL) Xeon Phi:

KNL Intel Phi chips have 68 physical cores. Typically 1 to 4 cores are reserved for the OS, and only 64 or 66 cores are used. Each core has 4 Hyper-Threads, so there are effectively $N = 256$ (4*64) or $N = 264$ (4*66) cores to run on. The product of MPI tasks * OpenMP threads/task should not exceed this limit, otherwise performance will suffer. Note that with the KOKKOS package you do not need to specify how many KNLs there are per node; each KNL is simply treated as running some number of MPI tasks.

Examples of mpirun commands that follow these rules are shown below.

```plaintext
# Running on an Intel KNL node with 68 cores (272 threads/node via 4x hardware threading):
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj  # 1 node, 64 MPI tasks/ -node, 4 threads/task
mpirun -np 66 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj  # 1 node, 66 MPI tasks/ -node, 4 threads/task
mpirun -np 32 lmp_kokkos_phi -k on t 8 -sf kk -in in.lj  # 1 node, 32 MPI tasks/ -node, 8 threads/task
mpirun -np 512 -ppn 64 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj  # 8 nodes, 64 MPI tasks/node, 4 threads/task
```

The -np setting of the mpirun command sets the number of MPI tasks/node. The “-k on t Nt” command-line switch sets the number of threads/task as Nt. The product of these two values should be N, i.e. 256 or 264.

**Note:** The default for the package kokkos command when running on KNL is to use “half” neighbor lists and set the Newton flag to “on” for both pairwise and bonded interactions. This will typically be best for many-body potentials. For simpler pair-wise potentials, it may be faster to use a “full” neighbor list with Newton flag to “off”. Use the “-pk kokkos” command-line switch to change the default package kokkos options. See its doc page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```plaintext
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -pk kokkos comm host -in in.reax  # Newton on, half neighbor list, threaded comm
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -pk kokkos newton off neigh full comm, -no -in in.lj  # Newton off, full neighbor list, non-threaded comm
```

**Note:** MPI tasks and threads should be bound to cores as described above for CPUs.

**Note:** To build with Kokkos support for Intel Xeon Phi co-processors such as Knight’s Corner (KNC), your system must be configured to use them in “native” mode, not “offload” mode like the USER-INTEL package supports.
Running on GPUs

Use the “-k” command-line switch to specify the number of GPUs per node. Typically the -np setting of the mpirun command should set the number of MPI tasks/node to be equal to the number of physical GPUs on the node. You can assign multiple MPI tasks to the same GPU with the KOKKOS package, but this is usually only faster if some portions of the input script have not been ported to use Kokkos. In this case, also packing/unpacking communication buffers on the host may give speedup (see the KOKKOS package command). Using CUDA MPS is recommended in this scenario.

Using a CUDA-aware MPI library is highly recommended. CUDA-aware MPI use can be avoided by using -pk kokkos cuda/aware no. As above for multi-core CPUs (and no GPU), if N is the number of physical cores/node, then the number of MPI tasks/node should not exceed N.

-k on g Ng

Here are examples of how to use the KOKKOS package for GPUs, assuming one or more nodes, each with two GPUs:

mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj # 1 node, 2 MPI tasks/node, 2 GPUs/node

mpirun -np 32 -ppn 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj # 16 nodes, 2 MPI tasks/node, 2 GPUs/node (32 GPUs total)

Note: The default for the package kokkos command when running on GPUs is to use “full” neighbor lists and set the Newton flag to “off” for both pairwise and bonded interactions, along with threaded communication. When running on Maxwell or Kepler GPUs, this will typically be best. For Pascal GPUs and beyond, using “half” neighbor lists and setting the Newton flag to “on” may be faster. For many pair styles, setting the neighbor binsize equal to twice the CPU default value will give speedup, which is the default when running on GPUs. Use the “-pk kokkos” command-line switch to change the default package kokkos options. See its doc page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -pk kokkos newton on neigh half -binsize 2.8 -in in.lj # Newton on, half neighbor list, set binsize = neighbor ghost cutoff

Note: When using a GPU, you will achieve the best performance if your input script does not use fix or compute styles which are not yet Kokkos-enabled. This allows data to stay on the GPU for multiple timesteps, without being copied back to the host CPU. Invoking a non-Kokkos fix or compute, or performing I/O for thermo or dump output will cause data to be copied back to the CPU incurring a performance penalty.

Note: To get an accurate timing breakdown between time spend in pair, kspace, etc., you must set the environment variable CUDA_LAUNCH_BLOCKING=1. However, this will reduce performance and is not recommended for production runs.

7.4. Accelerator packages
Run with the KOKKOS package by editing an input script

Alternatively the effect of the “-sf” or “-pk” switches can be duplicated by adding the *package kokkos* or *suffix kk* commands to your input script.

The discussion above for building LAMMPS with the KOKKOS package, the mpirun/mpiexec command, and setting appropriate thread are the same.

You must still use the “-k on” *command-line switch* to enable the KOKKOS package, and specify its additional arguments for hardware options appropriate to your system, as documented above.

You can use the *suffix kk* command, or you can explicitly add a “kk” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/kk 2.5
```

You only need to use the *package kokkos* command if you wish to change any of its option defaults, as set by the “-k on” *command-line switch*.

Using OpenMP threading and CUDA together:

With the KOKKOS package, both OpenMP multi-threading and GPUs can be compiled and used together in a few special cases. In the makefile for the conventional build, the KOKKOS_DEVICES variable must include both, “Cuda” and “OpenMP”, as is the case for `/src/MAKE/OPTIONS/Makefile.kokkos_cuda_mpi`.

```
KOKKOS_DEVICES=Cuda,OpenMP
```

When building with CMake you need to enable both features as it is done in the `kokkos-cuda.cmake` CMake preset file.

```
cmake .. /cmake -DKokkos_ENABLE_CUDA=yes -DKokkos_ENABLE_OPENMP=yes
```

The suffix “/kk” is equivalent to “/kk/device”, and for Kokkos CUDA, using the “-sf kk” in the command line gives the default CUDA version everywhere. However, if the “/kk/host” suffix is added to a specific style in the input script, the Kokkos OpenMP (CPU) version of that specific style will be used instead. Set the number of OpenMP threads as “t Nt” and the number of GPUs as “g Ng”

```
-k on t Nt g Ng
```

For example, the command to run with 1 GPU and 8 OpenMP threads is then:

```
mpiexec -np 1 lmp_kokkos_cuda_openmpi -in in.lj -k on g 1 t 8 -sf kk
```

Conversely, if the “-sf kk/host” is used in the command line and then the “/kk” or “/kk/device” suffix is added to a specific style in your input script, then only that specific style will run on the GPU while everything else will run on the CPU in OpenMP mode. Note that the execution of the CPU and GPU styles will NOT overlap, except for a special case:

A kspace style and/or molecular topology (bonds, angles, etc.) running on the host CPU can overlap with a pair style running on the GPU. First compile with “-default-stream per-thread” added to CCFLAGS in the Kokkos CUDA Makefile. Then explicitly use the “/kk/host” suffix for kspace and bonds, angles, etc. in the input file and the “kk” suffix (equal to “kk/device”) on the command line. Also make sure the environment variable CUDA_LAUNCH_BLOCKING is not set to “1” so CPU/GPU overlap can occur.
Performance to expect

The performance of KOKKOS running in different modes is a function of your hardware, which KOKKOS-enable styles are used, and the problem size.

Generally speaking, the following rules of thumb apply:

- When running on CPUs only, with a single thread per MPI task, performance of a KOKKOS style is somewhere between the standard (un-accelerated) styles (MPI-only mode), and those provided by the USER-OMP package. However the difference between all 3 is small (less than 20%).
- When running on CPUs only, with multiple threads per MPI task, performance of a KOKKOS style is a bit slower than the USER-OMP package.
- When running large number of atoms per GPU, KOKKOS is typically faster than the GPU package when compiled for double precision. The benefit of using single or mixed precision with the GPU package depends significantly on the hardware in use and the simulated system and pair style.
- When running on Intel hardware, KOKKOS is not as fast as the USER-INTEL package, which is optimized for x86 hardware (not just from Intel) and compilation with the Intel compilers. The USER-INTEL package also can increase the vector length of vector instructions by switching to single or mixed precision mode.

See the Benchmark page of the LAMMPS web site for performance of the KOKKOS package on different hardware.

Advanced Kokkos options

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. They are explained on the KOKKOS section of the build extras doc page.

Restrictions

Currently, there are no precision options with the KOKKOS package. All compilation and computation is performed in double precision.

7.4.4 USER-OMP package

The USER-OMP package was developed by Axel Kohlmeyer at Temple University. It provides optimized and multi-threaded versions of many pair styles, nearly all bonded styles (bond, angle, dihedral, improper), several Kspace styles, and a few fix styles. It uses the OpenMP interface for multi-threading, but can also be compiled without OpenMP support, providing optimized serial styles in that case.

Required hardware/software

To enable multi-threading, your compiler must support the OpenMP interface. You should have one or more multi-core CPUs, as multiple threads can only be launched by each MPI task on the local node (using shared memory).
Building LAMMPS with the USER-OMP package

See the *Build extras* doc page for instructions.

Run with the USER-OMP package from the command line

These examples assume one or more 16-core nodes.

```
env OMP_NUM_THREADS=16 lmp_omp -sf omp -in in.script # 1 MPI task, 16 threads according to OMP_NUM_THREADS
lmp_mpi -sf omp -in in.script # 1 MPI task, no threads, optimized kernels
mpirun -np 4 lmp_omp -sf omp -pk omp 4 -in in.script # 4 MPI tasks, 4 threads/task
mpirun -np 32 -ppn 4 lmp_omp -sf omp -pk omp 4 -in in.script # 8 nodes, 4 MPI tasks/node, 4 threads/task
```

The mpirun or mpiexec command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the mpirun command in MPICH does this via its -np and -ppn switches. Ditto for OpenMPI via -np and -npernode.

You need to choose how many OpenMP threads per MPI task will be used by the USER-OMP package. Note that the product of MPI tasks * threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer.

As in the lines above, use the “-sf omp” *command-line switch*, which will automatically append “omp” to styles that support it. The “-sf omp” switch also issues a default `package omp 0` command, which will set the number of threads per MPI task via the OMP_NUM_THREADS environment variable.

You can also use the “-pk omp Nt” *command-line switch*, to explicitly set Nt = # of OpenMP threads per MPI task to use, as well as additional options. Its syntax is the same as the `package omp` command whose doc page gives details, including the default values used if it is not specified. It also gives more details on how to set the number of threads via the OMP_NUM_THREADS environment variable.

Or run with the USER-OMP package by editing an input script

The discussion above for the mpirun/mpiexec command, MPI tasks/node, and threads/MPI task is the same.

Use the `suffix omp` command, or you can explicitly add an “omp” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/omp 2.5
```

You must also use the `package omp` command to enable the USER-OMP package. When you do this you also specify how many threads per MPI task to use. The command doc page explains other options and how to set the number of threads via the OMP_NUM_THREADS environment variable.
Speed-up to expect

Depending on which styles are accelerated, you should look for a reduction in the “Pair time”, “Bond time”, “KSpace time”, and “Loop time” values printed at the end of a run.

You may see a small performance advantage (5 to 20%) when running a USER-OMP style (in serial or parallel) with a single thread per MPI task, versus running standard LAMMPS with its standard un-accelerated styles (in serial or all-MPI parallelization with 1 task/core). This is because many of the USER-OMP styles contain similar optimizations to those used in the OPT package, described in the OPT package doc page.

With multiple threads/task, the optimal choice of number of MPI tasks/node and OpenMP threads/task can vary a lot and should always be tested via benchmark runs for a specific simulation running on a specific machine, paying attention to guidelines discussed in the next sub-section.

A description of the multi-threading strategy used in the USER-OMP package and some performance examples are presented here.

Guidelines for best performance

For many problems on current generation CPUs, running the USER-OMP package with a single thread/task is faster than running with multiple threads/task. This is because the MPI parallelization in LAMMPS is often more efficient than multi-threading as implemented in the USER-OMP package. The parallel efficiency (in a threaded sense) also varies for different USER-OMP styles.

Using multiple threads/task can be more effective under the following circumstances:

- Individual compute nodes have a significant number of CPU cores but the CPU itself has limited memory bandwidth, e.g. for Intel Xeon 53xx (Clovertown) and 54xx (Harpertown) quad-core processors. Running one MPI task per CPU core will result in significant performance degradation, so that running with 4 or even only 2 MPI tasks per node is faster. Running in hybrid MPI+OpenMP mode will reduce the inter-node communication bandwidth contention in the same way, but offers an additional speedup by utilizing the otherwise idle CPU cores.

- The interconnect used for MPI communication does not provide sufficient bandwidth for a large number of MPI tasks per node. As in the aforementioned case, this effect worsens when using an increasing number of nodes.

- The system has a spatially inhomogeneous particle density which does not map well to the domain decomposition scheme or load-balancing options that LAMMPS provides. This is because multi-threading achieves parallelism over the number of particles, not via their distribution in space.

- A machine is being used in “capability mode”, i.e. near the point where MPI parallelism is maxed out. For example, this can happen when using the PPPM solver for long-range electrostatics on large numbers of nodes. The scaling of the KSpace calculation (see the kspace_style command) becomes the performance-limiting factor. Using multi-threading allows less MPI tasks to be invoked and can speed-up the long-range solver, while increasing overall performance by parallelizing the pairwise and bonded calculations via OpenMP. Likewise additional speedup can be sometimes be achieved by increasing the length of the Coulombic cutoff and thus reducing the work done by the long-range solver. Using the run_style verlet/split command, which is compatible with the USER-OMP package, is an alternative way to reduce the number of MPI tasks assigned to the KSpace calculation.

Additional performance tips are as follows:

- The best parallel efficiency from omp styles is typically achieved when there is at least one MPI task per physical CPU chip, i.e. socket or die.

- It is usually most efficient to restrict threading to a single socket, i.e. use one or more MPI task per socket.
• NOTE: By default, several current MPI implementations use a processor affinity setting that restricts each MPI task to a single CPU core. Using multi-threading in this mode will force all threads to share the one core and thus is likely to be counterproductive. Instead, binding MPI tasks to a (multi-core) socket, should solve this issue.

Restrictions

None.

7.4.5 OPT package

The OPT package was developed by James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technologies). It contains a handful of pair styles whose compute() methods were rewritten in C++ templated form to reduce the overhead due to if tests and other conditional code.

Required hardware/software

Any hardware. Any compiler.

Building LAMMPS with the OPT package

See the Build extras doc page for instructions.

Run with the OPT package from the command line

```bash
lmp_mpi -sf opt -in in.script   # run in serial
mpirun -np 4 lmp_mpi -sf opt -in in.script # run in parallel
```

Use the “-sf opt” command-line switch, which will automatically append “opt” to styles that support it.

Or run with the OPT package by editing an input script

Use the suffix opt command, or you can explicitly add an “opt” suffix to individual styles in your input script, e.g.

```plaintext
pair_style lj/cut/opt 2.5
```

Speed-up to expect

You should see a reduction in the “Pair time” value printed at the end of a run. On most machines for reasonable problem sizes, it will be a 5 to 20% savings.
Guidelines for best performance

Just try out an OPT pair style to see how it performs.

Restrictions

None.

Inverting this list, LAMMPS currently has acceleration support for three kinds of hardware, via the listed packages:

<table>
<thead>
<tr>
<th>Hardware Type</th>
<th>Packages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Many-core CPUs</td>
<td>USER-INTEL, KOKKOS, USER-OMP, OPT</td>
</tr>
<tr>
<td>NVIDIA GPUs</td>
<td>GPU, KOKKOS</td>
</tr>
<tr>
<td>Intel Phi</td>
<td>USER-INTEL, KOKKOS</td>
</tr>
</tbody>
</table>

Which package is fastest for your hardware may depend on the size problem you are running and what commands (accelerated and non-accelerated) are invoked by your input script. While these doc pages include performance guidelines, there is no substitute for trying out the different packages appropriate to your hardware.

Any accelerated style has the same name as the corresponding standard style, except that a suffix is appended. Otherwise, the syntax for the command that uses the style is identical, their functionality is the same, and the numerical results it produces should also be the same, except for precision and round-off effects.

For example, all of these styles are accelerated variants of the Lennard-Jones pair_style lj/cut:

- pair_style lj/cut/gpu
- pair_style lj/cut/intel
- pair_style lj/cut/kk
- pair_style lj/cut/omp
- pair_style lj/cut/opt

To see what accelerate styles are currently available for a particular style, find the style name in the Commands style pages (fix,compute,pair,etc) and see what suffixes are listed (g,i,k,o,t) with it. The doc pages for individual commands (e.g. pair lj/cut or fix nve) also list any accelerated variants available for that style.

To use an accelerator package in LAMMPS, and one or more of the styles it provides, follow these general steps. Details vary from package to package and are explained in the individual accelerator doc pages, listed above:

<table>
<thead>
<tr>
<th>Step Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>build the accelerator library</td>
<td>only for GPU package</td>
</tr>
<tr>
<td>install the accelerator package</td>
<td>make yes-opt, make yes-user-intel, etc</td>
</tr>
<tr>
<td>add compile/link flags to Makefile.mach in src/MAKE</td>
<td>only for USER-INTEL, KOKKOS, USER-OMP, OPT packages</td>
</tr>
<tr>
<td>re-build LAMMPS</td>
<td>make machine</td>
</tr>
<tr>
<td>prepare and test a regular LAMMPS simulation</td>
<td>lmp_machine -in in.script; mpirun -np 32 lmp_machine -in in.script</td>
</tr>
<tr>
<td>enable specific accelerator support via <code>-k on</code> command-line switch,</td>
<td>only needed for KOKKOS package</td>
</tr>
<tr>
<td>set any needed options for the package via “-pk” command-line switch or package command,</td>
<td>only if defaults need to be changed</td>
</tr>
<tr>
<td>use accelerated styles in your input via “-sf” command-line switch or suffix command</td>
<td>lmp_machine -in in.script -sf gpu</td>
</tr>
</tbody>
</table>
Note that the first 4 steps can be done as a single command with suitable make command invocations. This is discussed on the Packages doc pages, and its use is illustrated in the individual accelerator sections. Typically these steps only need to be done once, to create an executable that uses one or more accelerator packages.

The last 4 steps can all be done from the command-line when LAMMPS is launched, without changing your input script, as illustrated in the individual accelerator sections. Or you can add package and suffix commands to your input script.

Note: With a few exceptions, you can build a single LAMMPS executable with all its accelerator packages installed. Note however that the USER-INTEL and KOKKOS packages require you to choose one of their hardware options when building for a specific platform. I.e. CPU or Phi option for the USER-INTEL package. Or the OpenMP, Cuda, or Phi option for the KOKKOS package.

These are the exceptions. You cannot build a single executable with:

- both the USER-INTEL Phi and KOKKOS Phi options
- the USER-INTEL Phi or Kokkos Phi option, and the GPU package

See the examples/accelerate/README and make.list files for sample Make.py commands that build LAMMPS with any or all of the accelerator packages. As an example, here is a command that builds with all the GPU related packages installed (GPU, KOKKOS with Cuda), including settings to build the needed auxiliary GPU libraries for Kepler GPUs:

```
Make.py -j 16 -p omp gpu kokkos -cc nvcc wrap=mpi -gpu mode=double arch=35 -kokkos
  ↪
  → cuda arch=35 lib-all file mpi
```

The examples/accelerate directory also has input scripts that can be used with all of the accelerator packages. See its README file for details.

Likewise, the bench directory has FERMI and KEPLER and PHI sub-directories with Make.py commands and input scripts for using all the accelerator packages on various machines. See the README files in those directories.

As mentioned above, the Benchmark page of the LAMMPS web site gives performance results for the various accelerator packages for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

Here is a brief summary of what the various packages provide. Details are in the individual accelerator sections.

- Styles with a “gpu” suffix are part of the GPU package, and can be run on NVIDIA GPUs. The speed-up on a GPU depends on a variety of factors, discussed in the accelerator sections.

- Styles with an “intel” suffix are part of the USER-INTEL package. These styles support vectorized single and mixed precision calculations, in addition to full double precision. In extreme cases, this can provide speedups over 3.5x on CPUs. The package also supports acceleration in “offload” mode to Intel(R) Xeon Phi(TM) co-processors. This can result in additional speedup over 2x depending on the hardware configuration.

- Styles with a “kk” suffix are part of the KOKKOS package, and can be run using OpenMP on multicore CPUs, on an NVIDIA GPU, or on an Intel Xeon Phi in “native” mode. The speed-up depends on a variety of factors, as discussed on the KOKKOS accelerator page.

- Styles with an “omp” suffix are part of the USER-OMP package and allow a pair-style to be run in multi-threaded mode using OpenMP. This can be useful on nodes with high-core counts when using less MPI processes than cores is advantageous, e.g. when running with PPPM so that FFTs are run on fewer MPI processors or when the many MPI tasks would overload the available bandwidth for communication.

- Styles with an “opt” suffix are part of the OPT package and typically speed-up the pairwise calculations of your simulation by 5-25% on a CPU.

The individual accelerator package doc pages explain:
The next section compares and contrasts the various accelerator options, since there are multiple ways to perform OpenMP threading, run on GPUs, optimize for vector units on CPUs and run on Intel Xeon Phi (co-)processors.

All of these packages can accelerate a LAMMPS calculation taking advantage of hardware features, but they do it in different ways and acceleration is not always guaranteed.

As a consequence, for a particular simulation on specific hardware, one package may be faster than the other. We give some guidelines below, but the best way to determine which package is faster for your input script is to try multiple of them on your machine and experiment with available performance tuning settings. See the benchmarking section below for examples where this has been done.

Guidelines for using each package optimally:

- Both, the GPU and the KOKKOS package allows you to assign multiple MPI ranks (= CPU cores) to the same GPU. For the GPU package, this can lead to a speedup through better utilization of the GPU (by overlapping computation and data transfer) and more efficient computation of the non-GPU accelerated parts of LAMMPS through MPI parallelization, as all system data is maintained and updated on the host. For KOKKOS, there is less to no benefit from this, due to its different memory management model, which tries to retain data on the GPU.

- The GPU package moves per-atom data (coordinates, forces, and (optionally) neighbor list data, if not computed on the GPU) between the CPU and GPU at every timestep. The KOKKOS/CUDA package only does this on timesteps when a CPU calculation is required (e.g. to invoke a fix or compute that is non-GPU-ized). Hence, if you can formulate your input script to only use GPU-ized fixes and computes, and avoid doing I/O too often (thermo output, dump file snapshots, restart files), then the data transfer cost of the KOKKOS/CUDA package can be very low, causing it to run faster than the GPU package.

- The GPU package is often faster than the KOKKOS/CUDA package, when the number of atoms per GPU is on the smaller side. The crossover point, in terms of atoms/GPU at which the KOKKOS/CUDA package becomes faster depends strongly on the pair style. For example, for a simple Lennard Jones system the crossover (in single precision) is often about 50K-100K atoms per GPU. When performing double precision calculations the crossover point can be significantly smaller.

- Both KOKKOS and GPU package compute bonded interactions (bonds, angles, etc) on the CPU. If the GPU package is running with several MPI processes assigned to one GPU, the cost of computing the bonded interactions is spread across more CPUs and hence the GPU package can run faster in these cases.

- When using LAMMPS with multiple MPI ranks assigned to the same GPU, its performance depends to some extent on the available bandwidth between the CPUs and the GPU. This can differ significantly based on the available bus technology, capability of the host CPU and mainboard, the wiring of the buses and whether switches are used to increase the number of available bus slots, or if GPUs are housed in an external enclosure. This can become quite complex.
• To achieve significant acceleration through GPUs, both KOKKOS and GPU package require capable GPUs with fast on-device memory and efficient data transfer rates. This requests capable upper mid-level to high-end (desktop) GPUs. Using lower performance GPUs (e.g. on laptops) may result in a slowdown instead.

• For the GPU package, specifically when running in parallel with MPI, if it often more efficient to exclude the PPPM kspace style from GPU acceleration and instead run it - concurrently with a GPU accelerated pair style - on the CPU. This can often be easily achieved with placing a {suffix off} command before and a {suffix on} command after the {kspace_style pppm} command.

• The KOKKOS/OpenMP and USER-OMP package have different thread management strategies, which should result in USER-OMP being more efficient for a small number of threads with increasing overhead as the number of threads per MPI rank grows. The KOKKOS/OpenMP kernels have less overhead in that case, but have lower performance with few threads.

• The USER-INTEL package contains many options and settings for achieving additional performance on Intel hardware (CPU and accelerator cards), but to unlock this potential, an Intel compiler is required. The package code will compile with GNU gcc, but it will not be as efficient.

Differences between the GPU and KOKKOS packages:

• The GPU package accelerates only pair force, neighbor list, and (parts of) PPPM calculations. The KOKKOS package attempts to run most of the calculation on the GPU, but can transparently support non-accelerated code (with a performance penalty due to having data transfers between host and GPU).

• The GPU package requires neighbor lists to be built on the CPU when using exclusion lists, or a triclinic simulation box.

• The GPU package can be compiled for CUDA or OpenCL and thus supports both, NVIDIA and AMD GPUs well. On NVIDIA hardware, using CUDA is typically resulting in equal or better performance over OpenCL.

• OpenCL in the GPU package does theoretically also support Intel CPUs or Intel Xeon Phi, but the native support for those in KOKKOS (or USER-INTEL) is superior.
Chapter Eight

Howto Discussions

These doc pages describe how to perform various tasks with LAMMPS, both for users and developers. The glossary website page also lists MD terminology with links to corresponding LAMMPS manual pages. The example input scripts included in the examples directory of the LAMMPS distribution and highlighted on the Examples doc page also show how to setup and run various kinds of simulations.

8.1 Tutorials howto

8.1.1 Using CMake with LAMMPS tutorial

The support for building LAMMPS with CMake is a recent addition to LAMMPS thanks to the efforts of Christoph Junghans (LANL) and Richard Berger (Temple U). One of the key strengths of CMake is that it is not tied to a specific platform or build system and thus generate the files necessary to build and develop for different build systems and on different platforms. Note, that this applies to the build system itself not the LAMMPS code. In other words, without additional porting effort, it is not possible - for example - to compile LAMMPS with Visual C++ on Windows. The build system output can also include support files necessary to program LAMMPS as a project in integrated development environments (IDE) like Eclipse, Visual Studio, QtCreator, Xcode, CodeBlocks, Kate and others.

A second important feature of CMake is, that it can detect and validate available libraries, optimal settings, available support tools and so on, so that by default LAMMPS will take advantage of available tools without requiring to provide the details about how to enable/integrate them.

The downside of this approach is, that there is some complexity associated with running CMake itself and how to customize the building of LAMMPS. This tutorial will show how to manage this through some selected examples. Please see the chapter about building LAMMPS for descriptions of specific flags and options for LAMMPS in general and for specific packages.

CMake can be used through either the command-line interface (CLI) program cmake (or cmake3), a text mode interactive user interface (TUI) program ccmake (or ccmake3), or a graphical user interface (GUI) program cmake-gui. All of them are portable software available on all supported platforms and can be used interchangeably. The minimum supported CMake version is 3.10 (3.12 or later is recommended).

All details about features and settings for CMake are in the CMake online documentation. We focus below on the most important aspects with respect to compiling LAMMPS.
Prerequisites

This tutorial assumes that you are operating in a command-line environment using a shell like Bash.

- Linux: any Terminal window will work
- MacOS X: launch the Terminal application.
- Windows 10: install and run the Windows Subsystem for Linux

We also assume that you have downloaded and unpacked a recent LAMMPS source code package or used Git to create a clone of the LAMMPS sources on your compilation machine.

You should change into the top level directory of the LAMMPS source tree all paths mentioned in the tutorial are relative to that. Immediately after downloading it should look like this:

```bash
$ ls
bench doc lib potentials README tools
cmake examples LICENSE python src
```

Build versus source directory

When using CMake the build procedure is separated into multiple distinct phases:

1. **Configuration**: detect or define which features and settings should be enable and used and how LAMMPS should be compiled
2. **Compilation**: generate and compile all necessary source files and build libraries and executables.
3. **Installation**: copy selected files from the compilation into your file system, so they can be used without having to keep the source and build tree around.

The configuration and compilation of LAMMPS has to happen in a dedicated build directory which must be different from the source directory. Also the source directory (src) must remain pristine, so it is not allowed to “install” packages using the traditional make process and after an compilation attempt all created source files must be removed. This can be achieved with `make no-all purge`.

You can pick any folder outside the source tree. We recommend to create a folder `build` in the top-level directory, or multiple folders in case you want to have separate builds of LAMMPS with different options (build-parallel, build-serial) or with different compilers (build-gnu, build-clang, build-intel) and so on. All the auxiliary files created by one build process (executable, object files, log files, etc) are stored in this directory or sub-directories within it that CMake creates.

Running CMake

CLI version

In the (empty) build directory, we now run the command `cmake .. /cmake`, which will start the configuration phase and you will see the progress of the configuration printed to the screen followed by a summary of the enabled features, options and compiler settings. A typical summary screen will look like this:

```bash
$ cmake .. /cmake/
-- The CXX compiler identification is GNU 8.2.0
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++ - works
-- Detecting CXX compiler ABI info
-- Detecting CXX compiler ABI info - done
```

(continues on next page)
The `cmake` command has one mandatory argument, and that is a folder with either the file `CMakeLists.txt` or `CMakeCache.txt`. The `CMakeCache.txt` file is created during the CMake configuration run and contains all active settings, thus after a first run of CMake all future runs in the build folder can use the folder. And CMake
will know where to find the CMake scripts and reload the settings from the previous step. This means, that one can modify an existing configuration by re-running CMake, but only needs to provide flags indicating the desired change, everything else will be retained. One can also mix compilation and configuration, i.e. start with a minimal configuration and then, if needed, enable additional features and recompile.

The steps above will NOT compile the code. The compilation can be started in a portable fashion with `cmake --build ./`, or you use the selected built tool, e.g. `make`.

**TUI version**

For the text mode UI CMake program the basic principle is the same. You start the command `ccmake ../cmake` in the `build` folder.

This will show you the initial screen (left image) with the empty configuration cache. Now you type the ‘c’ key to run the configuration step. That will do a first configuration run and show the summary (center image). You exit the summary screen with ‘e’ and see now the main screen with detected options and settings. You can now make changes by moving up and down with the arrow keys of the keyboard and modify entries. For on/off settings, the enter key will toggle the state. For others, hitting enter will allow you to modify the value and you commit the change by hitting the enter key again or cancel using the escape key. All “new” settings will be marked with a star ‘*’ and for as long as one setting is marked like this, you have to re-run the configuration by hitting the ‘c’ key again, sometimes multiple times unless the TUI shows the word ”generate” next to the letter ‘g’ and by hitting the ”g” key the build files will be written to the folder and the TUI exits. You can quit without generating build files by hitting ‘q’.

**GUI version**

For the graphical CMake program the steps are similar to the TUI version. You can type the command `cmake-gui ../cmake` in the `build` folder. In this case the path to the CMake script folder is not required, it can also be entered from the GUI.
Again, you start with an empty configuration cache (left image) and need to start the configuration step. For the very first configuration in a folder, you will have a pop-up dialog (center image) asking to select the desired build tool and some configuration settings (stick with the default) and then you get the option screen with all new settings highlighted in red. You can modify them (or not) and click on the “configure” button again until satisfied and click on the “generate” button to write out the build files. You can exit the GUI from the “File” menu or hit “ctrl-q”.

Setting options

Options that enable, disable or modify settings are modified by setting the value of CMake variables. This is done on the command line with the -D flag in the format -D VARIABLE=value, e.g. -D CMAKE_BUILD_TYPE=Release or -D BUILD_MPI=on. There is one quirk: when used before the CMake directory, there may be a space between the -D flag and the variable, after it must not be. Such CMake variables can have boolean values (on/off, yes/no, or 1/0 are all valid) or are strings representing a choice, or a path, or are free format. If the string would contain whitespace, it must be put in quotes, for example -D CMAKE_TUNE_FLAGS="-ftree-vectorize -ffast-math".

CMake variables fall into two categories: 1) common CMake variables that are used by default for any CMake configuration setup and 2) project specific variables, i.e. settings that are specific for LAMMPS. Also CMake variables can be flagged as advanced, which means they are not shown in the text mode or graphical CMake program in the overview of all settings by default, but only when explicitly requested (by hitting the ‘t’ key or clicking on the ‘Advanced’ check-box).

Some common CMake variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMAKE_INSTALL_PREFIX</td>
<td>root directory of install location for make install (default: $HOME/.local)</td>
</tr>
<tr>
<td>CMAKE_BUILD_TYPE</td>
<td>controls compilation options: one of RelWithDebInfo (default), Release, Debug, MinSizeRel</td>
</tr>
<tr>
<td>BUILD_SHARED_LIBS</td>
<td>if set to on build the LAMMPS library as shared library (default: off)</td>
</tr>
<tr>
<td>CMAKE_MAKE_PROGRAM</td>
<td>name/path of the compilation command (default depends on -G option, usually make)</td>
</tr>
<tr>
<td>CMAKE_VERBOSE_MAKEFILE</td>
<td>if set to on echo commands while executing during build (default: off)</td>
</tr>
<tr>
<td>CMAKE_C_COMPILER</td>
<td>C compiler to be used for compilation (default: system specific, gcc on Linux)</td>
</tr>
<tr>
<td>CMAKE_CXX_COMPILER</td>
<td>C++ compiler to be used for compilation (default: system specific, g++ on Linux)</td>
</tr>
<tr>
<td>CMAKE_Fortran_COMPILER</td>
<td>Fortran compiler to be used for compilation (default: system specific, gfortran on Linux)</td>
</tr>
<tr>
<td>CXX_COMPILER_LAUNCHER</td>
<td>tool to launch the C++ compiler, e.g. ccache or distcc for faster compilation (default: empty)</td>
</tr>
</tbody>
</table>
Some common LAMMPS specific variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD_MPI</td>
<td>build LAMMPS with MPI support (default: on if a working MPI available, else off)</td>
</tr>
<tr>
<td>BUILD_OMP</td>
<td>build LAMMPS with OpenMP support (default: on if compiler supports OpenMP fully, else off)</td>
</tr>
<tr>
<td>BUILDTOOLS</td>
<td>compile some additional executables from the tools folder (default: off)</td>
</tr>
<tr>
<td>BUILD_DOC</td>
<td>include building the HTML format documentation for packaging/installing (default: off)</td>
</tr>
<tr>
<td>CMAKE_TUNE_FLAGS</td>
<td>common compiler flags, for optimization or instrumentation (default:)</td>
</tr>
<tr>
<td>LAMMPS_MACHINE</td>
<td>when set to name the LAMMPS executable and library will be called lmp_name and liblammps_name.a</td>
</tr>
<tr>
<td>LAMMPS_EXCEPTIONS</td>
<td>when set to on errors will throw a C++ exception instead of aborting (default: off)</td>
</tr>
<tr>
<td>FFT</td>
<td>select which FFT library to use: FFTW3, MKL, KISS (default, unless FFTW3 is found)</td>
</tr>
<tr>
<td>FFT_SINGLE</td>
<td>select whether to use single precision FFTs (default: off)</td>
</tr>
<tr>
<td>WITH_JPEG</td>
<td>whether to support JPEG format in dump image (default: on if found)</td>
</tr>
<tr>
<td>WITH_GZIP</td>
<td>whether to support PNG format in dump image (default: on if found)</td>
</tr>
<tr>
<td>WITH_GZIP</td>
<td>whether to support reading and writing compressed files (default: on if found)</td>
</tr>
<tr>
<td>WITH_FFMPEG</td>
<td>whether to support generating movies with dump movie (default: on if found)</td>
</tr>
</tbody>
</table>

Enabling or disabling LAMMPS packages

The LAMMPS software is organized into a common core that is always included and a large number of add-on packages that have to be enabled to be included into a LAMMPS executable. Packages are enabled through setting variables of the kind PKG_<NAME> to on and disabled by setting them to off (or using yes, no, 1, 0 correspondingly). <NAME> has to be replaced by the name of the package, e.g. MOLECULE or USER-MISC.

Using presets

Since LAMMPS has a lot of optional features and packages, specifying them all on the command line can be tedious. Or when selecting a different compiler toolchain, multiple options have to be changed consistently and that is rather error prone. Or when enabling certain packages, they require consistent settings to be operated in a particular mode. For this purpose, we are providing a selection of “preset files” for CMake in the folder cmake/presets. They represent a way to pre-load or override the CMake configuration cache by setting or changing CMake variables. Preset files are loaded using the -C command line flag. You can combine loading multiple preset files or change some variables later with additional -D flags. A few examples:

```
cmake -C ../cmake/presets/minimal.cmake -D PKG_MISC=on ../cmake
cmake -C ../cmake/presets/clang.cmake -C ../cmake/presets/most.cmake ../cmake
cmake -C ../cmake/presets/minimal.cmake -D BUILD_MPI=off ../cmake
```

The first command will install the packages KSPACE, MANYBODY, MOLECULE, RIGID and MISC; the first four from the preset file and the fifth from the explicit variable definition. The second command will first switch the compiler toolchain to use the Clang compilers and install a large number of packages that are not depending on any special external libraries or tools and are not very unusual. The third command will enable the first four packages like above and then enforce compiling LAMMPS as a serial program (using the MPI STUBS library).

It is also possible to do this incrementally.

```
cmake -C ../cmake/presets/minimal.cmake ../cmake
```
will achieve the same configuration like in the first example above. In this scenario it is particularly convenient to do the second configuration step using either the text mode or graphical user interface (ccmake or cmake-gui).

**Compilation and build targets**

The actual compilation will be started by running the selected build command (on Linux this is by default `make`, see below how to select alternatives). You can also use the portable command `cmake --build .` which will adapt to whatever the selected build command is. This is particularly convenient, if you have set a custom build command via the `CMAKE_MAKE_PROGRAM` variable.

When calling the build program, you can also select which “target” is to be build through appending the `--target` flag and the name of the target to the build command. When using `make` as build tool, you can just append the target name to the command. Example: `cmake --build . --target all` or `make all`. The following abstract targets are available:

<table>
<thead>
<tr>
<th>Target</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>build “everything” (default)</td>
</tr>
<tr>
<td>lammps</td>
<td>build the LAMMPS library and executable</td>
</tr>
<tr>
<td>doc</td>
<td>build the HTML documentation (if configured)</td>
</tr>
<tr>
<td>install</td>
<td>install all target files into folders in <code>CMAKE_INSTALL_PREFIX</code></td>
</tr>
<tr>
<td>test</td>
<td>run some tests (if configured with <code>-D ENABLE_TESTING=on</code>)</td>
</tr>
<tr>
<td>clean</td>
<td>remove all generated files</td>
</tr>
</tbody>
</table>

**Choosing generators**

While CMake usually defaults to creating makefiles to compile software with the `make` program, it supports multiple alternate build tools (e.g. `ninja-build` which tends to be faster and more efficient in parallelizing builds than `make`) and can generate project files for integrated development environments (IDEs) like VisualStudio, Eclipse or CodeBlocks. This is specific to how the local CMake version was configured and compiled. The list of available options can be seen at the end of the output of `cmake --help`. Example on Fedora 31 this is:

Generators

The following generators are available on this platform (* marks default):

- Unix Makefiles = Generates standard UNIX makefiles.
- Ninja = Generates build.ninja files.
- Ninja Multi-Config = Generates build-<Config>.ninja files.
- Watcom WMake = Generates Watcom WMake makefiles.
- CodeBlocks - Ninja = Generates CodeBlocks project files.
- CodeBlocks - Unix Makefiles = Generates CodeBlocks project files.
- CodeLite - Ninja = Generates CodeLite project files.
- CodeLite - Unix Makefiles = Generates CodeLite project files.
- Sublime Text 2 - Ninja = Generates Sublime Text 2 project files.
- Sublime Text 2 - Unix Makefiles = Generates Sublime Text 2 project files.
- Kate - Ninja = Generates Kate project files.
- Kate - Unix Makefiles = Generates Kate project files.
- Eclipse CDT4 - Ninja = Generates Eclipse CDT 4.0 project files.
- Eclipse CDT4 - Unix Makefiles = Generates Eclipse CDT 4.0 project files.

Below is a screenshot of using the CodeBlocks IDE with the ninja build tool after running CMake as follows:
8.1.2 LAMMPS GitHub tutorial

written by Stefan Paquay

This document describes the process of how to use GitHub to integrate changes or additions you have made to LAMMPS into the official LAMMPS distribution. It uses the process of updating this very tutorial as an example to describe the individual steps and options. You need to be familiar with git and you may want to have a look at the git book to reacquaint yourself with some of the more advanced git features used below.

As of fall 2016, submitting contributions to LAMMPS via pull requests on GitHub is the preferred option for integrating contributed features or improvements to LAMMPS, as it significantly reduces the amount of work required by the LAMMPS developers. Consequently, creating a pull request will increase your chances to have your contribution included and will reduce the time until the integration is complete. For more information on the requirements to have your code included into LAMMPS please see this page.

Making an account

First of all, you need a GitHub account. This is fairly simple, just go to GitHub and create an account by clicking the “Sign up for GitHub” button. Once your account is created, you can sign in by clicking the button in the top left and filling in your username or e-mail address and password.
Forking the repository

To get changes into LAMMPS, you need to first fork the lammps/lammps repository on GitHub. At the time of writing, master is the preferred target branch. Thus go to LAMMPS on GitHub and make sure branch is set to "master", as shown in the figure below.

![GitHub interface showing repository settings]

If it is not, use the button to change it to master. Once it is, use the fork button to create a fork.

This will create a fork (which is essentially a copy, but uses less resources) of the LAMMPS repository under your own GitHub account. You can make changes in this fork and later file pull requests to allow the upstream repository to merge changes from your own fork into the one we just forked from (or others that were forked from the same repository). At the same time, you can set things up, so you can include changes from upstream into your repository and thus keep it in sync with the ongoing LAMMPS development.

Adding changes to your own fork

Additions to the upstream version of LAMMPS are handled using feature branches. For every new feature, a so-called feature branch is created, which contains only those modification relevant to one specific feature. For example, adding a single fix would consist of creating a branch with only the fix header and source file and nothing else. It is explained in more detail here: feature branch workflow.

Feature branches

First of all, create a clone of your version on github on your local machine via HTTPS:

```bash
$ git clone https://github.com/<your user name>/lammps.git <some name>
```

or, if you have set up your GitHub account for using SSH keys, via SSH:

```bash
$ git clone git@github.com:<your user name>/lammps.git
```

You can find the proper URL by clicking the “Clone or download”-button:
The above command copies (“clones”) the git repository to your local machine to a directory with the name you chose. If none is given, it will default to “lammps”. Typical names are “mylammps” or something similar.

You can use this local clone to make changes and test them without interfering with the repository on GitHub.

To pull changes from upstream into this copy, you can go to the directory and use git pull:

```
$ cd mylammps
$ git checkout master
$ git pull https://github.com/lammps/lammps
```

You can also add this URL as a remote:

```
$ git remote add lammps_upstream https://www.github.com/lammps/lammps
```

At this point, you typically make a feature branch from the updated master branch for the feature you want to work on. This tutorial contains the workflow that updated this tutorial, and hence we will call the branch “github-tutorial-update”:

```
$ git checkout -b github-tutorial-update master
```

Now that we have changed branches, we can make our changes to our local repository. Just remember that if you want to start working on another, unrelated feature, you should switch branches!

**After changes are made**

After everything is done, add the files to the branch and commit them:

```
$ git add doc/src/Howto_github.txt
$ git add doc/src/JPG/tutorial*.png
```

**Warning:** Do not use `git commit -a` (or `git add -A`). The `-a` flag (or `-A` flag) will automatically include all modified and new files and that is rarely the behavior you want. It can easily lead to accidentally adding unrelated and unwanted changes into the repository. Instead it is preferable to explicitly use `git add`, `git rm`, `git mv` for adding, removing, renaming individual files, respectively, and then `git commit` to finalize the commit. Carefully check all pending changes with `git status` before committing them. If you find doing this on the command line too tedious, consider using a GUI, for example the one included in git distributions written in Tk, i.e. use `git gui` (on some Linux distributions it may be required to install an additional package to use it).
After adding all files, the change set can be committed with some useful message that explains the change.

$ git commit -m 'Finally updated the github tutorial'

After the commit, the changes can be pushed to the same branch on GitHub:

$ git push

Git will ask you for your user name and password on GitHub if you have not configured anything. If your local branch is not present on GitHub yet, it will ask you to add it by running

$ git push --set-upstream origin github-tutorial-update

If you correctly type your user name and password, the feature branch should be added to your fork on GitHub. If you want to make really sure you push to the right repository (which is good practice), you can provide it explicitly:

$ git push origin

or using an explicit URL:

$ git push git@github.com:Pakketeretet2/lammps.git

Filing a pull request

Up to this point in the tutorial, all changes were to your clones of LAMMPS. Eventually, however, you want this feature to be included into the official LAMMPS version. To do this, you will want to file a pull request by clicking on the “New pull request” button:

Make sure that the current branch is set to the correct one, which, in this case, is “github-tutorial-update”. If done correctly, the only changes you will see are those that were made on this branch.

This will open up a new window that lists changes made to the repository. If you are just adding new files, there is not much to do, but I suppose merge conflicts are to be resolved here if there are changes in existing files. If all changes can automatically be merged, green text at the top will say so and you can click the “Create pull request” button, see image.
Before creating the pull request, make sure the short title is accurate and add a comment with details about your pull request. Here you write what your modifications do and why they should be incorporated upstream.

Note the checkbox that says “Allow edits from maintainers”. This is checked by default checkbox (although in my version of Firefox, only the checkmark is visible):

If it is checked, maintainers can immediately add their own edits to the pull request. This helps the inclusion of your branch significantly, as simple/trivial changes can be added directly to your pull request branch by the LAMMPS maintainers. The alternative would be that they make changes on their own version of the branch and file a reverse pull request to you. Just leave this box checked unless you have a very good reason not to.

Now just write some nice comments and click on “Create pull request”.
After filing a pull request

**Note:** When you submit a pull request (or ask for a pull request) for the first time, you will receive an invitation to become a LAMMPS project collaborator. Please accept this invite as being a collaborator will simplify certain administrative tasks and will probably speed up the merging of your feature, too.

You will notice that after filing the pull request, some checks are performed automatically:
GitHub tutorial update #315

Pakketeret2 wants to merge 2 commits into lammpe:master from Pakketeret2:github-tutorial-update

Conversation 0  Commits 2  Files changed 5

Pakketeret2 commented a minute ago

Update to the Github tutorial with proper branch names etc.
Some images are currently broken, they will be added in a second push, but are dependent on this first pull.

Pakketeret2 added some commits 18 minutes ago

Finally updated the github tutorial.
Almost done with the tutorial now.

Add more commits by pushing to the github-tutorial-update branch on Pakketeret2/lammpe.

Some checks haven’t completed yet

3 pending checks

* [lammps/pull-requests/openmpi-pr] — head run started
* [lammps/pull-requests/serial-pr] — head run started
* [lammps/pull-requests/shlib-pr] — head run started

This pull request can be automatically merged by project collaborators

Only those with write access to this repository can merge pull requests.

Merge pull request

You’re not authorized to merge this pull request.

If all is fine, you will see this:
If any of the checks are failing, your pull request will not be processed, as your changes may break compilation for certain configurations or may not merge cleanly. It is your responsibility to remove the reason(s) for the failed test(s).

If you need help with this, please contact the LAMMPS developers by adding a comment explaining your problems with resolving the failed tests.

A few further interesting things (can) happen to pull requests before they are included.

**Additional changes**

First of all, any additional changes you push into your branch in your repository will automatically become part of the pull request:

This means you can add changes that should be part of the feature after filing the pull request, which is useful in case you have forgotten them, or if a developer has requested that something needs to be changed before the feature can be accepted into the official LAMMPS version. After each push, the automated checks are run again.

**Labels**

LAMMPS developers may add labels to your pull request to assign it to categories (mostly for bookkeeping purposes), but a few of them are important: needs_work, work_in_progress, test-for-regression, and full-regression-test. The first two indicate, that your pull request is not considered to be complete. With “needs_work” the burden is on exclusively on you; while “work_in_progress” can also mean, that a LAMMPS developer may want to add changes. Please watch the comments to the pull requests. The two “test” labels are used to trigger extended tests before the code is merged. This is sometimes done by LAMMPS developers, if they suspect that there may be some subtle side effects from your changes. It is not done by default, because those tests are very time consuming.

**Reviews**

As of Summer 2018, a pull request needs at least 1 approving review from a LAMMPS developer with write access to the repository. In case your changes touch code that certain developers are associated with, they are auto-requested by the GitHub software. Those associations are set in the file .github/CODEOWNERS Thus if you want to be automatically notified to review when anybody changes files or packages, that you have contributed to LAMMPS, you can add suitable patterns to that file, or a LAMMPS developer may add you.
Otherwise, you can also manually request reviews from specific developers, or LAMMPS developers - in their assessment of your pull request - may determine who else should be reviewing your contribution and add that person. Through reviews, LAMMPS developers also may request specific changes from you. If those are not addressed, your pull requests cannot be merged.

**Assignees**

There is an assignee property for pull requests. If the request has not been reviewed by any developer yet, it is not assigned to anyone. After revision, a developer can choose to assign it to either a) you, b) a LAMMPS developer (including him/herself) or c) Axel Kohlmeyer (akohlmey).

- Case a) happens if changes are required on your part
- Case b) means that at the moment, it is being tested and reviewed by a LAMMPS developer with the expectation that some changes would be required. After the review, the developer can choose to implement changes directly or suggest them to you.
- Case c) means that the pull request has been assigned to the developer overseeing the merging of pull requests into the master branch.

In this case, Axel assigned the tutorial to Steve:

**Edits from LAMMPS maintainers**

If you allowed edits from maintainers (the default), any LAMMPS maintainer can add changes to your pull request. In this case, both Axel and Richard made changes to the tutorial:

**Reverse pull requests**

Sometimes, however, you might not feel comfortable having other people push changes into your own branch, or maybe the maintainers are not sure their idea was the right one. In such a case, they can make changes, reassign you as the assignee, and file a “reverse pull request”, i.e. file a pull request in your GitHub repository to include changes in the branch, that you have submitted as a pull request yourself. In that case, you can choose to merge their changes back into your branch, possibly make additional changes or corrections and proceed from there. It looks something like this:
For some reason, the highlighted button did not work in my case, but I can go to my own repository and merge the pull request from there:

some formatting updates and text rewrites for your pull request #1

Be sure to check the changes to see if you agree with them by clicking on the tab button:
some formatting updates and text rewrites for your pull request #1

In this case, most of it is changes in the markup and a short rewrite of Axel’s explanation of the “git gui” and “git add” commands.

Because the changes are OK with us, we are going to merge by clicking on “Merge pull request”. After a merge it looks like this:

In this case, most of it is changes in the markup and a short rewrite of Axel’s explanation of the “git gui” and “git add” commands.
Now, since in the meantime our local text for the tutorial also changed, we need to pull Axel’s change back into our branch, and merge them:

```
$ git add Howto_github.txt
$ git add JPG/tutorial_reverse_pull_request*.png
$ git commit -m "Updated text and images on reverse pull requests"
$ git pull
```

In this case, the merge was painless because git could auto-merge:

```
[ master @ src ] % git pull
Auto-merging doc/src/tutorial_github.txt
Merging [ auto ]
merging doc/src/tutorial_github.txt | 66 ++++++++++++++++++++++++++++++++++++++++
1 file changed, 66 insertions(+), 31 deletions(-)
[master @ src ] %
```

With Axel’s changes merged in and some final text updates, our feature branch is now perfect as far as we are concerned, so we are going to commit and push again:

```
$ git add Howto_github.txt
$ git add JPG/tutorial_reverse_pull_request6.png
$ git commit -m "Merged Axel's suggestions and updated text"
$ git push git@github.com:Pakketeretet2/lammps
```

This merge also shows up on the lammps GitHub page:

```
polish the introduction, some more clarifications, corrections and
```

```
[ akohlme ] referenced this pull request in Pakketeretet2/lammps 2 hours ago
A few more suggested edits to the tutorial from me #2
```

After a merge

8.1. Tutorials howto
When everything is fine, the feature branch is merged into the master branch:

```
$ git checkout master
$ git pull master
$ git branch -d github-tutorial-update
```

Now one question remains: What to do with the feature branch that got merged into upstream?

It is in principle safe to delete them from your own fork. This helps keep it a bit more tidy. Note that you first have to switch to another branch:

```
$ git checkout master
$ git pull master
$ git branch -d github-tutorial-update
```

If you do not pull first, it is not really a problem but git will warn you at the next statement that you are deleting a local branch that was not yet fully merged into HEAD. This is because git does not yet know your branch just got merged into LAMMPS upstream. If you first delete and then pull, everything should still be fine.

Finally, if you delete the branch locally, you might want to push this to your remote(s) as well:

```
$ git push origin :github-tutorial-update
```

Recent changes in the workflow

Some changes to the workflow are not captured in this tutorial. For example, in addition to the master branch, to which all new features should be submitted, there is now also an “unstable” and a “stable” branch; these have the same content as “master”, but are only updated after a patch release or stable release was made. Furthermore, the naming of the patches now follow the pattern “patch_<Day><Month><Year>” to simplify comparisons between releases. Finally, all patches and submissions are subject to automatic testing and code checks to make sure they at the very least compile.

A discussion of the LAMMPS developer GitHub workflow can be found in the file doc/github-development-workflow.md

8.1.3 PyLammps Tutorial

Contents

- PyLammps Tutorial
  - Overview
    - Comparison of lammps and PyLammps interfaces
      - lammps.lammps
      - lammps.PyLammps
  - Quick Start
Overview

PyLammps is a Python wrapper class for LAMMPS which can be created on its own or use an existing lammps Python object. It creates a simpler, more “pythonic” interface to common LAMMPS functionality, in contrast to the lammps.py wrapper for the C-style LAMMPS library interface which is written using Python ctypes. The lammps.py wrapper is discussed on the Python library doc page.

Unlike the flat ctypes interface, PyLammps exposes a discoverable API. It no longer requires knowledge of the underlying C++ code implementation. Finally, the IPyLammps wrapper builds on top of PyLammps and adds some additional features for IPython integration into Jupyter notebooks, e.g. for embedded visualization output from dump style image.
Comparison of lammps and PyLammps interfaces

**lammps.lammps**

- uses ctypes
- direct memory access to native C++ data
- provides functions to send and receive data to LAMMPS
- requires knowledge of how LAMMPS internally works (C pointers, etc)

**lammps.PyLammps**

- higher-level abstraction built on top of original ctypes interface
- manipulation of Python objects
- communication with LAMMPS is hidden from API user
- shorter, more concise Python
- better IPython integration, designed for quick prototyping

Quick Start

System-wide Installation

**Step 1: Building LAMMPS as a shared library**

To use LAMMPS inside of Python it has to be compiled as shared library. This library is then loaded by the Python interface. In this example we enable the MOLECULE package and compile LAMMPS with C++ exceptions, PNG, JPEG and FFMPEG output support enabled.

Step 1a: For the CMake based build system, the steps are:

```
mkdir $LAMMPS_DIR/build-shared
cd $LAMMPS_DIR/build-shared
# MPI, PNG, Jpeg, FFMPEG are auto-detected
cmake ../cmake -DPKG_MOLECULE=yes -DLAMMPS_EXCEPTIONS=yes -DBUILD_LIB=yes -DBUILD_SHARED_LIBS=yes
make
```

Step 1b: For the legacy, make based build system, the steps are:

```
  cd $LAMMPS_DIR/src
  # add packages if necessary
  make yes-MOLECULE
  # compile shared library using Makefile
  make mpi mode=shlib LMP_INC="-DLAMMPS_PNG -DLAMMPS_JPEG -DLAMMPS_FFMPEG -DLAMMPS_EXCEPTIONS" JPG_LIB="-lpng -ljpeg"
```
Step 2: Installing the LAMMPS Python package

PyLammps is part of the lammps Python package. To install it simply install that package into your current Python installation with:

```
make install-python
```

**Note:** Recompiling the shared library requires re-installing the Python package

### Installation inside of a virtualenv

You can use virtualenv to create a custom Python environment specifically tuned for your workflow.

**Benefits of using a virtualenv**

- isolation of your system Python installation from your development installation
- installation can happen in your user directory without root access (useful for HPC clusters)
- installing packages through pip allows you to get newer versions of packages than e.g., through apt-get or yum package managers (and without root access)
- you can even install specific old versions of a package if necessary

**Prerequisite (e.g. on Ubuntu)**

```
apt-get install python-virtualenv
```

### Creating a virtualenv with lammps installed

```
# create virtualenv named 'testing'
virtualenv $HOME/python/testing

# activate 'testing' environment
source $HOME/python/testing/bin/activate
```

Now configure and compile the LAMMPS shared library as outlined above. When using CMake and the shared library has already been build, you need to re-run CMake to update the location of the python executable to the location in the virtual environment with:

```
cmake . -DPYTHON_EXECUTABLE=$(which python)

# install LAMMPS package in virtualenv
(testing) make install-python

# install other useful packages
(testing) pip install matplotlib jupyter mpi4py
...

# return to original shell
(testing) deactivate
```
Creating a new instance of PyLammps

To create a PyLammps object you need to first import the class from the lammps module. By using the default constructor, a new lammps instance is created.

```python
from lammps import PyLammps
L = PyLammps()
```

You can also initialize PyLammps on top of this existing lammps object:

```python
from lammps import lammps, PyLammps
lmp = lammps()
L = PyLammps(ptr=lmp)
```

Commands

Sending a LAMMPS command with the existing library interfaces is done using the command method of the lammps object instance.

For instance, let’s take the following LAMMPS command:

```
region box block 0 10 0 5 -0.5 0.5
```

In the original interface this command can be executed with the following Python code if `L` was a lammps instance:

```python
L.command("region box block 0 10 0 5 -0.5 0.5")
```

With the PyLammps interface, any command can be split up into arbitrary parts separated by white-space, passed as individual arguments to a region method.

```python
L.region("box block", 0, 10, 0, 5, -0.5, 0.5)
```

Note that each parameter is set as Python literal floating-point number. In the PyLammps interface, each command takes an arbitrary parameter list and transparently merges it to a single command string, separating individual parameters by white-space.

The benefit of this approach is avoiding redundant command calls and easier parameterization. In the original interface parameterization needed to be done manually by creating formatted strings.

```python
L.command("region box block %f %f %f %f %f %f" % (xlo, xhi, ylo, yhi, zlo, zhi))
```

In contrast, methods of PyLammps accept parameters directly and will convert them automatically to a final command string.

```python
L.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```
System state

In addition to dispatching commands directly through the PyLammps object, it also provides several properties which allow you to query the system state.

**L.system**  Is a dictionary describing the system such as the bounding box or number of atoms  
**L.system.xlo, L.system.xhi**  bounding box limits along x-axis  
**L.system.ylo, L.system.yhi**  bounding box limits along y-axis  
**L.system.zlo, L.system.zhi**  bounding box limits along z-axis  

**L.communication**  configuration of communication subsystem, such as the number of threads or processors  
**L.communication.nthreads**  number of threads used by each LAMMPS process  
**L.communication.nprocs**  number of MPI processes used by LAMMPS  

**L.fixes**  List of fixes in the current system  
**L.computes**  List of active computes in the current system  
**L.dump**  List of active dumps in the current system  
**L.groups**  List of groups present in the current system

Working with LAMMPS variables

LAMMPS variables can be both defined and accessed via the PyLammps interface.

To define a variable you can use the `variable` command:

```python
L.variable("a index 2")
```

A dictionary of all variables is returned by `L.variables`
you can access an individual variable by retrieving a variable object from the `L.variables` dictionary by name

```python
a = L.variables['a']
```

The variable value can then be easily read and written by accessing the value property of this object.

```python
print(a.value)
a.value = 4
```

Retrieving the value of an arbitrary LAMMPS expressions

LAMMPS expressions can be immediately evaluated by using the `eval` method. The passed string parameter can be any expression containing global thermo values, variables, compute or fix data.

```python
result = L.eval("ke") # kinetic energy
result = L.eval("pe") # potential energy
result = L.eval("v_t/2.0")
```
Accessing atom data

All atoms in the current simulation can be accessed by using the L.atoms list. Each element of this list is an object which exposes its properties (id, type, position, velocity, force, etc.).

```python
# access first atom
L.atoms[0].id
L.atoms[0].type

# access second atom
L.atoms[1].position
L.atoms[1].velocity
L.atoms[1].force
```

Some properties can also be used to set:

```python
# set position in 2D simulation
L.atoms[0].position = (1.0, 0.0)

# set position in 3D simulation
L.atoms[0].position = (1.0, 0.0, 1.)
```

Evaluating thermo data

Each simulation run usually produces thermo output based on system state, computes, fixes or variables. The trajectories of these values can be queried after a run via the L.runs list. This list contains a growing list of run data. The first element is the output of the first run, the second element that of the second run.

```python
L.run(1000)
L.runs[0] # data of first 1000 time steps

L.run(1000)
L.runs[1] # data of second 1000 time steps
```

Each run contains a dictionary of all trajectories. Each trajectory is accessible through its thermo name:

```python
L.runs[0].thermo.Step # list of time steps in first run
L.runs[0].thermo.Ke  # list of kinetic energy values in first run
```

Together with matplotlib plotting data out of LAMMPS becomes simple:

```python
import matplotlib.pyplot as plt
steps = L.runs[0].thermo.Step
ke   = L.runs[0].thermo.Ke
plt.plot(steps, ke)
```
Error handling with PyLammps

Compiling the shared library with C++ exception support provides a better error handling experience. Without exceptions the LAMMPS code will terminate the current Python process with an error message. C++ exceptions allow capturing them on the C++ side and rethrowing them on the Python side. This way you can handle LAMMPS errors through the Python exception handling mechanism.

Warning: Capturing a LAMMPS exception in Python can still mean that the current LAMMPS process is in an illegal state and must be terminated. It is advised to save your data and terminate the Python instance as quickly as possible.

Using PyLammps in IPython notebooks and Jupyter

If the LAMMPS Python package is installed for the same Python interpreter as IPython, you can use PyLammps directly inside of an IPython notebook inside of Jupyter. Jupyter is a powerful integrated development environment (IDE) for many dynamic languages like Python, Julia and others, which operates inside of any web browser. Besides auto-completion and syntax highlighting it allows you to create formatted documents using Markup, mathematical formulas, graphics and animations intermixed with executable Python code. It is a great format for tutorials and showcasing your latest research.

To launch an instance of Jupyter simply run the following command inside your Python environment (this assumes you followed the Quick Start instructions):

```
jupyter notebook
```

IPyLammps Examples

Examples of IPython notebooks can be found in the python/examples/pylammps sub-directory. To open these notebooks launch `jupyter notebook` inside this directory and navigate to one of them. If you compiled and installed a LAMMPS shared library with exceptions, PNG, JPEG and FFMPEG support you should be able to rerun all of these notebooks.

Validating a dihedral potential

This example showcases how an IPython Notebook can be used to compare a simple LAMMPS simulation of a harmonic dihedral potential to its analytical solution. Four atoms are placed in the simulation and the dihedral potential is applied on them using a datafile. Then one of the atoms is rotated along the central axis by setting its position from Python, which changes the dihedral angle.

```python
phi = [d * math.pi / 180 for d in range(360)]
pos = [(1.0, math.cos(p), math.sin(p)) for p in phi]
pe = []
for p in pos:
    L.atoms[3].position = p
    L.run(0)
    pe.append(L.eval("pe"))
```

By evaluating the potential energy for each position we can verify that trajectory with the analytical formula. To compare both solutions, we plot both trajectories over each other using matplotlib, which embeds the generated plot inside the IPython notebook.
Running a Monte Carlo relaxation

This second example shows how to use PyLammps to create a 2D Monte Carlo Relaxation simulation, computing and plotting energy terms and even embedding video output.

Initially, a 2D system is created in a state with minimal energy.
It is then disordered by moving each atom by a random delta.

```python
random.seed(27848)
deltaperturb = 0.2
for i in range(L.system.natoms):
    x, y = L.atoms[i].position
    dx = deltaperturb * random.uniform(-1, 1)
    dy = deltaperturb * random.uniform(-1, 1)
    L.atoms[i].position = (x+dx, y+dy)
L.run(0)
```
Finally, the Monte Carlo algorithm is implemented in Python. It continuously moves random atoms by a random delta and only accepts certain moves.

```python
estart = L.eval("pe")
elast = estart

naccept = 0
energies = [estart]
niterations = 3000
deltamove = 0.1
kT = 0.05

natoms = L.system.natoms

for i in range(niterations):
    iatom = random.randrange(0, natoms)
    current_atom = L.atoms[iatom]
    x0, y0 = current_atom.position
```

(continues on next page)
dx = deltamove \* random.uniform(-1, 1)
dy = deltamove \* random.uniform(-1, 1)

current_atom.position = (x0+dx, y0+dy)

L.run(1, "pre no post no")
e = L.eval("pe")
energies.append(e)

if e <= elast:
    naccept += 1
    elast = e
elif random.random() <= math.exp(natoms\*(elast-e)/kT):
    naccept += 1
    elast = e
else:
    current_atom.position = (x0, y0)

The energies of each iteration are collected in a Python list and finally plotted using matplotlib.
The IPython notebook also shows how to use dump commands and embed video files inside of the IPython notebook.

**Using PyLammps and mpi4py (Experimental)**

PyLammps can be run in parallel using mpi4py. This python package can be installed using

```bash
pip install mpi4py
```

The following is a short example which reads in an existing LAMMPS input file and executes it in parallel. You can find in.melt in the examples/melt folder.

```python
from mpi4py import MPI
from lammps import PyLammps

L = PyLammps()
L.file("in.melt")

if MPI.COMM_WORLD.rank == 0:
    print("Potential energy: ", L.eval("pe"))
```

(continues on next page)
To run this script (melt.py) in parallel using 4 MPI processes we invoke the following mpirun command:

```
mpirun -np 4 python melt.py
```

**Warning:** Any command must be executed by all MPI processes. However, evaluations and querying the system state is only available on rank 0.

### Feedback and Contributing

If you find this Python interface useful, please feel free to provide feedback and ideas on how to improve it to Richard Berger (richard.berger@temple.edu). We also want to encourage people to write tutorial style IPython notebooks showcasing LAMMPS usage and maybe their latest research results.

### 8.1.4 Using LAMMPS on Windows 10 with WSL

written by Richard Berger

It's always been tricky for us to have LAMMPS users and developers work on Windows. We primarily develop LAMMPS to run on Linux clusters. To teach LAMMPS in workshop settings, we had to redirect Windows users to Linux Virtual Machines such as VirtualBox or Unix-like compilation with Cygwin.

With the latest updates in Windows 10 (Version 2004, Build 19041 or higher), Microsoft has added a new way to work on Linux-based code. The Windows Subsystem for Linux (WSL). With WSL Version 2, you now get a Linux Virtual Machine that transparently integrates into Windows. All you need is to ensure you have the latest Windows updates installed and enable this new feature. Linux VMs are then easily installed using the Microsoft Store.

In this tutorial, I’ll show you how to set up and compile LAMMPS for both serial and MPI usage in WSL2.

### Installation

### Upgrade to the latest Windows 10

Type “Updates” in Windows Start and select “Check for Updates”.

---

8.1. Tutorials howto 213
Install all pending updates and reboot your system as many times as necessary. Continue until your Windows installation is updated.

Verify your system has at least version 2004 and build 19041 or later. You can find this information by clicking on
Enable WSL

Next, we must install two additional Windows features to enable WSL support. Open a PowerShell window as an administrator. Type “PowerShell” in Windows Start and select “Run as Administrator”.

“OS build info”. 
Windows will ask you for administrator access. After you accept a new command line window will appear. Type in the following command to install WSL:

```
dism.exe /online /enable-feature /featurename:Microsoft-Windows-Subsystem-Linux /all /norestart
```

Next, enable the VirtualMachinePlatform feature using the following command:

```
dism.exe /online /enable-feature /featurename:VirtualMachinePlatform /all /norestart
```
Finally, reboot your system.

**Update WSL kernel component**

Download and install the WSL Kernel Component Update. Afterwards, reboot your system.

**Set WSL2 as default**

Again, open PowerShell as administrator and run the following command:

```bash
wsl --set-default-version 2
```

This command ensures that all future Linux installations will use WSL version 2.

**Install a Linux Distribution**

Next, we need to install a Linux distribution via the Microsoft Store. Install Ubuntu 20.04 LTS. Once installed, you can launch it like any other application from the Start Menu.
Initial Setup

The first time you launch the Ubuntu Linux console, it will prompt you for a UNIX username and password. You will need this password to perform `sudo` commands later. Once completed, your Linux shell is ready for use. All your actions and commands will run as the Linux user you specified.
Windows Explorer / WSL integration

Your Linux installation will have its own Linux filesystem, which contains the Ubuntu files. Your Linux user will have a regular Linux home directory in `/home/<USERNAME>`. This directory is different from your Windows User directory. Windows and Linux filesystems are connected through WSL.

All hard drives in Windows are accessible in the `/mnt` directory in Linux. E.g., WSL maps the C hard drive to the `/mnt/c` directory. That means you can access your Windows User directory in `/mnt/c/Users/<WINDOWS_USERNAME>`.

The Windows Explorer can also access the Linux filesystem. To illustrate this integration, open an Ubuntu console and navigate to a directory of your choice. To view this location in Windows Explorer, use the `explorer.exe` command (do not forget the final dot!).

Compiling LAMMPS

You now have a fully functioning Ubuntu installation and can follow most guides to install LAMMPS on a Linux system. Here are some of the essential steps to follow:

Install prerequisite packages

Before we can begin, we need to download the necessary compiler toolchain and libraries to compile LAMMPS. In our Ubuntu-based Linux installation, we will use the `apt` package manager to install additional packages.

First, upgrade all existing packages using `apt update` and `apt upgrade`.

```bash
sudo apt update
sudo apt upgrade -y
```

Next, install the following packages with `apt install`:

```bash
sudo apt install -y cmake build-essential ccache gfortran openmpi-bin libopenmpi-dev \
libfftw3-dev libjpeg-dev libpng-dev python3-dev python3-pip \
python3-virtualenv libblas-dev liblapack-dev libhdf5-serial-dev \
hdf5-tools
```

8.1. Tutorials howto 219
Download LAMMPS

Obtain a copy of the LAMMPS source code and go into it using the `cd` command.

**Option 1: Download a LAMMPS tarball using wget**

```
tar xvzf stable_3Mar2020.tar.gz
cd lammps
```

**Option 2: Download a LAMMPS development version from GitHub**

```
git clone --depth=1 https://github.com/lammps/lammps.git
cd lammps
```

Configure and Compile LAMMPS with CMake

A beginner-friendly way to compile LAMMPS is to use CMake. Create a `build` directory to compile LAMMPS and move into it. This directory will store the build configuration and any binaries generated during compilation.

```
mkdir build
cd build
```

There are countless ways to compile LAMMPS. It is beyond the scope of this tutorial. If you want to find out more about what can be enabled, please consult the extensive documentation.

To compile a minimal version of LAMMPS, we’re going to use a preset. Presets are a way to specify a collection of CMake options using a file.

```
cmake ../cmake/presets/minimal.cmake ../cmake
```

This command configures the build and generates the necessary Makefiles. To compile the binary, run the `make` command.

```
make -j 4
```

The `-j` option specifies how many parallel processes will perform the compilation. This option can significantly speed up compilation times. Use a number that corresponds to the number of processors in your system.

After the compilation completes successfully, you will have an executable called `lmp` in the `build` directory.
Please take note of the absolute path of your build directory. You will need to know the location to execute the LAMMPS binary later.

One way of getting the absolute path of the current directory is through the $PWD variable:

```
# prints out the current value of the PWD variable
echo $PWD
```

Let us save this value in a temporary variable LAMMPS_BUILD_DIR for future use:

```
LAMMPS_BUILD_DIR=$PWD
```

The full path of the LAMMPS binary then is $LAMMPS_BUILD_DIR/lmp.

### Running an example script

Now that we have a LAMMPS binary, we will run a script from the examples folder.

Switch into the examples/melt folder:

```
cd ../examples/melt
```

To run this example in serial, use the following command line:

```
$LAMMPS_BUILD_DIR/lmp -in in.melt
```

To run the same script in parallel using MPI with 4 processes, do the following:

```
mpirun -np 4 $LAMMPS_BUILD_DIR/lmp -in in.melt
```

If you run LAMMPS for the first time, the Windows Firewall might prompt you to confirm access. LAMMPS is accessing the network stack to enable parallel computation. Allow the access.

In either serial or MPI case, LAMMPS executes and will output something similar to this:

```
LAMMPS (30 Jun 2020)
...
...
...
Total # of neighbors = 151513
```

(continues on next page)
Ave neighs/atom = 37.878250
Neighbor list builds = 12
Dangerous builds not checked
Total wall time: 0:00:00

Congratulations! You’ve successfully compiled and executed LAMMPS on WSL!

Final steps

It is cumbersome to always specify the path of your LAMMPS binary. You can avoid this by adding the absolute path of your build directory to your PATH environment variable.

```
export PATH=$LAMMPS_BUILD_DIR:$PATH
```

You can then run LAMMPS input scripts like this:

```
lmp -in in.melt
```

or

```
mpirun -np 4 lmp -in in.melt
```

Note: The value of this PATH variable will disappear once you close your console window. To persist this setting edit the $HOME/.bashrc file using your favorite text editor and add this line:

```
export PATH=/full/path/to/your/lammps/build:$PATH
```

Example: If the LAMMPS executable lmp has the following absolute path:

```
/home/<USERNAME>/lammps/build/lmp
```

the PATH variable should be:

```
export PATH=/home/<USERNAME>/lammps/build:$PATH
```

Once set up, all your Ubuntu consoles will always have access to your lmp binary without having to specify its location.

Conclusion

I hope this gives you good overview on how to start compiling and running LAMMPS on Windows. WSL makes preparing and running scripts on Windows a much better experience.

If you are completely new to Linux, I highly recommend investing some time in studying Linux online tutorials. E.g., tutorials about Bash Shell and Basic Unix commands (e.g., Linux Journey). Acquiring these skills will make you much more productive in this environment.

8.2 General howto

8.2.1 Restart a simulation

There are 3 ways to continue a long LAMMPS simulation. Multiple run commands can be used in the same input script. Each run will continue from where the previous run left off. Or binary restart files can be saved to disk using the restart command. At a later time, these binary files can be read via a read_restart command in a new script. Or they can be converted to text data files using the -r command-line switch and read by a read_data command in a new script.

Here we give examples of 2 scripts that read either a binary restart file or a converted data file and then issue a new run command to continue where the previous run left off. They illustrate what settings must be made in the new script. Details are discussed in the documentation for the read_restart and read_data commands.

Look at the in.chain input script provided in the bench directory of the LAMMPS distribution to see the original script that these 2 scripts are based on. If that script had the line

```
restart 50 tmp.restart
```

added to it, it would produce 2 binary restart files (tmp.restart.50 and tmp.restart.100) as it ran.

This script could be used to read the first restart file and re-run the last 50 timesteps:

```
read_restart tmp.restart.50
neighbor 0.4 bin
neigh_modify every 1 delay 1
fix 1 all nve
fix 2 all langevin 1.0 1.0 10.0 904297
timestep 0.012
run 50
```

Note that the following commands do not need to be repeated because their settings are included in the restart file: units, atom_style, special_bonds, pair_style, bond_style. However these commands do need to be used, since their settings are not in the restart file: neighbor, fix, timestep.

If you actually use this script to perform a restarted run, you will notice that the thermodynamic data match at step 50 (if you also put a “thermo 50” command in the original script), but do not match at step 100. This is because the fix langevin command uses random numbers in a way that does not allow for perfect restarts.

As an alternate approach, the restart file could be converted to a data file as follows:

```
lmp_g++ -r tmp.restart.50 tmp.restart.data
```

Then, this script could be used to re-run the last 50 steps:

```
units lj
atom_style bond
pair_style lj/cut 1.12
pair_modify shift yes
bond_style fene
special_bonds 0.0 1.0 1.0
read_data tmp.restart.data
```

(continues on next page)
neighbor 0.4 bin
neigh_modify every 1 delay 1
fix 1 all nve
fix 2 all langevin 1.0 1.0 10.0 904297
timestep 0.012
reset_timestep 50
run 50

Note that nearly all the settings specified in the original `in.chain` script must be repeated, except the `pair_coeff` and `bond_coeff` commands since the new data file lists the force field coefficients. Also, the `reset_timestep` command is used to tell LAMMPS the current timestep. This value is stored in restart files, but not in data files.

### 8.2.2 Visualize LAMMPS snapshots

LAMMPS itself does not do visualization, but snapshots from LAMMPS simulations can be visualized (and analyzed) in a variety of ways.

Mention `dump image` and `dump movie`.

LAMMPS snapshots are created by the `dump` command which can create files in several formats. The native LAMMPS dump format is a text file (see “dump atom” or “dump custom”) which can be visualized by several popular visualization tools. The `dump image` and `dump movie` styles can output internally rendered images and convert a sequence of them to a movie during the MD run. Several programs included with LAMMPS as auxiliary tools can convert between LAMMPS format files and other formats. See the `Tools` doc page for details.

A Python-based toolkit distributed by our group can read native LAMMPS dump files, including custom dump files with additional columns of user-specified atom information, and convert them to various formats or pipe them into visualization software directly. See the Pizza.py WWW site for details. Specifically, Pizza.py can convert LAMMPS dump files into PDB, XYZ, EnSight, and VTK formats. Pizza.py can pipe LAMMPS dump files directly into the Raster3d and RasMol visualization programs. Pizza.py has tools that do interactive 3d OpenGL visualization and one that creates SVG images of dump file snapshots.

### 8.2.3 Run multiple simulations from one input script

This can be done in several ways. See the documentation for individual commands for more details on how these examples work.

If “multiple simulations” means continue a previous simulation for more timesteps, then you simply use the `run` command multiple times. For example, this script

```plaintext
units lj
atom_style atomic
read_data data.lj
run 10000
run 10000
run 10000
run 10000
run 10000
```

would run 5 successive simulations of the same system for a total of 50,000 timesteps.
If you wish to run totally different simulations, one after the other, the `clear` command can be used in between them to re-initialize LAMMPS. For example, this script

```plaintext
units lj
atom_style atomic
read_data data.lj
run 10000
clear
units lj
atom_style atomic
read_data data.lj.new
run 10000
```

would run 2 independent simulations, one after the other.

For large numbers of independent simulations, you can use `variables` and the `next` and `jump` commands to loop over the same input script multiple times with different settings. For example, this script, named `in.polymer`

```plaintext
variable d index run1 run2 run3 run4 run5 run6 run7 run8
shell cd $d
read_data data.polymer
run 10000
shell cd ..
clear
next d
jump in.polymer
```

would run 8 simulations in different directories, using a `data.polymer` file in each directory. The same concept could be used to run the same system at 8 different temperatures, using a temperature variable and storing the output in different log and dump files, for example

```plaintext
variable a loop 8
variable t index 0.8 0.85 0.9 0.95 1.0 1.05 1.1 1.15
log log.$a
read data.polymer
velocity all create $t 352839
fix 1 all nvt $t $t 100.0
dump 1 all atom 1000 dump.$a
run 100000
clear
next t
next a
jump in.polymer
```

All of the above examples work whether you are running on 1 or multiple processors, but assumed you are running LAMMPS on a single partition of processors. LAMMPS can be run on multiple partitions via the `-partition command-line switch.`

In the last 2 examples, if LAMMPS were run on 3 partitions, the same scripts could be used if the “index” and “loop” variables were replaced with `universe-style` variables, as described in the `variable` command. Also, the “next t” and “next a” commands would need to be replaced with a single “next a t” command. With these modifications, the 8 simulations of each script would run on the 3 partitions one after the other until all were finished. Initially, 3 simulations would be started simultaneously, one on each partition. When one finished, that partition would then start the fourth simulation, and so forth, until all 8 were completed.
8.2.4 Multi-replica simulations

Several commands in LAMMPS run multi-replica simulations, meaning that multiple instances (replicas) of your simulation are run simultaneously, with small amounts of data exchanged between replicas periodically.

These are the relevant commands:

- `neb` for nudged elastic band calculations
- `neb_spin` for magnetic nudged elastic band calculations
- `prd` for parallel replica dynamics
- `tad` for temperature accelerated dynamics
- `temper` for parallel tempering
- `fix pimd` for path-integral molecular dynamics (PIMD)

NEB is a method for finding transition states and barrier energies. PRD and TAD are methods for performing accelerated dynamics to find and perform infrequent events. Parallel tempering or replica exchange runs different replicas at a series of temperature to facilitate rare-event sampling.

These commands can only be used if LAMMPS was built with the REPLICA package. See the Build package doc page for more info.

PIMD runs different replicas whose individual particles are coupled together by springs to model a system or ring-polymers.

This commands can only be used if LAMMPS was built with the USER-MISC package. See the Build package doc page for more info.

In all these cases, you must run with one or more processors per replica. The processors assigned to each replica are determined at run-time by using the `partition` command-line switch to launch LAMMPS on multiple partitions, which in this context are the same as replicas. E.g. these commands:

```
mpirun -np 16 lmp_linux -partition 8x2 -in in.temper
mpirun -np 8 lmp_linux -partition 8x1 -in in.neb
```

would each run 8 replicas, on either 16 or 8 processors. Note the use of the `-in` command-line switch to specify the input script which is required when running in multi-replica mode.

Also note that with MPI installed on a machine (e.g. your desktop), you can run on more (virtual) processors than you have physical processors. Thus the above commands could be run on a single-processor (or few-processor) desktop so that you can run a multi-replica simulation on more replicas than you have physical processors.

8.2.5 Library interface to LAMMPS

As described on the Build basics doc page, LAMMPS can be built as a static or shared library, so that it can be called by another code, used in a coupled manner with other codes, or driven through a Python interface.

At the core of LAMMPS is the LAMMPS class which encapsulates the state of the simulation program through the state of the various class instances that it is composed of. So a calculation using LAMMPS requires to create an instance of the LAMMPS class and then send it (text) commands, either individually or from a file, or perform other operations that modify the state stored inside that instance or drive simulations. This is essentially what the src/main.cpp file does as well for the standalone LAMMPS executable with reading commands either from an input file or stdin.

Creating a LAMMPS instance can be done by using C++ code directly or through a C-style interface library to LAMMPS that is provided in the files src/library.cpp and library.h. This C language API, can be used from C and C++, and is also the basis for the Python and Fortran interfaces or wrappers included in the LAMMPS source code.
The `examples/COUPLE` and `python/examples` directories contain some example programs written in C++, C, Fortran, and Python, which show how a driver code can link to LAMMPS as a library, run LAMMPS on a subset of processors (so the others are available to run some other code concurrently), grab data from LAMMPS, change it, and send it back into LAMMPS.

A detailed documentation of the available APIs and examples of how to use them can be found in the *Programmer Documentation* section of this manual.

### 8.2.6 Coupling LAMMPS to other codes

LAMMPS is designed to allow it to be coupled to other codes. For example, a quantum mechanics code might compute forces on a subset of atoms and pass those forces to LAMMPS. Or a continuum finite element (FE) simulation might use atom positions as boundary conditions on FE nodal points, compute a FE solution, and return interpolated forces on MD atoms.

LAMMPS can be coupled to other codes in at least 4 ways. Each has advantages and disadvantages, which you will have to think about in the context of your application.

1. Define a new *fix* command that calls the other code. In this scenario, LAMMPS is the driver code. During timestepping, the fix is invoked, and can make library calls to the other code, which has been linked to LAMMPS as a library. This is the way how the *LATTE* package, which performs density-functional tight-binding calculations using the *LATTE* software to compute forces, is hooked to LAMMPS. See the *fix latte* command for more details. Also see the *Modify* doc pages for info on how to add a new fix to LAMMPS.

2. Define a new LAMMPS command that calls the other code. This is conceptually similar to method (1), but in this case LAMMPS and the other code are on a more equal footing. Note that now the other code is not called during the timestepping of a LAMMPS run, but between runs. The LAMMPS input script can be used to alternate LAMMPS runs with calls to the other code, invoked via the new command. The *run* command facilitates this with its *every* option, which makes it easy to run a few steps, invoke the command, run a few steps, invoke the command, etc.

   In this scenario, the other code can be called as a library, as in 1., or it could be a stand-alone code, invoked by a `system()` call made by the command (assuming your parallel machine allows one or more processors to start up another program). In the latter case the stand-alone code could communicate with LAMMPS through files that the command writes and reads.

   See the *Modify command* doc page for info on how to add a new command to LAMMPS.

3. Use LAMMPS as a library called by another code. In this case the other code is the driver and calls LAMMPS as needed. Or a wrapper code could link and call both LAMMPS and another code as libraries. Again, the *run* command has options that allow it to be invoked with minimal overhead (no setup or clean-up) if you wish to do multiple short runs, driven by another program. Details about using the library interface are given in the *library API* documentation.

4. Couple LAMMPS with another code in a client/server mode. This is described on the *Howto client/server* doc page.
8.2.7 Using LAMMPS in client/server mode

Client/server coupling of two codes is where one code is the “client” and sends request messages to a “server” code. The server responds to each request with a reply message. This enables the two codes to work in tandem to perform a simulation. LAMMPS can act as either a client or server code.

Some advantages of client/server coupling are that the two codes run as stand-alone executables; they are not linked together. Thus neither code needs to have a library interface. This often makes it easier to run the two codes on different numbers of processors. If a message protocol (format and content) is defined for a particular kind of simulation, then in principle any code that implements the client-side protocol can be used in tandem with any code that implements the server-side protocol, without the two codes needing to know anything more specific about each other.

A simple example of client/server coupling is where LAMMPS is the client code performing MD timestepping. Each timestep it sends a message to a server quantum code containing current coords of all the atoms. The quantum code computes energy and forces based on the coords. It returns them as a message to LAMMPS, which completes the timestep.

A more complex example is where LAMMPS is the client code and processes a series of data files, sending each configuration to a quantum code to compute energy and forces. Or LAMMPS runs dynamics with an atomistic force field, but pauses every N steps to ask the quantum code to compute energy and forces.

Alternate methods for code coupling with LAMMPS are described on the Howto couple doc page.

The protocol for using LAMMPS as a client is to use these 3 commands in this order (other commands may come in between):

- `message client` # initiate client/server interaction
- `fix client/md` # any client fix which makes specific requests to the server
- `message quit` # terminate client/server interaction

In between the two message commands, a client fix command and `unfix` command can be used multiple times. Similarly, this sequence of 3 commands can be repeated multiple times, assuming the server program operates in a similar fashion, to initiate and terminate client/server communication.

The protocol for using LAMMPS as a server is to use these 2 commands in this order (other commands may come in between):

- `message server` # initiate client/server interaction
- `server md` # any server command which responds to specific requests from the client

This sequence of 2 commands can be repeated multiple times, assuming the client program operates in a similar fashion, to initiate and terminate client/server communication.

LAMMPS support for client/server coupling is in its MESSAGE package which implements several commands that enable LAMMPS to act as a client or server, as discussed below. The MESSAGE package also wraps a client/server library called CSlib which enables two codes to exchange messages in different ways, either via files, sockets, or MPI. The CSlib is provided with LAMMPS in the lib/message dir. The CSlib has its own website with documentation and test programs.

Note: For client/server coupling to work between LAMMPS and another code, the other code also has to use the CSlib. This can sometimes be done without any modifications to the other code by simply wrapping it with a Python script that exchanges CSlib messages with LAMMPS and prepares input for or processes output from the other code. The other code also has to implement a matching protocol for the format and content of messages that LAMMPS exchanges with it.

These are the commands currently in the MESSAGE package for two protocols, MD and MC (Monte Carlo). New protocols can easily be defined and added to this directory, where LAMMPS acts as either the client or server.
• message

• fix client md = LAMMPS is a client for running MD
• server md = LAMMPS is a server for computing MD forces
• server mc = LAMMPS is a server for computing a Monte Carlo energy

The server doc files give details of the message protocols for data that is exchanged between the client and server.

These example directories illustrate how to use LAMMPS as either a client or server code:

• examples/message
• examples/COUPLE/README
• examples/COUPLE/lammps_mc
• examples/COUPLE/lammps_nwchem
• examples/COUPLE/lammps_vasp

The examples/message directory couples a client instance of LAMMPS to a server instance of LAMMPS.

The files in the lammps_mc folder show how to couple LAMMPS as a server to a simple Monte Carlo client code as the driver.

The files in the lammps_nwchem folder show how to couple LAMMPS as a client code running MD timestepping to NWChem acting as a server providing quantum DFT forces, through a Python wrapper script on NWChem.

The files in the lammps_vasp folder show how to couple LAMMPS as a client code running MD timestepping to VASP acting as a server providing quantum DFT forces, through a Python wrapper script on VASP.

Here is how to launch a client and server code together for any of the 4 modes of message exchange that the message command and the CSlib support. Here LAMMPS is used as both the client and server code. Another code could be substituted for either.

The examples below show launching both codes from the same window (or batch script), using the “&” character to launch the first code in the background. For all modes except mpi/one, you could also launch the codes in separate windows on your desktop machine. It does not matter whether you launch the client or server first.

In these examples either code can be run on one or more processors. If running in a non-MPI mode (file or zmq) you can launch a code on a single processor without using mpirun.

IMPORTANT: If you run in mpi/two mode, you must launch both codes via mpirun, even if one or both of them runs on a single processor. This is so that MPI can figure out how to connect both MPI processes together to exchange MPI messages between them.

For message exchange in file, zmq, or mpi/two modes:

```
% mpirun -np 1 lmp_mpi -log log.client < in.client &
% mpirun -np 2 lmp_mpi -log log.server < in.server
% mpirun -np 4 lmp_mpi -log log.client < in.client &
% mpirun -np 1 lmp_mpi -log log.server < in.server
% mpirun -np 2 lmp_mpi -log log.client < in.client &
% mpirun -np 4 lmp_mpi -log log.server < in.server
```

For message exchange in mpi/one mode:

Launch both codes in a single mpirun command:

```
mpirun -np 2 lmp_mpi -mpicolor 0 -in in.message.client -log log.client : -np 4 lmp_mpi -mpicolor 1 -in in.message.server -log log.server
```
The two -np values determine how many procs the client and the server run on.

A LAMMPS executable run in this manner must use the -mpicolor color command-line option as their its option, where color is an integer label that will be used to distinguish one executable from another in the multiple executables that the mpirun command launches. In this example the client was colored with a 0, and the server with a 1.

8.3 Settings howto

8.3.1 2d simulations

Use the dimension command to specify a 2d simulation.

Make the simulation box periodic in z via the boundary command. This is the default.

If using the create_box command to define a simulation box, set the z dimensions narrow, but finite, so that the create_atoms command will fill the 3d simulation box with a single z plane of atoms - e.g.

```
create box 1 -10 10 -10 10 -0.25 0.25
```

If using the read data command to read in a file of atom coordinates, set the “zlo zhi” values to be finite but narrow, similar to the create_box command settings just described. For each atom in the file, assign a z coordinate so it falls inside the z-boundaries of the box - e.g. 0.0.

Use the fix enforce2d command as the last defined fix to insure that the z-components of velocities and forces are zeroed out every timestep. The reason to make it the last fix is so that any forces induced by other fixes will be zeroed out.

Many of the example input scripts included in the LAMMPS distribution are for 2d models.

Note: Some models in LAMMPS treat particles as finite-size spheres, as opposed to point particles. See the atom_style sphere and fix nve/sphere commands for details. By default, for 2d simulations, such particles will still be modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be that of a sphere. If you wish to model them as 2d discs, see the set density/disc command and the disc option for the fix nve/sphere, fix nvt/sphere, fix nph/sphere, fix npt/sphere commands.

8.3.2 Triclinic (non-orthogonal) simulation boxes

By default, LAMMPS uses an orthogonal simulation box to encompass the particles. The boundary command sets the boundary conditions of the box (periodic, non-periodic, etc). The orthogonal box has its “origin” at (xlo,ylo,zlo) and is defined by 3 edge vectors starting from the origin given by a = (xhi-xlo,0,0); b = (0,yhi-ylo,0); c = (0,0,zhi-zlo). The 6 parameters (xlo,xhi,ylo,yhi,zlo,zhi) are defined at the time the simulation box is created, e.g. by the create_box or read_data or read_restart commands. Additionally, LAMMPS defines box size parameters lx,ly,lz where lx = xhi-xlo, and similarly in the y and z dimensions. The 6 parameters, as well as lx,ly,lz, can be output via the thermo_style custom command.

LAMMPS also allows simulations to be performed in triclinic (non-orthogonal) simulation boxes shaped as a parallelepiped with triclinic symmetry. The parallelepiped has its “origin” at (xlo,ylo,zlo) and is defined by 3 edge vectors starting from the origin given by a = (xhi-xlo,0,0); b = (xy,yhi-ylo,0); c = (xz,yz,zhi-zlo). xy,xy,yc can be 0.0 or positive or negative values and are called “tilt factors” because they are the amount of displacement applied to faces of an originally orthogonal box to transform it into the parallelepiped. In LAMMPS the triclinic simulation box edge vectors a, b, and c cannot be arbitrary vectors. As indicated, a must lie on the positive x axis. b must lie in the xy plane, with strictly positive y component. c may have any orientation with strictly positive z component. The requirement that a, b, and c have strictly positive x, y, and z components, respectively, ensures that a, b, and c form a complete
right-handed basis. These restrictions impose no loss of generality, since it is possible to rotate/invert any set of 3 crystal basis vectors so that they conform to the restrictions.

For example, assume that the 3 vectors \( \mathbf{A}, \mathbf{B}, \mathbf{C} \) are the edge vectors of a general parallelepiped, where there is no restriction on \( \mathbf{A}, \mathbf{B}, \mathbf{C} \) other than they form a complete right-handed basis i.e. \( \mathbf{A} \times \mathbf{B} \cdot \mathbf{C} > 0 \). The equivalent LAMMPS \( \mathbf{a}, \mathbf{b}, \mathbf{c} \) are a linear rotation of \( \mathbf{A}, \mathbf{B}, \mathbf{C} \) and can be computed as follows:

\[
\begin{align*}
(a & \ b & \ c) = \\
( & a_x & b_x & c_x) = \\
(0 & 0 & 0 & c_z) \\
A &= \mathbf{a} \\
B &= \mathbf{b} \cdot \hat{A} = B \cos \gamma \\
b_y &= |\hat{A} \times \mathbf{B}| = B \sin \gamma = \sqrt{B^2 - b_x^2} \\
c_x &= \mathbf{C} \cdot \hat{A} = C \cos \beta \\
c_y &= \mathbf{C} \cdot (\mathbf{A} \times \mathbf{B}) \times \hat{A} = \frac{\mathbf{B} \cdot \mathbf{C} - b_x c_z}{b_y} \\
c_z &= |\mathbf{C} \cdot (\mathbf{A} \times \mathbf{B})| = \sqrt{C^2 - c_x^2 - c_y^2}
\end{align*}
\]

where \( A = \| \mathbf{A} \| \) indicates the scalar length of \( \mathbf{A} \). The hat symbol (^) indicates the corresponding unit vector. \( \beta \) and \( \gamma \) are angles between the vectors described below. Note that by construction, \( \mathbf{a}, \mathbf{b}, \mathbf{c} \) have strictly positive \( x, y, \) and \( z \) components, respectively. If it should happen that \( \mathbf{A}, \mathbf{B}, \) and \( \mathbf{C} \) form a left-handed basis, then the above equations are not valid for \( \mathbf{c} \). In this case, it is necessary to first apply an inversion. This can be achieved by interchanging two basis vectors or by changing the sign of one of them.

For consistency, the same rotation/inversion applied to the basis vectors must also be applied to atom positions, velocities, and any other vector quantities. This can be conveniently achieved by first converting to fractional coordinates in the old basis and then converting to distance coordinates in the new basis. The transformation is given by the following equation:

\[
x = (a \ b \ c) \cdot \frac{1}{V} \left( \begin{array}{c}
\mathbf{B} \\
\mathbf{C} \\
\mathbf{A} \\
\mathbf{A} \times \mathbf{B}
\end{array} \right) \cdot \mathbf{X}
\]

where \( V \) is the volume of the box, \( \mathbf{X} \) is the original vector quantity and \( \mathbf{x} \) is the vector in the LAMMPS basis.

There is no requirement that a triclinic box be periodic in any dimension, though it typically should be in at least the second dimension of the tilt \( (y \text{ in } xy) \) if you want to enforce a shift in periodic boundary conditions across that boundary. Some commands that work with triclinic boxes, e.g. the \texttt{fix deform} and \texttt{fix npt} commands, require periodicity or non-shrink-wrap boundary conditions in specific dimensions. See the command doc pages for details.

The 9 parameters \( (\text{xlo}, \text{xhi}, \text{ylo}, \text{yhi}, \text{zlo}, \text{zhi}, \text{xy}, \text{xz}, \text{yz}) \) are defined at the time the simulation box is created. This happens in one of 3 ways. If the \texttt{create_box} command is used with a region of style \texttt{prism}, then a triclinic box is setup. See the \texttt{region} command for details. If the \texttt{read_data} command is used to define the simulation box, and the header of the data file contains a line with the “\texttt{xy} xy \texttt{xz} yz” keyword, then a triclinic box is setup. See the \texttt{read_data} command for details. Finally, if the \texttt{read_restart} command reads a restart file which was written from a simulation using a triclinic box, then a triclinic box will be setup for the restarted simulation.

Note that you can define a triclinic box with all 3 tilt factors \( = 0.0 \), so that it is initially orthogonal. This is necessary if the box will become non-orthogonal, e.g. due to the \texttt{fix npt} or \texttt{fix deform} commands. Alternatively, you can use the \texttt{change_box} command to convert a simulation box from orthogonal to triclinic and vice versa.

As with orthogonal boxes, LAMMPS defines triclinic box size parameters \( l_x, l_y, l_z \) where \( l_x = x_{hi} - x_{lo} \), and similarly in the \( y \) and \( z \) dimensions. The 9 parameters, as well as \( l_x, l_y, l_z \), can be output via the \texttt{thermo_style custom} command.

To avoid extremely tilted boxes (which would be computationally inefficient), LAMMPS normally requires that no tilt factor can skew the box more than half the distance of the parallel box length, which is the first dimension in the
LAMMPS Documentation

tilt factor (x for xz). This is required both when the simulation box is created, e.g. via the `create_box` or `read_data` commands, as well as when the box shape changes dynamically during a simulation, e.g. via the `fix deform` or `fix npt` commands.

For example, if xlo = 2 and xhi = 12, then the x box length is 10 and the xy tilt factor must be between -5 and 5. Similarly, both xz and yz must be between -(xhi-xlo)/2 and +(yhi-ylo)/2. Note that this is not a limitation, since if the maximum tilt factor is 5 (as in this example), then configurations with tilt = . . . , -15, -5, 5, 15, 25, . . . are geometrically all equivalent. If the box tilt exceeds this limit during a dynamics run (e.g. via the `fix deform` command), then the box is “flipped” to an equivalent shape with a tilt factor within the bounds, so the run can continue. See the `fix deform` doc page for further details.

One exception to this rule is if the first dimension in the tilt factor (x for xy) is non-periodic. In that case, the limits on the tilt factor are not enforced, since flipping the box in that dimension does not change the atom positions due to non-periodicity. In this mode, if you tilt the system to extreme angles, the simulation will simply become inefficient, due to the highly skewed simulation box.

The limitation on not creating a simulation box with a tilt factor skewing the box more than half the distance of the parallel box length can be overridden via the `box` command. Setting the `tilt` keyword to `large` allows any tilt factors to be specified.

Box flips that may occur using the `fix deform` or `fix npt` commands can be turned off using the `flip no` option with either of the commands.

Note that if a simulation box has a large tilt factor, LAMMPS will run less efficiently, due to the large volume of communication needed to acquire ghost atoms around a processor’s irregular-shaped sub-domain. For extreme values of tilt, LAMMPS may also lose atoms and generate an error.

Triclinic crystal structures are often defined using three lattice constants a, b, and c, and three angles α, β, and γ. Note that in this nomenclature, the a, b, and c lattice constants are the scalar lengths of the edge vectors \(\mathbf{a}, \mathbf{b}, \text{ and } \mathbf{c}\) defined above. The relationship between these 6 quantities (a, b, c, α, β, γ) and the LAMMPS box sizes (lx,ly,lz) = (xhi-xlo,yhi-ylo,zhi-zlo) and tilt factors (xy,xz,yz) is as follows:

\[
\begin{align*}
a &= l_x \\
b^2 &= l_y^2 + xy^2 \\
c^2 &= l_z^2 + xz^2 + yz^2 \\
\cos \alpha &= \frac{xy \ast xz + ly \ast yz}{b \ast c} \\
\cos \beta &= \frac{xz}{c} \\
\cos \gamma &= \frac{xy}{b}
\end{align*}
\]

The inverse relationship can be written as follows:

\[
\begin{align*}
l_x &= a \\
xy &= b \cos \gamma \\
xz &= c \cos \beta \\
l_y^2 &= b^2 - xy^2 \\
yz &= \frac{b \ast c \cos \alpha - xy \ast xz}{ly} \\
l_z^2 &= c^2 - xz^2 - yz^2
\end{align*}
\]

The values of a, b, c, α, β, and γ can be printed out or accessed by computes using the `thermo_style custom` keywords `cella`, `cellb`, `celle`, `cellalpha`, `cellbeta`, `cellgamma`, respectively.

As discussed on the `dump` command doc page, when the BOX BOUNDS for a snapshot is written to a dump file for a triclinic box, an orthogonal bounding box which encloses the triclinic simulation box is output, along with the 3 tilt factors (xy, xz, yz) of the triclinic box, formatted as follows:
ITEM: BOX BOUNDS xy xz yz
xlo_bound xhi_bound xy
ylo_bound yhi_bound xz
zlo_bound zhi_bound yz

This bounding box is convenient for many visualization programs and is calculated from the 9 triclinic box parameters (xlo,xhi,ylo,yhi,zlo,zhi,xy,xz,yz) as follows:

\[
\begin{align*}
\text{xlo\_bound} &= \text{xlo} + \text{MIN}(0.0, \text{xy}, \text{xz}, \text{xy} + \text{xz}) \\
\text{xhi\_bound} &= \text{xhi} + \text{MAX}(0.0, \text{xy}, \text{xz}, \text{xy} + \text{xz}) \\
\text{ylo\_bound} &= \text{ylo} + \text{MIN}(0.0, \text{yz}) \\
\text{yhi\_bound} &= \text{yhi} + \text{MAX}(0.0, \text{yz}) \\
\text{zlo\_bound} &= \text{zlo} \\
\text{zhi\_bound} &= \text{zhi}
\end{align*}
\]

These formulas can be inverted if you need to convert the bounding box back into the triclinic box parameters, e.g. \( \text{xlo} = \text{xlo\_bound} - \text{MIN}(0.0, \text{xy}, \text{xz}, \text{xy} + \text{xz}) \).

One use of triclinic simulation boxes is to model solid-state crystals with triclinic symmetry. The \text{lattice} command can be used with non-orthogonal basis vectors to define a lattice that will tile a triclinic simulation box via the \text{create\_atoms} command.

A second use is to run Parrinello-Rahman dynamics via the \text{fix npt} command, which will adjust the \( \text{xy}, \text{xz}, \text{yz} \) tilt factors to compensate for off-diagonal components of the pressure tensor. The analog for an \text{energy minimization} is the \text{fix box/relax} command.

A third use is to shear a bulk solid to study the response of the material. The \text{fix deform} command can be used for this purpose. It allows dynamic control of the \( \text{xy}, \text{xz}, \text{yz} \) tilt factors as a simulation runs. This is discussed in the next section on non-equilibrium MD (NEMD) simulations.

### 8.3.3 Thermostats

Thermostatting means controlling the temperature of particles in an MD simulation. \text{Barostatting} means controlling the pressure. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Thermostatting in LAMMPS is performed by \text{fixes}, or in one case by a pair style. Several thermostatting fixes are available: Nose-Hoover (nvt), Berendsen, CSVR, Langevin, and direct rescaling (temp/rescale). Dissipative particle dynamics (DPD) thermostatting can be invoked via the \text{dpd/tstat} pair style:

- \text{fix nvt}
- \text{fix nvt/sphere}
- \text{fix nvt/asphere}
- \text{fix nvt/sllod}
- \text{fix temp/berendsen}
- \text{fix temp/csvr}
- \text{fix langevin}
- \text{fix temp/rescale}
- \text{pair\_style dpd/tstat}
**Fix nvt** only thermostats the translational velocity of particles. **Fix nvt/sllod** also does this, except that it subtracts out a velocity bias due to a deforming box and integrates the SLLOD equations of motion. See the Howto nemd doc page for further details. **Fix nvt/sphere** and **fix nvt/asphere** thermostat not only translation velocities but also rotational velocities for spherical and aspherical particles.

**Note:** A recent (2017) book by [Daivis and Todd](#) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostatting generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

DPD thermostatting alters pairwise interactions in a manner analogous to the per-particle thermostatting of **fix langevin**. Any of the thermostatting fixes can be instructed to use custom temperature computes that remove bias which has two effects: first, the current calculated temperature, which is compared to the requested target temperature, is calculated with the velocity bias removed; second, the thermostat adjusts only the thermal temperature component of the particle’s velocities, which are the velocities with the bias removed. The removed bias is then added back to the adjusted velocities. See the doc pages for the individual fixes and for the **fix_modify** command for instructions on how to assign a temperature compute to a thermostatting fix. For example, you can apply a thermostat to only the x and z components of velocity by using it in conjunction with **compute temp/partial**. Of you could thermostat only the thermal temperature of a streaming flow of particles without affecting the streaming velocity, by using **compute temp/profile**.

Below is a list of some custom temperature computes that can be used like that:

- `compute temp/asphere command`
- `compute temp/body command`
- `compute temp/chunk command`
- `compute temp/com command`
- `compute temp/deform command`
- `compute temp/partial command`
- `compute temp/profile command`
- `compute temp/ramp command`
- `compute temp/region command`
- `compute temp/rotate command`
- `compute temp/sphere command`

**Note:** Only the nvt fixes perform time integration, meaning they update the velocities and positions of particles due to forces and velocities respectively. The other thermostat fixes only adjust velocities; they do NOT perform time integration updates. Thus they should be used in conjunction with a constant NVE integration fix such as these:

- `fix nve`
- `fix nve/sphere`
- `fix nve/asphere`

Thermodynamic output, which can be setup via the **thermo_style** command, often includes temperature values. As explained on the doc page for the **thermo_style** command, the default temperature is setup by the thermo command itself. It is NOT the temperature associated with any thermostatting fix you have defined or with any compute you have defined that calculates a temperature. The doc pages for the thermostatting fixes explain the ID of the temperature compute they create. Thus if you want to view these temperatures, you need to specify them explicitly via the
thermo_style custom command. Or you can use the thermo_modify command to re-define what temperature compute is used for default thermodynamic output.

8.3.4 Barostats

Barostatting means controlling the pressure in an MD simulation. Thermostatting means controlling the temperature of the particles. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Barostatting in LAMMPS is performed by fixes. Two barostatting methods are currently available: Nose-Hoover (npt and nph) and Berendsen:

- fix npt
- fix npt/sphere
- fix npt/asphere
- fix nph
- fix press/berendsen

The fix npt commands include a Nose-Hoover thermostat and barostat. Fix nph is just a Nose/Hoover barostat; it does no thermostatting. Both fix nph and fix press/berendsen can be used in conjunction with any of the thermostatting fixes.

As with the thermostats, fix npt and fix nph only use translational motion of the particles in computing T and P and performing thermo/barostatting. Fix npt/sphere and fix npt/asphere thermo/barostat using not only translation velocities but also rotational velocities for spherical and aspherical particles.

All of the barostatting fixes use the compute pressure compute to calculate a current pressure. By default, this compute is created with a simple compute temp (see the last argument of the compute pressure command), which is used to calculated the kinetic component of the pressure. The barostatting fixes can also use temperature computes that remove bias for the purpose of computing the kinetic component which contributes to the current pressure. See the doc pages for the individual fixes and for the fix_modify command for instructions on how to assign a temperature or pressure compute to a barostatting fix.

Note: As with the thermostats, the Nose/Hoover methods (fix npt and fix nph) perform time integration. Fix press/berendsen does NOT, so it should be used with one of the constant NVE fixes or with one of the NVT fixes.

Thermodynamic output, which can be setup via the thermo_style command, often includes pressure values. As explained on the doc page for the thermo_style command, the default pressure is setup by the thermo command itself. It is NOT the pressure associated with any barostatting fix you have defined or with any compute you have defined that calculates a pressure. The doc pages for the barostatting fixes explain the ID of the pressure compute they create. Thus if you want to view these pressures, you need to specify them explicitly via the thermo_style custom command. Or you can use the thermo_modify command to re-define what pressure compute is used for default thermodynamic output.
Walls in an MD simulation are typically used to bound particle motion, i.e. to serve as a boundary condition.

Walls in LAMMPS can be of rough (made of particles) or idealized surfaces. Ideal walls can be smooth, generating forces only in the normal direction, or frictional, generating forces also in the tangential direction.

Rough walls, built of particles, can be created in various ways. The particles themselves can be generated like any other particle, via the `lattice` and `create_atoms` commands, or read in via the `read_data` command.

Their motion can be constrained by many different commands, so that they do not move at all, move together as a group at constant velocity or in response to a net force acting on them, move in a prescribed fashion (e.g. rotate around a point), etc. Note that if a time integration fix like `fix nve` or `fix nvt` is not used with the group that contains wall particles, their positions and velocities will not be updated.

- `fix aveforce` - set force on particles to average value, so they move together
- `fix setforce` - set force on particles to a value, e.g. 0.0
- `fix freeze` - freeze particles for use as granular walls
- `fix nve/noforce` - advect particles by their velocity, but without force
- `fix move` - prescribe motion of particles by a linear velocity, oscillation, rotation, variable

The `fix move` command offers the most generality, since the motion of individual particles can be specified with `variable` formula which depends on time and/or the particle position.

For rough walls, it may be useful to turn off pairwise interactions between wall particles via the `neigh_modify exclude` command.

Rough walls can also be created by specifying frozen particles that do not move and do not interact with mobile particles, and then tethering other particles to the fixed particles, via a `bond`. The bonded particles do interact with other mobile particles.

Idealized walls can be specified via several fix commands. Fix `wall/gran` creates frictional walls for use with granular particles; all the other commands create smooth walls.

- `fix wall/reflect` - reflective flat walls
- `fix wall/lj93` - flat walls, with Lennard-Jones 9/3 potential
- `fix wall/lj126` - flat walls, with Lennard-Jones 12/6 potential
- `fix wall/colloid` - flat walls, with `pair_style colloid` potential
- `fix wall/harmonic` - flat walls, with repulsive harmonic spring potential
- `fix wall/morse` - flat walls, with Morse potential
- `fix wall/region` - use region surface as wall
- `fix wall/gran` - flat or curved walls with `pair_style granular` potential

The `lj93`, `lj126`, `colloid`, `harmonic`, and `morse` styles all allow the flat walls to move with a constant velocity, or oscillate in time. The `fix wall/region` command offers the most generality, since the region surface is treated as a wall, and the geometry of the region can be a simple primitive volume (e.g. a sphere, or cube, or plane), or a complex volume made from the union and intersection of primitive volumes. Regions can also specify a volume “interior” or “exterior” to the specified primitive shape or union or intersection. Regions can also be “dynamic” meaning they move with constant velocity, oscillate, or rotate.

The only frictional idealized walls currently in LAMMPS are flat or curved surfaces specified by the `fix wall/gran` command. At some point we plan to allow region surfaces to be used as frictional walls, as well as triangulated surfaces.
8.3.6 NEMD simulations

Non-equilibrium molecular dynamics or NEMD simulations are typically used to measure a fluid’s rheological properties such as viscosity. In LAMMPS, such simulations can be performed by first setting up a non-orthogonal simulation box (see the preceding Howto section).

A shear strain can be applied to the simulation box at a desired strain rate by using the `fix deform` command. The `fix nvt/sllod` command can be used to thermostat the sheared fluid and integrate the SLLOD equations of motion for the system. Fix nvt/sllod uses `compute temp/deform` to compute a thermal temperature by subtracting out the streaming velocity of the shearing atoms. The velocity profile or other properties of the fluid can be monitored via the `fix ave/chunk` command.

**Note:** A recent (2017) book by *(Daivis and Todd)* discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostating generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

As discussed in the previous section on non-orthogonal simulation boxes, the amount of tilt or skew that can be applied is limited by LAMMPS for computational efficiency to be 1/2 of the parallel box length. However, `fix deform` can continuously strain a box by an arbitrary amount. As discussed in the `fix deform` command, when the tilt value reaches a limit, the box is flipped to the opposite limit which is an equivalent tiling of periodic space. The strain rate can then continue to change as before. In a long NEMD simulation these box re-shaping events may occur many times.

In a NEMD simulation, the “remap” option of `fix deform` should be set to “remap v”, since that is what `fix nvt/sllod` assumes to generate a velocity profile consistent with the applied shear strain rate.

An alternative method for calculating viscosities is provided via the `fix viscosity` command.

NEMD simulations can also be used to measure transport properties of a fluid through a pore or channel. Simulations of steady-state flow can be performed using the `fix flow/gauss` command.

8.3.7 Long-range dispersion settings

The PPPM method computes interactions by splitting the pair potential into two parts, one of which is computed in a normal pairwise fashion, the so-called real-space part, and one of which is computed using the Fourier transform, the so called reciprocal-space or kspace part. For both parts, the potential is not computed exactly but is approximated. Thus, there is an error in both parts of the computation, the real-space and the kspace error. The just mentioned facts are true both for the PPPM for Coulomb as well as dispersion interactions. The deciding difference - and also the reason why the parameters for ppm/disp have to be selected with more care - is the impact of the errors on the results: The kspace error of the PPPM for Coulomb and dispersion interaction and the real-space error of the PPPM for Coulomb interaction have the character of noise. In contrast, the real-space error of the PPPM for dispersion has a clear physical interpretation: the underprediction of cohesion. As a consequence, the real-space error has a much stronger effect than the kspace error on simulation results for ppm/disp. Parameters must thus be chosen in a way that this error is much smaller than the kspace error.

When using ppm/disp and not making any specifications on the PPPM parameters via the kspace modify command, parameters will be tuned such that the real-space error and the kspace error are equal. This will result in simulations that are either inaccurate or slow, both of which is not desirable. For selecting parameters for the ppm/disp that provide fast and accurate simulations, there are two approaches, which both have their up- and downsides.

The first approach is to set desired real-space an kspace accuracies via the `kspace_modify force/disp/real` and `kspace_modify force/disp/kspace` commands. Note that the accuracies have to be specified in force units and are
thus dependent on the chosen unit settings. For real units, 0.0001 and 0.002 seem to provide reasonable accurate and efficient computations for the real-space and kspace accuracies. 0.002 and 0.05 work well for most systems using lj units. PPPM parameters will be generated based on the desired accuracies. The upside of this approach is that it usually provides a good set of parameters and will work for both the kspace_modify diff ad and kspace_modify diff ik options. The downside of the method is that setting the PPPM parameters will take some time during the initialization of the simulation.

The second approach is to set the parameters for the pppm/disp explicitly using the kspace_modify mesh/disp, kspace_modify order/disp, and kspace_modify gewald/disp commands. This approach requires a more experienced user who understands well the impact of the choice of parameters on the simulation accuracy and performance. This approach provides a fast initialization of the simulation. However, it is sensitive to errors: A combination of parameters that will perform well for one system might result in far-from-optimal conditions for other simulations. For example, parameters that provide accurate and fast computations for all-atomistic force fields can provide insufficient accuracy or united-atomistic force fields (which is related to that the latter typically have larger dispersion coefficients).

To avoid inaccurate or inefficient simulations, the pppm/disp stops simulations with an error message if no action is taken to control the PPPM parameters. If the automatic parameter generation is desired and real-space and kspace accuracies are desired to be equal, this error message can be suppressed using the kspace_modify disp/auto yes command.

A reasonable approach that combines the upsides of both methods is to make the first run using the kspace_modify force/disp/real and kspace_modify force/disp/kspace commands, write down the PPPM parameters from the output, and specify these parameters using the second approach in subsequent runs (which have the same composition, force field, and approximately the same volume).

Concerning the performance of the pppm/disp there are two more things to consider. The first is that when using the pppm/disp, the cutoff parameter does no longer affect the accuracy of the simulation (subject to that gewald/disp is adjusted when changing the cutoff). The performance can thus be increased by examining different values for the cutoff parameter. A lower bound for the cutoff is only set by the truncation error of the repulsive term of pair potentials.

The second is that the mixing rule of the pair style has an impact on the computation time when using the pppm/disp. Fastest computations are achieved when using the geometric mixing rule. Using the arithmetic mixing rule substantially increases the computational cost. The computational overhead can be reduced using the kspace_modify mix/disp geom and kspace_modify splittol commands. The first command simply enforces geometric mixing of the dispersion coefficients in kspace computations. This introduces some error in the computations but will also significantly speed-up the simulations. The second keyword sets the accuracy with which the dispersion coefficients are approximated using a matrix factorization approach. This may result in better accuracy then using the first command, but will usually also not provide an equally good increase of efficiency.

Finally, pppm/disp can also be used when no mixing rules apply. This can be achieved using the kspace_modify mix/disp none command. Note that the code does not check automatically whether any mixing rule is fulfilled. If mixing rules do not apply, the user will have to specify this command explicitly.

8.4 Analysis howto

8.4.1 Output from LAMMPS (thermo, dumps, computes, fixes, variables)

There are four basic kinds of LAMMPS output:

- **Thermodynamic output**, which is a list of quantities printed every few timesteps to the screen and logfile.
- **Dump files**, which contain snapshots of atoms and various per-atom values and are written at a specified frequency.
- **Certain fixes** can output user-specified quantities to files: fix ave/time for time averaging, fix ave/chunk for spatial or other averaging, and fix print for single-line output of variables. Fix print can also output to the screen.
• **Restart files.**

A simulation prints one set of thermodynamic output and (optionally) restart files. It can generate any number of dump files and fix output files, depending on what dump and fix commands you specify.

As discussed below, LAMMPS gives you a variety of ways to determine what quantities are computed and printed when the thermodynamics, dump, or fix commands listed above perform output. Throughout this discussion, note that users can also add their own computes and fixes to LAMMPS which can then generate values that can then be output with these commands.

The following sub-sections discuss different LAMMPS command related to output and the kind of data they operate on and produce:

- Global/per-atom/local data
- Scalar/vector/array data
- Thermodynamic output
- Dump file output
- Fixes that write output files
- Computes that process output quantities
- Fixes that process output quantities
- Computes that generate values to output
- Fixes that generate values to output
- Variables that generate values to output
- Summary table of output options and data flow between commands

**Global/per-atom/local data**

Various output-related commands work with three different styles of data: global, per-atom, or local. A global datum is one or more system-wide values, e.g. the temperature of the system. A per-atom datum is one or more values per atom, e.g. the kinetic energy of each atom. Local datums are calculated by each processor based on the atoms it owns, but there may be zero or more per atom, e.g. a list of bond distances.

**Scalar/vector/array data**

Global, per-atom, and local datums can each come in three kinds: a single scalar value, a vector of values, or a 2d array of values. The doc page for a “compute” or “fix” or “variable” that generates data will specify both the style and kind of data it produces, e.g. a per-atom vector.

When a quantity is accessed, as in many of the output commands discussed below, it can be referenced via the following bracket notation, where ID in this case is the ID of a compute. The leading “c_” would be replaced by “f_” for a fix, or “v_” for a variable:

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c_ID</td>
<td>entire scalar, vector, or array</td>
</tr>
<tr>
<td>c_ID[I]</td>
<td>one element of vector, one column of array</td>
</tr>
<tr>
<td>c_ID[I][J]</td>
<td>one element of array</td>
</tr>
</tbody>
</table>

In other words, using one bracket reduces the dimension of the data once (vector -> scalar, array -> vector). Using two brackets reduces the dimension twice (array -> scalar). Thus a command that uses scalar values as input can typically also process elements of a vector or array.
Disambiguation

Some computes and fixes produce data in multiple styles, e.g. a global scalar and a per-atom vector. Usually the context in which the input script references the data determines which style is meant. Example: if a compute provides both a global scalar and a per-atom vector, the former will be accessed by using \texttt{c\_ID} in an equal-style variable, while the latter will be accessed by using \texttt{c\_ID} in an atom-style variable. Note that atom-style variable formulas can also access global scalars, but in this case it is not possible to do directly because of the ambiguity. Instead, an equal-style variable can be defined which accesses the global scalar, and that variable used in the atom-style variable formula in place of \texttt{c\_ID}.

Thermodynamic output

The frequency and format of thermodynamic output is set by the \texttt{thermo}, \texttt{thermo\_style}, and \texttt{thermo\_modify} commands. The \texttt{thermo\_style} command also specifies what values are calculated and written out. Pre-defined keywords can be specified (e.g. press, etotal, etc). Three additional kinds of keywords can also be specified (\texttt{c\_ID}, \texttt{f\_ID}, \texttt{v\_name}), where a \texttt{compute} or \texttt{fix} or \texttt{variable} provides the value to be output. In each case, the compute, fix, or variable must generate global values for input to the \texttt{thermo\_style custom} command.

Note that thermodynamic output values can be “extensive” or “intensive”. The former scale with the number of atoms in the system (e.g. total energy), the latter do not (e.g. temperature). The setting for \texttt{thermo\_modify norm} determines whether extensive quantities are normalized or not. Computes and fixes produce either extensive or intensive values; see their individual doc pages for details. \textit{Equal-style variables} produce only intensive values; you can include a division by “natoms” in the formula if desired, to make an extensive calculation produce an intensive result.

Dump file output

Dump file output is specified by the \texttt{dump} and \texttt{dump\_modify} commands. There are several pre-defined formats (dump atom, dump xtc, etc).

There is also a \texttt{dump custom} format where the user specifies what values are output with each atom. Pre-defined atom attributes can be specified (id, x, fx, etc). Three additional kinds of keywords can also be specified (\texttt{c\_ID}, \texttt{f\_ID}, \texttt{v\_name}), where a \texttt{compute} or \texttt{fix} or \texttt{variable} provides the values to be output. In each case, the compute, fix, or variable must generate per-atom values for input to the \texttt{dump custom} command.

There is also a \texttt{dump local} format where the user specifies what local values to output. A pre-defined index keyword can be specified to enumerate the local values. Two additional kinds of keywords can also be specified (\texttt{c\_ID}, \texttt{f\_ID}), where a \texttt{compute} or \texttt{fix} or \texttt{variable} provides the values to be output. In each case, the compute or fix must generate local values for input to the \texttt{dump local} command.

Fixes that write output files

Several fixes take various quantities as input and can write output files: \texttt{fix ave/time}, \texttt{fix ave/chunk}, \texttt{fix ave/histo}, \texttt{fix ave/correlate}, and \texttt{fix print}.

The \texttt{fix ave/time} command enables direct output to a file and/or time-averaging of global scalars or vectors. The user specifies one or more quantities as input. These can be global \texttt{compute} values, global \texttt{fix} values, or \texttt{variables} of any style except the atom style which produces per-atom values. Since a variable can refer to keywords used by the \texttt{thermo\_style custom} command (like temp or press) and individual per-atom values, a wide variety of quantities can be time averaged and/or output in this way. If the inputs are one or more scalar values, then the fix generate a global scalar or vector of output. If the inputs are one or more vector values, then the fix generates a global vector or array of output. The time-averaged output of this fix can also be used as input to other output commands.

The \texttt{fix ave/chunk} command enables direct output to a file of chunk-averaged per-atom quantities like those output in dump files. Chunks can represent spatial bins or other collections of atoms, e.g. individual molecules. The per-atom
quantities can be atom density (mass or number) or atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a compute, by a fix, or by an atom-style variable. The chunk-averaged output of this fix can also be used as input to other output commands.

The fix ave/histo command enables direct output to a file of histogrammed quantities, which can be global or per-atom or local quantities. The histogram output of this fix can also be used as input to other output commands.

The fix ave/correlate command enables direct output to a file of time-correlated quantities, which can be global values. The correlation matrix output of this fix can also be used as input to other output commands.

The fix print command can generate a line of output written to the screen and log file or to a separate file, periodically during a running simulation. The line can contain one or more variable values for any style variable except the vector or atom styles). As explained above, variables themselves can contain references to global values generated by thermodynamic keywords, computes, fixes, or other variables, or to per-atom values for a specific atom. Thus the fix print command is a means to output a wide variety of quantities separate from normal thermodynamic or dump file output.

Computes that process output quantities

The compute reduce and compute reduce/region commands take one or more per-atom or local vector quantities as inputs and “reduce” them (sum, min, max, ave) to scalar quantities. These are produced as output values which can be used as input to other output commands.

The compute slice command take one or more global vector or array quantities as inputs and extracts a subset of their values to create a new vector or array. These are produced as output values which can be used as input to other output commands.

The compute property/atom command takes a list of one or more pre-defined atom attributes (id, x, fx, etc) and stores the values in a per-atom vector or array. These are produced as output values which can be used as input to other output commands. The list of atom attributes is the same as for the dump custom command.

The compute property/local command takes a list of one or more pre-defined local attributes (bond info, angle info, etc) and stores the values in a local vector or array. These are produced as output values which can be used as input to other output commands.

Fixes that process output quantities

The fix vector command can create global vectors as output from global scalars as input, accumulating them one element at a time.

The fix ave/atom command performs time-averaging of per-atom vectors. The per-atom quantities can be atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a compute, by a fix, or by an atom-style variable. The time-averaged per-atom output of this fix can be used as input to other output commands.

The fix store/state command can archive one or more per-atom attributes at a particular time, so that the old values can be used in a future calculation or output. The list of atom attributes is the same as for the dump custom command, including per-atom quantities calculated by a compute, by a fix, or by an atom-style variable. The output of this fix can be used as input to other output commands.
Computes that generate values to output

Every compute in LAMMPS produces either global or per-atom or local values. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The doc page for each compute command describes what it produces. Computes that produce per-atom or local values have the word “atom” or “local” in their style name. Computes without the word “atom” or “local” produce global values.

Fixes that generate values to output

Some fixes in LAMMPS produces either global or per-atom or local values which can be accessed by other commands. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The doc page for each fix command tells whether it produces any output quantities and describes them.

Variables that generate values to output

Variables defined in an input script can store one or more strings. But equal-style, vector-style, and atom-style or atomfile-style variables generate a global scalar value, global vector or values, or a per-atom vector, respectively, when accessed. The formulas used to define these variables can contain references to the thermodynamic keywords and to global and per-atom data generated by computes, fixes, and other variables. The values generated by variables can be used as input to and thus output by the other commands described in this section.

Summary table of output options and data flow between commands

This table summarizes the various commands that can be used for generating output from LAMMPS. Each command produces output data of some kind and/or writes data to a file. Most of the commands can take data from other commands as input. Thus you can link many of these commands together in pipeline form, where data produced by one command is used as input to another command and eventually written to the screen or to a file. Note that to hook two commands together the output and input data types must match, e.g. global/per-atom/local data and scalar/vector/array data.

Also note that, as described above, when a command takes a scalar as input, that could be an element of a vector or array. Likewise a vector input could be a column of an array.
### 8.4.2 Use chunks to calculate system properties

In LAMMPS, “chunks” are collections of atoms, as defined by the `compute chunk/atom` command, which assigns each atom to a chunk ID (or to no chunk at all). The number of chunks and the assignment of chunk IDs to atoms can be static or change over time. Examples of “chunks” are molecules or spatial bins or atoms with similar values (e.g. coordination number or potential energy).

The per-atom chunk IDs can be used as input to two other kinds of commands, to calculate various properties of a system:

- `fix ave/chunk`
- any of the `compute */chunk` commands

Here a brief overview for each of the 4 kinds of chunk-related commands is provided. Then some examples are given of how to compute different properties with chunk commands.

LAMMPS Documentation

**Compute chunk/atom command:**

This compute can assign atoms to chunks of various styles. Only atoms in the specified group and optional specified region are assigned to a chunk. Here are some possible chunk definitions:

<table>
<thead>
<tr>
<th>Description</th>
<th>_chunk ID = Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>atoms in same molecule</td>
<td>molecule ID</td>
</tr>
<tr>
<td>atoms of same atom type</td>
<td>atom type</td>
</tr>
<tr>
<td>all atoms with same atom property (charge, radius, etc)</td>
<td>output of compute property/atom</td>

</tr>
<tr>
<td>atoms in same spatial bin</td>
<td>bin ID</td>
</tr>
<tr>
<td>atoms in same rigid body</td>
<td>molecule ID used to define rigid bodies</td>
</tr>
<tr>
<td>atoms with similar potential energy</td>
<td>output of compute pe/atom</td>
</tr>
<tr>
<td>atoms with same local defect structure</td>
<td>output of compute centro/atom or compute coord/atom command</td>
</tr>
</tbody>
</table>

Note that chunk IDs are integer values, so for atom properties or computes that produce a floating point value, they will be truncated to an integer. You could also use the compute in a variable that scales the floating point value to spread it across multiple integers.

Spatial bins can be of various kinds, e.g. 1d bins = slabs, 2d bins = pencils, 3d bins = boxes, spherical bins, cylindrical bins.

This compute also calculates the number of chunks \( N_{\text{chunk}} \), which is used by other commands to tally per-chunk data. \( N_{\text{chunk}} \) can be a static value or change over time (e.g. the number of clusters). The chunk ID for an individual atom can also be static (e.g. a molecule ID), or dynamic (e.g. what spatial bin an atom is in as it moves).

Note that this compute allows the per-atom output of other computes, fixes, and variables to be used to define chunk IDs for each atom. This means you can write your own compute or fix to output a per-atom quantity to use as chunk ID. See the Modify doc pages for info on how to do this. You can also define a per-atom variable in the input script that uses a formula to generate a chunk ID for each atom.

**Fix ave/chunk command:**

This fix takes the ID of a compute chunk/atom command as input. For each chunk, it then sums one or more specified per-atom values over the atoms in each chunk. The per-atom values can be any atom property, such as velocity, force, charge, potential energy, kinetic energy, stress, etc. Additional keywords are defined for per-chunk properties like density and temperature. More generally any per-atom value generated by other computes, fixes, and per-atom variables, can be summed over atoms in each chunk.

Similar to other averaging fixes, this fix allows the summed per-chunk values to be time-averaged in various ways, and output to a file. The fix produces a global array as output with one row of values per chunk.

**Compute */chunk commands:**

The following computes operate on chunks of atoms to produce per-chunk values. Any compute whose style name ends in “/chunk” is in this category:

- compute com/chunk
- compute gyration/chunk
- compute inertia/chunk
- compute msd/chunk
• compute property/chunk
• compute temp/chunk
• compute torque/chunk
• compute vcm/chunk

They each take the ID of a compute chunk/atom command as input. As their names indicate, they calculate the center-of-mass, radius of gyration, moments of inertia, mean-squared displacement, temperature, torque, and velocity of center-of-mass for each chunk of atoms. The compute property/chunk command can tally the count of atoms in each chunk and extract other per-chunk properties.

The reason these various calculations are not part of the fix ave/chunk command, is that each requires a more complicated operation than simply summing and averaging over per-atom values in each chunk. For example, many of them require calculation of a center of mass, which requires summing mass*position over the atoms and then dividing by summed mass.

All of these computes produce a global vector or global array as output, with one or more values per chunk. The output can be used in various ways:

• As input to the fix ave/time command, which can write the values to a file and optionally time average them.
• As input to the fix ave/histo command to histogram values across chunks. E.g. a histogram of cluster sizes or molecule diffusion rates.
• As input to special functions of equal-style variables, like sum() and max() and ave(). E.g. to find the largest cluster or fastest diffusing molecule or average radius-of-gyration of a set of molecules (chunks).

Other chunk commands:

• compute chunk/spread/atom
• compute reduce/chunk

The compute chunk/spread/atom command spreads per-chunk values to each atom in the chunk, producing per-atom values as its output. This can be useful for outputting per-chunk values to a per-atom dump file. Or for using an atom’s associated chunk value in an atom-style variable. Or as input to the fix ave/chunk command to spatially average per-chunk values calculated by a per-chunk compute.

The compute reduce/chunk command reduces a peratom value across the atoms in each chunk to produce a value per chunk. When used with the compute chunk/spread/atom command it can create peratom values that induce a new set of chunks with a second compute chunk/atom command.

Example calculations with chunks

Here are examples using chunk commands to calculate various properties:

(1) Average velocity in each of 1000 2d spatial bins:

```
compute  ccl all chunk/atom bin/2d x 0.0 0.1 y lower 0.01 units reduced
fix  1 all ave/chunk 100 10 1000 ccl vx vy file tmp.out
```

(2) Temperature in each spatial bin, after subtracting a flow velocity:

```
compute  ccl all chunk/atom bin/2d x 0.0 0.1 y lower 0.1 units reduced
compute  vbias all temp/profile 1 0 0 y 10
fix  1 all ave/chunk 100 10 1000 ccl temp bias vbias file tmp.out
```

(3) Center of mass of each molecule:
compute ccl all chunk/atom molecule
compute myChunk all com/chunk ccl
fix 1 all ave/time 100 1 100 c_myChunk[*] file tmp.out mode vector

(4) Total force on each molecule and ave/max across all molecules:

compute ccl all chunk/atom molecule
fix 1 all ave/chunk 1000 1 1000 ccl fx fy fz file tmp.out
variable xave equal ave(f_1[2])
variable xmax equal max(f_1[2])
thermo 1000
thermo_style custom step temp v_xave v_max

(5) Histogram of cluster sizes:

compute cluster all cluster/atom 1.0
compute ccl all chunk/atom c_cluster compress yes
compute size all property/chunk ccl count
fix 1 all ave/histo 100 1 100 0 20 20 c_size mode vector ave running beyond ignore_
→ file tmp.histo

(6) An example for using a per-chunk value to apply per-atom forces to compress individual polymer chains (molecules) in a mixture, is explained on the compute chunk/spread/atom command doc page.

(7) An example for using one set of per-chunk values for molecule chunks, to create a second set of micelle-scale chunks (clustered molecules, due to hydrophobicity), is explained on the compute reduce/chunk command doc page.

(8) An example for using one set of per-chunk values (dipole moment vectors) for molecule chunks, spreading the values to each atom in each chunk, then defining a second set of chunks as spatial bins, and using the fix ave/chunk command to calculate an average dipole moment vector for each bin. This example is explained on the compute chunk/spread/atom command doc page.

### 8.4.3 Calculate temperature

Temperature is computed as kinetic energy divided by some number of degrees of freedom (and the Boltzmann constant). Since kinetic energy is a function of particle velocity, there is often a need to distinguish between a particle’s advection velocity (due to some aggregate motion of particles) and its thermal velocity. The sum of the two is the particle’s total velocity, but the latter is often what is wanted to compute a temperature.

LAMMPS has several options for computing temperatures, any of which can be used in thermostatting and barostatting. These compute commands calculate temperature:

- `compute temp`
- `compute temp/sphere`
- `compute temp/asphere`
- `compute temp/com`
- `compute temp/deform`
- `compute temp/partial`
- `compute temp/profile`
- `compute temp/ramp`
- `compute temp/region`
All but the first 3 calculate velocity biases directly (e.g. advection velocities) that are removed when computing the thermal temperature. *Compute temp/sphere* and *compute temp/asphere* compute kinetic energy for finite-size particles that includes rotational degrees of freedom. They both allow for velocity biases indirectly, via an optional extra argument which is another temperature compute that subtracts a velocity bias. This allows the translational velocity of spherical or aspherical particles to be adjusted in prescribed ways.

### 8.4.4 Calculate elastic constants

Elastic constants characterize the stiffness of a material. The formal definition is provided by the linear relation that holds between the stress and strain tensors in the limit of infinitesimal deformation. In tensor notation, this is expressed as $s_{ij} = C_{ijkl} * e_{kl}$, where the repeated indices imply summation. $s_{ij}$ are the elements of the symmetric stress tensor, $e_{kl}$ are the elements of the symmetric strain tensor, $C_{ijkl}$ are the elements of the fourth rank tensor of elastic constants. In three dimensions, this tensor has $3^4=81$ elements. Using Voigt notation, the tensor can be written as a 6x6 matrix, where $C_{ij}$ is now the derivative of $s_i$ w.r.t. $e_j$. Because $s_i$ is itself a derivative w.r.t. $e_i$, it follows that $C_{ij}$ is also symmetric, with at most $7*6/2 = 21$ distinct elements.

At zero temperature, it is easy to estimate these derivatives by deforming the simulation box in one of the six directions using the `change_box` command and measuring the change in the stress tensor. A general-purpose script that does this is given in the examples/elastic directory described on the Examples doc page.

Calculating elastic constants at finite temperature is more challenging, because it is necessary to run a simulation that performs time averages of differential properties. One way to do this is to measure the change in average stress tensor in an NVT simulations when the cell volume undergoes a finite deformation. In order to balance the systematic and statistical errors in this method, the magnitude of the deformation must be chosen judiciously, and care must be taken to fully equilibrate the deformed cell before sampling the stress tensor. Another approach is to sample the triclinic cell fluctuations that occur in an NPT simulation. This method can also be slow to converge and requires careful post-processing *(Shinoda)*.

### 8.4.5 Calculate thermal conductivity

The thermal conductivity $\kappa$ of a material can be measured in at least 4 ways using various options in LAMMPS. See the examples/KAPPA directory for scripts that implement the 4 methods discussed here for a simple Lennard-Jones fluid model. Also, see the *Howto viscosity* doc page for an analogous discussion for viscosity.

The thermal conductivity tensor $\kappa$ is a measure of the propensity of a material to transmit heat energy in a diffusive manner as given by Fourier’s law

$$J = -\kappa \text{grad}(T)$$

where $J$ is the heat flux in units of energy per area per time and grad$(T)$ is the spatial gradient of temperature. The thermal conductivity thus has units of energy per distance per time per degree K and is often approximated as an isotropic quantity, i.e. as a scalar.

The first method is to setup two thermostatted regions at opposite ends of a simulation box, or one in the middle and one at the end of a periodic box. By holding the two regions at different temperatures with a `thermostatting fix`, the energy added to the hot region should equal the energy subtracted from the cold region and be proportional to the heat flux moving between the regions. See the papers by Ikeshoji and Hafskjold and Wirnsberger et al for details of this idea. Note that thermostatting fixes such as `fix nvt`, `fix langevin`, and `fix temp/rescale` store the cumulative energy they add/subtract.

Alternatively, as a second method, the `fix heat` or `fix ehex` commands can be used in place of thermostats on each of two regions to add/subtract specified amounts of energy to both regions. In both cases, the resulting temperatures

8.4. Analysis howto
of the two regions can be monitored with the “compute temp/region” command and the temperature profile of the intermediate region can be monitored with the fix ave/chunk and compute ke/atom commands.

The third method is to perform a reverse non-equilibrium MD simulation using the fix thermal/conductivity command which implements the rNEMD algorithm of Muller-Plathe. Kinetic energy is swapped between atoms in two different layers of the simulation box. This induces a temperature gradient between the two layers which can be monitored with the fix ave/chunk and compute ke/atom commands. The fix tallies the cumulative energy transfer that it performs. See the fix thermal/conductivity command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the heat flux to kappa. The heat flux can be calculated from the fluctuations of per-atom potential and kinetic energies and per-atom stress tensor in a steady-state equilibrated simulation. This is in contrast to the two preceding non-equilibrium methods, where energy flows continuously between hot and cold regions of the simulation box.

The compute heat/flux command can calculate the needed heat flux and describes how to implement the Green_Kubo formalism using additional LAMMPS commands, such as the fix ave/correlate command to calculate the needed auto-correlation. See the doc page for the compute heat/flux command for an example input script that calculates the thermal conductivity of solid Ar via the GK formalism.

(Ikeshoji) Ikeshoji and Hafskjold, Molecular Physics, 81, 251-261 (1994).

8.4.6 Calculate viscosity

The shear viscosity $\eta$ of a fluid can be measured in at least 6 ways using various options in LAMMPS. See the examples/VISCOSITY directory for scripts that implement the 5 methods discussed here for a simple Lennard-Jones fluid model and 1 method for SPC/E water model. Also, see the page on calculating thermal conductivity for an analogous discussion for thermal conductivity.

$\eta$ is a measure of the propensity of a fluid to transmit momentum in a direction perpendicular to the direction of velocity or momentum flow. Alternatively it is the resistance the fluid has to being sheared. It is given by

$$J = -\eta \nabla (V_{\text{stream}})$$

where $J$ is the momentum flux in units of momentum per area per time. and $\nabla (V_{\text{stream}})$ is the spatial gradient of the velocity of the fluid moving in another direction, normal to the area through which the momentum flows. Viscosity thus has units of pressure-time.

The first method is to perform a non-equilibrium MD (NEMD) simulation by shearing the simulation box via the fix deform command, and using the fix nvt/sllod command to thermostat the fluid via the SLLOD equations of motion. Alternatively, as a second method, one or more moving walls can be used to shear the fluid in between them, again with some kind of thermostat that modifies only the thermal (non-shearing) components of velocity to prevent the fluid from heating up.

Note: A recent (2017) book by (Daivis and Todd) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostatting generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

In both cases, the velocity profile setup in the fluid by this procedure can be monitored by the fix ave/chunk command, which determines $\nabla (V_{\text{stream}})$ in the equation above. E.g. the derivative in the y-direction of the Vx component of fluid motion or $\nabla (V_{\text{stream}}) = dVx/dy$. The Pxy off-diagonal component of the pressure or stress tensor, as calculated by the compute pressure command, can also be monitored, which is the J term in the equation above. See the Howto nemd doc page for details on NEMD simulations.
The third method is to perform a reverse non-equilibrium MD simulation using the `fix viscosity` command which implements the rNEMD algorithm of Muller-Plathe. Momentum in one dimension is swapped between atoms in two different layers of the simulation box in a different dimension. This induces a velocity gradient which can be monitored with the `fix ave/chunk` command. The fix tallies the cumulative momentum transfer that it performs. See the `fix viscosity` command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the stress/pressure tensor to eta. This can be done in a fully equilibrated simulation which is in contrast to the two preceding non-equilibrium methods, where momentum flows continuously through the simulation box.

Here is an example input script that calculates the viscosity of liquid Ar via the GK formalism:

```lmp
# Sample LAMMPS input script for viscosity of liquid Ar

units real
variable T equal 86.4956
variable V equal vol
variable dt equal 4.0
variable p equal 400      # correlation length
variable s equal 5        # sample interval
variable d equal $p*$s    # dump interval

# convert from LAMMPS real units to SI

variable kB equal 1.3806504e-23      # [J/K] Boltzmann
variable atm2Pa equal 101325.0
variable A2m equal 1.0e-10
variable fs2s equal 1.0e-15
variable convert equal $atm2Pa*$atm2Pa*$fs2s*$A2m*$A2m*$A2m

# setup problem

# viscosity calculation, switch to NVE if desired

#unfix NVT
#fix NVE all nve
reset_timestep 0
variable pxy equal pxy
variable pxz equal pxz
```

(continues on next page)
The fifth method is related to the above Green-Kubo method, but uses the Einstein formulation, analogous to the Einstein mean-square-displacement formulation for self-diffusivity. The time-integrated momentum fluxes play the role of Cartesian coordinates, whose mean-square displacement increases linearly with time at sufficiently long times.

The sixth is periodic perturbation method. It is also a non-equilibrium MD method. However, instead of measure the momentum flux in response of applied velocity gradient, it measures the velocity profile in response of applied stress. A cosine-shaped periodic acceleration is added to the system via the `fix accelerate/cos` command, and the `compute viscosity/cos` command is used to monitor the generated velocity profile and remove the velocity bias before thermostatting.

**Note:** An article by (Hess) discussed the accuracy and efficiency of these methods.

### 8.4.7 Calculate diffusion coefficients

The diffusion coefficient \(D\) of a material can be measured in at least 2 ways using various options in LAMMPS. See the examples/DIFFUSE directory for scripts that implement the 2 methods discussed here for a simple Lennard-Jones fluid model.

The first method is to measure the mean-squared displacement (MSD) of the system, via the `compute msd` command. The slope of the MSD versus time is proportional to the diffusion coefficient. The instantaneous MSD values can be accumulated in a vector via the `fix vector` command, and a line fit to the vector to compute its slope via the `variable slope` function, and thus extract \(D\).

The second method is to measure the velocity auto-correlation function (VACF) of the system, via the `compute vacf` command. The time-integral of the VACF is proportional to the diffusion coefficient. The instantaneous VACF values can be accumulated in a vector via the `fix vector` command, and time integrated via the `variable trap` function, and thus extract \(D\).
8.5 Force fields howto

8.5.1 CHARMM, AMBER, COMPASS, and DREIDING force fields

A force field has 2 parts: the formulas that define it and the coefficients used for a particular system. Here we only discuss formulas implemented in LAMMPS that correspond to formulas commonly used in the CHARMM, AMBER, COMPASS, and DREIDING force fields. Setting coefficients is done either from special sections in an input data file via the read_data command or in the input script with commands like pair_coeff or bond_coeff and so on. See the Tools doc page for additional tools that can use CHARMM, AMBER, or Materials Studio generated files to assign force field coefficients and convert their output into LAMMPS input.

See (MacKerell) for a description of the CHARMM force field. See (Cornell) for a description of the AMBER force field. See (Sun) for a description of the COMPASS force field.

The interaction styles listed below compute force field formulas that are consistent with common options in CHARMM or AMBER. See each command’s documentation for the formula it computes.

- bond_style harmonic
- angle_style charmm
- dihedral_style charmmfsh
- dihedral_style charmm
- pair_style lj/charmmfsw/coul/charmmfsh
- pair_style lj/charmmfsw/coul/long
- pair_style lj/charmm/coul/charmm
- pair_style lj/charmm/coul/charmm/implicit
- pair_style lj/charmm/coul/long
- special_bonds charmm
- special_bonds amber

Note: For CHARMM, newer charmmfsw or charmmfsh styles were released in March 2017. We recommend they be used instead of the older charmm styles. See discussion of the differences on the pair charmm and dihedral charmm doc pages.

COMPASS is a general force field for atomistic simulation of common organic molecules, inorganic small molecules, and polymers which was developed using ab initio and empirical parameterization techniques. See the Tools doc page for the msi2lmp tool for creating LAMMPS template input and data files from BIOVIA's Materials Studio files. Please note that the msi2lmp tool is very old and largely unmaintained, so it does not support all features of Materials Studio provided force field files, especially additions during the last decade. You should watch the output carefully and compare results, where possible. See (Sun) for a description of the COMPASS force field.

These interaction styles listed below compute force field formulas that are consistent with the COMPASS force field. See each command’s documentation for the formula it computes.

- bond_style class2
- angle_style class2
- dihedral_style class2
- improper_style class2

8.5. Force fields howto
DREIDING is a generic force field developed by the Goddard group at Caltech and is useful for predicting structures and dynamics of organic, biological and main-group inorganic molecules. The philosophy in DREIDING is to use general force constants and geometry parameters based on simple hybridization considerations, rather than individual force constants and geometric parameters that depend on the particular combinations of atoms involved in the bond, angle, or torsion terms. DREIDING has an explicit hydrogen bond term to describe interactions involving a hydrogen atom on very electronegative atoms (N, O, F).

See (Mayo) for a description of the DREIDING force field

The interaction styles listed below compute force field formulas that are consistent with the DREIDING force field. See each command’s documentation for the formula it computes.

- pair_style lj/class2
- pair_style lj/class2/coul/cut
- pair_style lj/class2/coul/long
- special_bonds lj/coul 0 0 1

8.5.2 TIP3P water model

The TIP3P water model as implemented in CHARMM (MacKerell) specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the 3 atoms. In LAMMPS the fix shake command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of harmonic and an angle style of harmonic or charmm should also be used.

These are the additional parameters (in real units) to set for O and H atoms and the water molecule to run a rigid TIP3P-CHARMM model with a cutoff. The K values can be used if a flexible TIP3P model (without fix shake) is desired. If the LJ epsilon and sigma for HH and OH are set to 0.0, it corresponds to the original 1983 TIP3P model (Jorgensen).

<table>

Wikipedia also has a nice article on water models.
8.5.3 TIP4P water model

The four-point TIP4P rigid water model extends the traditional three-point TIP3P model by adding an additional site, usually massless, where the charge associated with the oxygen atom is placed. This site M is located at a fixed distance away from the oxygen along the bisector of the HOH bond angle. A bond style of harmonic and an angle style of harmonic or charmm should also be used.

A TIP4P model is run with LAMMPS using either this command for a cutoff model:

- pair_style lj/cut/tip4p/cut

or these two commands for a long-range model:

- pair_style lj/cut/tip4p/long
- kspace_style pppm/tip4p

For both models, the bond lengths and bond angles should be held fixed using the fix shake command.

These are the additional parameters (in real units) to set for O and H atoms and the water molecule to run a rigid TIP4P model with a cutoff (Jorgensen). Note that the OM distance is specified in the pair_style command, not as part of the pair coefficients.

O mass = 15.9994
H mass = 1.008
O charge = -1.040
H charge = 0.520
\( r_0 \) of OH bond = 0.9572
\( \theta \) of HOH angle = 104.52°
OM distance = 0.15
LJ \( \epsilon \) of O-O = 0.1550
LJ \( \sigma \) of O-O = 3.1536
LJ \( \epsilon, \sigma \) of OH, HH = 0.0
Coulomb cutoff = 8.5

For the TIP4/Ice model (J Chem Phys, 122, 234511 (2005); https://doi.org/10.1063/1.1931662) these values can be used:

O mass = 15.9994
H mass = 1.008
O charge = -1.1794
H charge = 0.5897
\( r_0 \) of OH bond = 0.9572
\( \theta \) of HOH angle = 104.52°
OM distance = 0.1577
LJ $\epsilon$ of O-O = 0.21084
LJ $\sigma$ of O-O = 3.1668
LJ $\epsilon$, $\sigma$ of OH, HH = 0.0
Coulomb cutoff = 8.5

For the TIP4P/2005 model (J Chem Phys, 123, 234505 (2005); https://doi.org/10.1063/1.2121687), these values can be used:

O mass = 15.9994
H mass = 1.008
O charge = -1.1128
H charge = 0.5564
$r_0$ of OH bond = 0.9572
$\theta$ of HOH angle = 104.52°
OM distance = 0.1546
LJ $\epsilon$ of O-O = 0.1852
LJ $\sigma$ of O-O = 3.1589
LJ $\epsilon$, $\sigma$ of OH, HH = 0.0
Coulomb cutoff = 8.5

These are the parameters to use for TIP4P with a long-range Coulombic solver (e.g. Ewald or PPPM in LAMMPS):

O mass = 15.9994
H mass = 1.008
O charge = -1.0484
H charge = 0.5242
$r_0$ of OH bond = 0.9572
$\theta$ of HOH angle = 104.52°
OM distance = 0.1250
LJ $\epsilon$ of O-O = 0.16275
LJ $\sigma$ of O-O = 3.16435
LJ $\epsilon$, $\sigma$ of OH, HH = 0.0

Note that when using the TIP4P pair style, the neighbor list cutoff for Coulomb interactions is effectively extended by a distance $2 \times$ (OM distance), to account for the offset distance of the fictitious charges on O atoms in water molecules. Thus it is typically best in an efficiency sense to use a LJ cutoff $\geq$ Coulomb cutoff + 2*(OM distance), to shrink the size of the neighbor list. This leads to slightly larger cost for the long-range calculation, so you can test the trade-off for your model. The OM distance and the LJ and Coulombic cutoffs are set in the pair_style lj/cut/tip4p/long command.

Wikipedia also has a nice article on water models.
8.5.4 SPC water model

The SPC water model specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the 3 atoms. In LAMMPS the `fix shake` command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of `harmonic` and an angle style of `harmonic` or `charmm` should also be used.

These are the additional parameters (in real units) to set for O and H atoms and the water molecule to run a rigid SPC model.

O mass = 15.9994  
H mass = 1.008  
O charge = -0.820  
H charge = 0.410  
LJ $\epsilon$ of OO = 0.1553  
LJ $\sigma$ of OO = 3.166  
LJ $\epsilon$, $\sigma$ of OH, HH = 0.0  
\( r_0 \) of OH bond = 1.0  
\( \theta \) of HOH angle = 109.47°

Note that as originally proposed, the SPC model was run with a 9 Angstrom cutoff for both LJ and Coulomb terms. It can also be used with long-range electrostatic solvers (e.g. Ewald or PPPM in LAMMPS) without changing any of the parameters above, although it becomes a different model in that mode of usage.

The SPC/E (extended) water model is the same, except the partial charge assignments change:

O charge = -0.8476  
H charge = 0.4238

See the Berendsen reference for more details on both the SPC and SPC/E models. Wikipedia also has a nice article on water models.

8.6 Packages howto

8.6.1 Finite-size spherical and aspherical particles

Typical MD models treat atoms or particles as point masses. Sometimes it is desirable to have a model with finite-size particles such as spheroids or ellipsoids or generalized aspherical bodies. The difference is that such particles have a moment of inertia, rotational energy, and angular momentum. Rotation is induced by torque coming from interactions with other particles.

LAMMPS has several options for running simulations with these kinds of particles. The following aspects are discussed in turn:

- atom styles
- pair potentials
- time integration
- computes, thermodynamics, and dump output
- rigid bodies composed of finite-size particles

Example input scripts for these kinds of models are in the body, colloid, dipole, ellipse, line, peri, pour, and tri directories of the examples directory in the LAMMPS distribution.

Atom styles

There are several atom styles that allow for definition of finite-size particles: sphere, dipole, ellipsoid, line, tri, peri, and body.

The sphere style defines particles that are spheroids and each particle can have a unique diameter and mass (or density). These particles store an angular velocity (omega) and can be acted upon by torque. The “set” command can be used to modify the diameter and mass of individual particles, after they are created.

The dipole style does not actually define finite-size particles, but is often used in conjunction with spherical particles, via a command like

```
atom_style hybrid sphere dipole
```

This is because when dipoles interact with each other, they induce torques, and a particle must be finite-size (i.e. have a moment of inertia) in order to respond and rotate. See the atom_style dipole command for details. The “set” command can be used to modify the orientation and length of the dipole moment of individual particles, after they are created.

The ellipsoid style defines particles that are ellipsoids and thus can be aspherical. Each particle has a shape, specified by 3 diameters, and mass (or density). These particles store an angular momentum and their orientation (quaternion), and can be acted upon by torque. They do not store an angular velocity (omega), which can be in a different direction than angular momentum, rather they compute it as needed. The “set” command can be used to modify the diameter, orientation, and mass of individual particles, after they are created. It also has a brief explanation of what quaternions are.

The line style defines line segment particles with two end points and a mass (or density). They can be used in 2d simulations, and they can be joined together to form rigid bodies which represent arbitrary polygons.

The tri style defines triangular particles with three corner points and a mass (or density). They can be used in 3d simulations, and they can be joined together to form rigid bodies which represent arbitrary particles with a triangulated surface.

The peri style is used with Peridynamic models and defines particles as having a volume, that is used internally in the pair_style peri potentials.
The body style allows for definition of particles which can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. The body style is discussed in more detail on the Howto body doc page.

Note that if one of these atom styles is used (or multiple styles via the atom_style hybrid command), not all particles in the system are required to be finite-size or aspherical.

For example, in the ellipsoid style, if the 3 shape parameters are set to the same value, the particle will be a sphere rather than an ellipsoid. If the 3 shape parameters are all set to 0.0 or if the diameter is set to 0.0, it will be a point particle. In the line or tri style, if the lineflag or triflag is specified as 0, then it will be a point particle.

Some of the pair styles used to compute pairwise interactions between finite-size particles also compute the correct interaction with point particles as well, e.g. the interaction between a point particle and a finite-size particle or between two point particles. If necessary, pair_style hybrid can be used to insure the correct interactions are computed for the appropriate style of interactions. Likewise, using groups to partition particles (ellipsoids versus spheres versus point particles) will allow you to use the appropriate time integrators and temperature computations for each class of particles. See the doc pages for various commands for details.

Also note that for 2d simulations, atom styles sphere and ellipsoid still use 3d particles, rather than as circular disks or ellipses. This means they have the same moment of inertia as the 3d object. When temperature is computed, the correct degrees of freedom are used for rotation in a 2d versus 3d system.

**Pair potentials**

When a system with finite-size particles is defined, the particles will only rotate and experience torque if the force field computes such interactions. These are the various pair styles that generate torque:

- pair_style gran/history
- pair_style gran/hertz
- pair_style gran/no_history
- pair_style dipole/cut
- pair_style gayberne
- pair_style resquared
- pair_style brownian
- pair_style lubricate
- pair_style line/lj
- pair_style tri/lj
- pair_style body/nparticle

The granular pair styles are used with spherical particles. The dipole pair style is used with the dipole atom style, which could be applied to spherical or ellipsoidal particles. The GayBerne and REsquared potentials require ellipsoidal particles, though they will also work if the 3 shape parameters are the same (a sphere). The Brownian and lubrication potentials are used with spherical particles. The line, tri, and body potentials are used with line segment, triangular, and body particles respectively.
**Time integration**

There are several fixes that perform time integration on finite-size spherical particles, meaning the integrators update the rotational orientation and angular velocity or angular momentum of the particles:

- `fix nve/sphere`
- `fix nvt/sphere`
- `fix npt/sphere`

Likewise, there are 3 fixes that perform time integration on ellipsoidal particles:

- `fix nve/asphere`
- `fix nvt/asphere`
- `fix npt/asphere`

The advantage of these fixes is that those which thermostat the particles include the rotational degrees of freedom in the temperature calculation and thermostatting. The `fix langevin` command can also be used with its `omgea` or `angmom` options to thermostat the rotational degrees of freedom for spherical or ellipsoidal particles. Other thermostatting fixes only operate on the translational kinetic energy of finite-size particles.

These fixes perform constant NVE time integration on line segment, triangular, and body particles:

- `fix nve/line`
- `fix nve/tri`
- `fix nve/body`

Note that for mixtures of point and finite-size particles, these integration fixes can only be used with `groups` which contain finite-size particles.

**Computes, thermodynamics, and dump output**

There are several computes that calculate the temperature or rotational energy of spherical or ellipsoidal particles:

- `compute temp/sphere`
- `compute temp/asphere`
- `compute erotate/sphere`
- `compute erotate/asphere`

These include rotational degrees of freedom in their computation. If you wish the thermodynamic output of temperature or pressure to use one of these computes (e.g. for a system entirely composed of finite-size particles), then the compute can be defined and the `thermo_modify` command used. Note that by default thermodynamic quantities will be calculated with a temperature that only includes translational degrees of freedom. See the `thermo_style` command for details.

These commands can be used to output various attributes of finite-size particles:

- `dump custom`
- `compute property/atom`
- `dump local`
- `compute body/local`

Attributes include the dipole moment, the angular velocity, the angular momentum, the quaternion, the torque, the end-point and corner-point coordinates (for line and tri particles), and sub-particle attributes of body particles.
Rigid bodies composed of finite-size particles

The `fix rigid` command treats a collection of particles as a rigid body, computes its inertia tensor, sums the total force and torque on the rigid body each timestep due to forces on its constituent particles, and integrates the motion of the rigid body.

If any of the constituent particles of a rigid body are finite-size particles (spheres or ellipsoids or line segments or triangles), then their contribution to the inertia tensor of the body is different than if they were point particles. This means the rotational dynamics of the rigid body will be different. Thus a model of a dimer is different if the dimer consists of two point masses versus two spheroids, even if the two particles have the same mass. Finite-size particles that experience torque due to their interaction with other particles will also impart that torque to a rigid body they are part of.

See the “fix rigid” command for example of complex rigid-body models it is possible to define in LAMMPS.

Note that the `fix shake` command can also be used to treat 2, 3, or 4 particles as a rigid body, but it always assumes the particles are point masses.

Also note that body particles cannot be modeled with the `fix rigid` command. Body particles are treated by LAMMPS as single particles, though they can store internal state, such as a list of sub-particles. Individual body particles are typically treated as rigid bodies, and their motion integrated with a command like `fix nve/body`. Interactions between pairs of body particles are computed via a command like `pair_style body/nparticle`.

8.6.2 Granular models

Granular systems are composed of spherical particles with a diameter, as opposed to point particles. This means they have an angular velocity and torque can be imparted to them to cause them to rotate.

To run a simulation of a granular model, you will want to use the following commands:

- `atom_style sphere`
- `fix nve/sphere`
- `fix gravity`

This compute

- `compute erotate/sphere`

calculates rotational kinetic energy which can be output with thermodynamic info.

Use one of these 3 pair potentials, which compute forces and torques between interacting pairs of particles:

- `pair_style gran/history`
- `pair_style gran/no_history`
- `pair_style gran/hertzian`

These commands implement fix options specific to granular systems:

- `fix freeze`
- `fix pour`
- `fix viscous`
- `fix wall/gran`

The fix style `freeze` zeroes both the force and torque of frozen atoms, and should be used for granular system instead of the fix style `setforce`.
For computational efficiency, you can eliminate needless pairwise computations between frozen atoms by using this command:

- `neigh_modify exclude`

**Note:** By default, for 2d systems, granular particles are still modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be the same as in 3d. If you wish to model granular particles in 2d as 2d discs, see the note on this topic on the *Howto 2d* doc page, where 2d simulations are discussed.

## 8.6.3 Body particles

**Overview:**

In LAMMPS, body particles are generalized finite-size particles. Individual body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. Note that other kinds of finite-size spherical and aspherical particles are also supported by LAMMPS, such as spheres, ellipsoids, line segments, and triangles, but they are simpler entities than body particles. See the *Howto spherical* doc page for a general overview of all these particle types.

Body particles are used via the `atom_style body` command. It takes a body style as an argument. The current body styles supported by LAMMPS are as follows. The name in the first column is used as the `bstyle` argument for the `atom_style body` command.

<table>
<thead>
<tr>
<th><code>bstyle</code></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>nparticle</code></td>
<td>rigid body with N sub-particles</td>

</tbody>
</table>

The body style determines what attributes are stored for each body and thus how they can be used to compute pairwise body/body or bond/non-body (point particle) interactions. More details of each style are described below.

More styles may be added in the future. See the *page on creating new body styles* for details on how to add a new body style to the code.

### When to use body particles:

You should not use body particles to model a rigid body made of simpler particles (e.g., point, sphere, ellipsoid, line segment, triangular particles), if the interaction between pairs of rigid bodies is just the summation of pairwise interactions between the simpler particles. LAMMPS already supports this kind of model via the `fix rigid` command. Any of the numerous pair styles that compute interactions between simpler particles can be used. The `fix rigid` command integrates the motion of the rigid bodies. All of the standard LAMMPS commands for thermostatting, adding constraints, performing output, etc will operate as expected on the simple particles.

By contrast, when body particles are used, LAMMPS treats an entire body as a single particle for purposes of computing pairwise interactions, building neighbor lists, migrating particles between processors, output of particles to a dump file, etc. This means that interactions between pairs of bodies or between a body and non-body (point) particle need to be encoded in an appropriate pair style. If such a pair style were to mimic the `fix rigid` model, it would need to loop over the entire collection of interactions between pairs of simple particles within the two bodies, each time a single body/body interaction was computed.

Thus it only makes sense to use body particles and develop such a pair style, when particle/particle interactions are more complex than what the `fix rigid` command can already calculate. For example, consider particles with one or more of the following attributes:

- represented by a surface mesh
represented by a collection of geometric entities (e.g. planes + spheres)

- deformable
- internal stress that induces fragmentation

For these models, the interaction between pairs of particles is likely to be more complex than the summation of simple pairwise interactions. An example is contact or frictional forces between particles with planar surfaces that interpenetrate. Likewise, the body particle may store internal state, such as a stress tensor used to compute a fracture criterion.

These are additional LAMMPS commands that can be used with body particles of different styles

The pair styles defined for use with specific body styles are listed in the sections below.

### Specifics of body style nparticle:

The nparticle body style represents body particles as a rigid body with a variable number N of sub-particles. It is provided as a vanilla, prototypical example of a body particle, although as mentioned above, the fix rigid command already duplicates its functionality.

The atom_style body command for this body style takes two additional arguments:

```
atom_style body nparticle Nmin Nmax
```

- Nmin = minimum # of sub-particles in any body in the system
- Nmax = maximum # of sub-particles in any body in the system

The Nmin and Nmax arguments are used to bound the size of data structures used internally by each particle.

When the read_data command reads a data file for this body style, the following information must be provided for each entry in the Bodies section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
```

where M = 6 + 3*N, and N is the number of sub-particles in the body particle.

The integer line has a single value N. The floating point line(s) list 6 moments of inertia followed by the coordinates of the N sub-particles (x1 to zN) as 3N values. These values can be listed on as many lines as you wish; see the read_data command for more details.

The 6 moments of inertia (ixx,iyy,izz,ixy,ixz,iyz) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally. The coordinates of each sub-particle are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass
position of the particle is specified by the x,y,z values in the Atoms section of the data file, as is the total mass of the body particle.

The pair_style body/nparticle command can be used with this body style to compute body/body and body/non-body interactions.

**Specifics of body style rounded/polygon:**

The rounded/polygon body style represents body particles as a 2d polygon with a variable number of N vertices. This style can only be used for 2d models; see the boundary command. See the “pair_style body/rounded/polygon” doc page for a diagram of two squares with rounded circles at the vertices. Special cases for N = 1 (circle) and N = 2 (rod with rounded ends) can also be specified.

One use of this body style is for 2d discrete element models, as described in Fraige.

Similar to body style nparticle, the atom_style body command for this body style takes two additional arguments:

```
atom_style body rounded/polygon Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system
```

The Nmin and Nmax arguments are used to bound the size of data structures used internally by each particle.

When the read_data command reads a data file for this body style, the following information must be provided for each body in the Bodies section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
diameter
```

where M = 6 + 3*N + 1, and N is the number of vertices in the body particle.

The integer line has a single value N. The floating point line(s) list 6 moments of inertia, followed by the coordinates of the N vertices (x1 to zN) as 3N values (with z = 0.0 for each), followed by a diameter value = the rounded diameter of the circle that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the read_data command for more details.

**Note:** It is important that the vertices for each polygonal body particle be listed in order around its perimeter, so that edges can be inferred. LAMMPS does not check that this is the case.

The 6 moments of inertia (ixx,iyy,izz,ixy,ixz,izy) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally. The coordinates of each vertex are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the Atoms section of the data file.

For example, the following information would specify a square particle whose edge length is sqrt(2) and rounded diameter is 1.0. The orientation of the square is aligned with the xy coordinate axes which is consistent with the 6 moments of inertia: ixx iyy izz ixy ixz iyz = 1 1 4 0 0 0. Note that only Izz matters in 2D simulations.

```
3 1 27
4
```
A rod in 2D, whose length is 4.0, mass 1.0, rounded at two ends by circles of diameter 0.5, is specified as follows:

```
1 1 13
2
1 1 1.33333 0 0 0
-2 0 0
2 0 0
0.5
```

A disk, whose diameter is 3.0, mass 1.0, is specified as follows:

```
1 1 10
1
1 1 4.5 0 0 0
0 0 0
3.0
```

The `pair_style body/rounded/polygon` command can be used with this body style to compute body/body interactions. The `fix wall/body/polygon` command can be used with this body style to compute the interaction of body particles with a wall.

### Specifics of body style rounded/polyhedron:

The `rounded/polyhedron` body style represents body particles as a 3d polyhedron with a variable number of N vertices, E edges and F faces. This style can only be used for 3d models; see the `boundary` command. See the “pair_style body/rounded/polygon” doc page for a diagram of a two 2d squares with rounded circles at the vertices. A 3d cube with rounded spheres at the 8 vertices and 12 rounded edges would be similar. Special cases for N = 1 (sphere) and N = 2 (rod with rounded ends) can also be specified.

This body style is for 3d discrete element models, as described in Wang.

Similar to body style `rounded/polygon`, the `atom_style body` command for this body style takes two additional arguments:

```
atom_style body rounded/polyhedron Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system
```

The Nmin and Nmax arguments are used to bound the size of data structures used internally by each particle.

When the `read_data` command reads a data file for this body style, the following information must be provided for each entry in the `Bodies` section of the data file:

```
atom-ID 3 M
N E F
ixx iyy izz ixy ixz iyz
x1 y1 z1
...  
xN yN zN
```
where $M = 6 + 3N + 2E + 4F + 1$, and $N$ is the number of vertices in the body particle, $E = number of$ $edges$, $F =$ $number of$ $faces$. For $N = 1$ or 2, the format is simpler. $E$ and $F$ are ignored and no edges or faces are listed, so that $M = 6 + 3N + 1$.

The integer line has three values: number of vertices (N), number of edges (E) and number of faces (F). The floating point line(s) list 6 moments of inertia followed by the coordinates of the N vertices (x1 to zN) as 3N values, followed by 2N vertex indices corresponding to the end points of the E edges, then 4*F vertex indices defining F faces. The last value is the diameter value = the rounded diameter of the sphere that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the read_data command for more details.

Note that vertices are numbered from 0 to N-1 inclusive. The order of the 2 vertices in each edge does not matter. Faces can be triangles or quadrilaterals. In both cases 4 vertices must be specified. For a triangle the 4th vertex is -1. The 4 vertices within each triangle or quadrilateral face should be ordered by the right-hand rule so that the normal vector of the face points outwards from the center of mass. For polyhedron with faces with more than 4 vertices, you should split the complex face into multiple simple faces, each of which is a triangle or quadrilateral.

Note: If a face is a quadrilateral then its 4 vertices must be co-planar. LAMMPS does not check that this is the case. If you have a quad-face of a polyhedron that is not planar (e.g. a cube whose vertices have been randomly displaced), then you should represent the single quad face as two triangle faces instead.

The 6 moments of inertia (ixx,iyy,izz,ixy,ixz,iyz) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally. The coordinates of each vertex are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the Atoms section of the data file.

For example, the following information would specify a cubic particle whose edge length is 2.0 and rounded diameter is 0.5. The orientation of the cube is aligned with the xyz coordinate axes which is consistent with the 6 moments of inertia: ixx iyy izz ixy ixz iyz = 0.667 0.667 0.667 0 0 0.

1379
8 12 6
0.667 0.667 0.667 0 0 0
1 1 1
1 -1 1
-1 -1 1
-1 1 1
1 1 -1
1 -1 -1
-1 -1 -1
-1 1 -1
0 1
1 2
A rod in 3D, whose length is 4.0, mass 1.0 and rounded at two ends by circles of diameter 0.5, is specified as follows:

```
1 3 13
2 1 1
0 1.33333 1.33333 0 0 0
-2 0 0
2 0 0
0.5
```

A sphere whose diameter is 3.0 and mass 1.0, is specified as follows:

```
1 3 10
1 1 1
0.9 0.9 0.9 0 0 0
0 0 0
3.0
```

The number of edges and faces for a rod or sphere must be listed, but is ignored.

The `pair_style body/rounded/polhedron` command can be used with this body style to compute body/body interactions. The `fix wall/body/polhedron` command can be used with this body style to compute the interaction of body particles with a wall.

**Output specifics for all body styles:**

For the `compute body/local` and `dump local` commands, all 3 of the body styles described on this page produces one datum for each of the N vertices (of sub-particles) in a body particle. The datum has 3 values:

```
1 = x position of vertex (or sub-particle)
2 = y position of vertex
3 = z position of vertex
```

These values are the current position of the vertex within the simulation domain, not a displacement from the center-of-mass (COM) of the body particle itself. These values are calculated using the current COM and orientation of the body particle.

The `dump image` command and its `body` keyword can be used to render body particles.
For the *nparticle* body style, each body is drawn as a collection of spheres, one for each sub-particle. The size of each sphere is determined by the *bflag1* parameter for the *body* keyword. The *bflag2* argument is ignored.

For the *rounded/polygon* body style, each body is drawn as a polygon with N line segments. For the *rounded/polyhedron* body style, each face of each body is drawn as a polygon with N line segments. The drawn diameter of each line segment is determined by the *bflag1* parameter for the *body* keyword. The *bflag2* argument is ignored.

Note that for both the *rounded/polygon* and *rounded/polyhedron* styles, line segments are drawn between the pairs of vertices. Depending on the diameters of the line segments this may be slightly different than the physical extent of the body as calculated by the *pair_style rounded/polygon* or *pair_style rounded/polyhedron* commands. Conceptually, the pair styles define the surface of a 2d or 3d body by lines or planes that are tangent to the finite-size spheres of specified diameter which are placed on each vertex position.

---

### 8.6.4 Polarizable models

In polarizable force fields the charge distributions in molecules and materials respond to their electrostatic environments. Polarizable systems can be simulated in LAMMPS using three methods:

- the fluctuating charge method, implemented in the *QEQ* package,
- the adiabatic core-shell method, implemented in the *CORESHELL* package,
- the thermalized Drude dipole method, implemented in the *USER-DRUDE* package.

The fluctuating charge method calculates instantaneous charges on interacting atoms based on the electronegativity equalization principle. It is implemented in the *fix qeq* which is available in several variants. It is a relatively efficient technique since no additional particles are introduced. This method allows for charge transfer between molecules or atom groups. However, because the charges are located at the interaction sites, off-plane components of polarization cannot be represented in planar molecules or atom groups.

The two other methods share the same basic idea: polarizable atoms are split into one core atom and one satellite particle (called shell or Drude particle) attached to it by a harmonic spring. Both atoms bear a charge and they represent collectively an induced electric dipole. These techniques are computationally more expensive than the QEq method because of additional particles and bonds. These two charge-on-spring methods differ in certain features, with the core-shell model being normally used for ionic/crystalline materials, whereas the so-called Drude model is normally used for molecular systems and fluid states.

The core-shell model is applicable to crystalline materials where the high symmetry around each site leads to stable trajectories of the core-shell pairs. However, bonded atoms in molecules can be so close that a core would interact too strongly or even capture the Drude particle of a neighbor. The Drude dipole model is relatively more complex in order to remedy this and other issues. Specifically, the Drude model includes specific thermostatting of the core-Drude pairs and short-range damping of the induced dipoles.

The three polarization methods can be implemented through a self-consistent calculation of charges or induced dipoles at each timestep. In the fluctuating charge scheme this is done by the matrix inversion method in *fix qeq/point*, but for core-shell or Drude-dipoles the relaxed-dipoles technique would require an slow iterative procedure. These self-consistent solutions yield accurate trajectories since the additional degrees of freedom representing polarization are massless. An alternative is to attribute a mass to the additional degrees of freedom and perform time integration using an extended Lagrangian technique. For the fluctuating charge scheme this is done by *fix qeq/dynamic*, and for the charge-on-spring models by the methods outlined in the next two sections. The assignment of masses to the additional degrees of freedom can lead to unphysical trajectories if care is not exerted in choosing the parameters of the polarizable models and the simulation conditions.
In the core-shell model the vibration of the shells is kept faster than the ionic vibrations to mimic the fast response of the polarizable electrons. But in molecular systems thermalizing the core-Drude pairs at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, too short a timestep, etc.) In order to avoid these problems the relative motion of the Drude particles with respect to their cores is kept “cold” so the vibration of the core-Drude pairs is very slow, approaching the self-consistent regime. In both models the temperature is regulated using the velocities of the center of mass of core+shell (or Drude) pairs, but in the Drude model the actual relative core-Drude particle motion is thermostatted separately as well.

8.6.5 Adiabatic core/shell model

The adiabatic core-shell model by Mitchell and Fincham is a simple method for adding polarizability to a system. In order to mimic the electron shell of an ion, a satellite particle is attached to it. This way the ions are split into a core and a shell where the latter is meant to react to the electrostatic environment inducing polarizability. See the Howto polarizable doc page for a discussion of all the polarizable models available in LAMMPS.

Technically, shells are attached to the cores by a spring force \( f = k r \) where \( k \) is a parameterized spring constant and \( r \) is the distance between the core and the shell. The charges of the core and the shell add up to the ion charge, thus \( q(\text{ion}) = q(\text{core}) + q(\text{shell}) \). This setup introduces the ion polarizability (\( \alpha \)) given by \( \alpha = \frac{q(\text{shell})^2}{k} \). In a similar fashion the mass of the ion is distributed on the core and the shell with the core having the larger mass.

To run this model in LAMMPS, \textit{atom_style full} can be used since atom charge and bonds are needed. Each kind of core/shell pair requires two atom types and a bond type. The core and shell of a core/shell pair should be bonded to each other with a harmonic bond that provides the spring force. For example, a data file for NaCl, as found in examples/coreshell, has this format:

432  atoms  # core and shell atoms
216  bonds  # number of core/shell springs
4   atom types  # 2 cores and 2 shells for Na and Cl
  2  bond types

0.0 24.09597 xlo xhi

  pair 2
(...)

Bonds  # Bond topology for spring forces

(continues on next page)
Non-Coulombic (e.g. Lennard-Jones) pairwise interactions are only defined between the shells. Coulombic interactions are defined between all cores and shells. If desired, additional bonds can be specified between cores.

The special_bonds command should be used to turn-off the Coulombic interaction within core/shell pairs, since that interaction is set by the bond spring. This is done using the special_bonds command with a 1-2 weight = 0.0, which is the default value. It needs to be considered whether one has to adjust the special_bonds weighting according to the molecular topology since the interactions of the shells are bypassed over an extra bond.

Note that this core/shell implementation does not require all ions to be polarized. One can mix core/shell pairs and ions without a satellite particle if desired.

Since the core/shell model permits distances of \( r = 0.0 \) between the core and shell, a pair style with a “cs” suffix needs to be used to implement a valid long-range Coulombic correction. Several such pair styles are provided in the CORESHELL package. See this doc page for details. All of the core/shell enabled pair styles require the use of a long-range Coulombic solver, as specified by the kspace_style command. Either the PPPM or Ewald solvers can be used.

For the NaCl example problem, these pair style and bond style settings are used:

```plaintext
pair_style  born/coul/long/cs 20.0 20.0  
pair_coeff  *  *  0.0 1.000 0.00 0.00 0.00  
pair_coeff  3 3 487.0 0.23768 0.00 1.05 0.50  #Na-Na  
pair_coeff  3 4 145134.0 0.23768 0.00 6.99 8.70  #Na-Cl  
pair_coeff  4 4 405774.0 0.23768 0.00 72.40 145.40  #Cl-Cl  

bond_style  harmonic  
bond_coeff  1 63.014 0.0  
bond_coeff  2 25.724 0.0  
```

When running dynamics with the adiabatic core/shell model, the following issues should be considered. The relative motion of the core and shell particles corresponds to the polarization, hereby an instantaneous relaxation of the shells is approximated and a fast core/shell spring frequency ensures a nearly constant internal kinetic energy during the simulation. Thermostats can alter this polarization behavior, by scaling the internal kinetic energy, meaning the shell will not react freely to its electrostatic environment. Therefore it is typically desirable to decouple the relative motion of the core/shell pair, which is an imaginary degree of freedom, from the real physical system. To do that, the compute temp/cs command can be used, in conjunction with any of the thermostat fixes, such as fix nvt or fix langevin. This compute uses the center-of-mass velocity of the core/shell pairs to calculate a temperature, and insures that velocity is what is rescaled for thermostating purposes. This compute also works for a system with both core/shell pairs and non-polarized ions (ions without an attached satellite particle). The compute temp/cs command requires input of two groups, one for the core atoms, another for the shell atoms. Non-polarized ions which might also be included in the treated system should not be included into either of these groups, they are taken into account by the group-ID (second argument) of the compute. The groups can be defined using the group *type* command. Note that to perform thermostating using this definition of temperature, the fix modify temp command should be used to assign the compute to the thermostat fix. Likewise the thermo_modify temp command can be used to make this temperature be output for the overall system.

For the NaCl example, this can be done as follows:

```plaintext

group cores type 1 2  
group shells type 3 4  
compute CSeq all temp/cs cores shells  
fix thermoberendsen all temp/berendsen 1427 1427 0.4  # thermostat for the true  
     physical system  
```
The pressure for the core/shell system is computed via the regular LAMMPS convention by treating the cores and shells as individual particles. For the thermo output of the pressure as well as for the application of a barostat, it is necessary to use an additional pressure compute based on the default temperature and specifying it as a second argument in fix modify and thermo modify resulting in:

```
compute CSequ all temp/cs cores shells
compute thermo_press_lmp all pressure thermo_temp # pressure for individual particles
thermo_modify temp CSequ press thermo_press_lmp # modify thermo to regular pressure
fix press_bar all npt temp 300 300 0.04 iso 0 0 0.4
fix modify press_bar temp CSequ press thermo_press_lmp # pressure modification for correct kinetic scalar
```

If compute temp/cs is used, the decoupled relative motion of the core and the shell should in theory be stable. However numerical fluctuation can introduce a small momentum to the system, which is noticeable over long trajectories. Therefore it is recommendable to use the fix momentum command in combination with compute temp/cs when equilibrating the system to prevent any drift.

When initializing the velocities of a system with core/shell pairs, it is also desirable to not introduce energy into the relative motion of the core/shell particles, but only assign a center-of-mass velocity to the pairs. This can be done by using the bias keyword of the velocity create command and assigning the compute temp/cs command to the temp keyword of the velocity command, e.g.

```
velocity all create 1427 134 bias yes temp CSequ
velocity all scale 1427 temp CSequ
```

To maintain the correct polarizability of the core/shell pairs, the kinetic energy of the internal motion shall remain nearly constant. Therefore the choice of spring force and mass ratio need to ensure much faster relative motion of the 2 atoms within the core/shell pair than their center-of-mass velocity. This allows the shells to effectively react instantaneously to the electrostatic environment and limits energy transfer to or from the core/shell oscillators. This fast movement also dictates the timestep that can be used.

The primary literature of the adiabatic core/shell model suggests that the fast relative motion of the core/shell pairs only allows negligible energy transfer to the environment. The mentioned energy transfer will typically lead to a small drift in total energy over time. This internal energy can be monitored using the compute chunk/atom and compute temp/chunk commands. The internal kinetic energies of each core/shell pair can then be summed using the sum() special function of the variable command. Or they can be time/averaged and output using the fix ave/time command.

To use these commands, each core/shell pair must be defined as a “chunk”. If each core/shell pair is defined as its own molecule, the molecule ID can be used to define the chunks. If cores are bonded to each other to form larger molecules, the chunks can be identified by the fix property/atom via assigning a core/shell ID to each atom using a special field in the data file read by the read_data command. This field can then be accessed by the compute property/atom command, to use as input to the compute chunk/atom command to define the core/shell pairs as chunks.

For example if core/shell pairs are the only molecules:

```
read_data NaCl_CS_x0.1_prop.data
compute prop all property/atom molecule
compute cs_chunk all chunk/atom c_prop
```
For example if core/shell pairs and other molecules are present:

```
fix csinfo all property/atom i_CSID # property/atom command
read_data NaCl_CS_x0.1_prop.data fix csinfo NULL CS-Info # atom property added in
the data-file
compute prop all property/atom i_CSID

The additional section in the date file would be formatted like this:
```

<table>
<thead>
<tr>
<th>CS-Info</th>

```

**8.6.6 Drude induced dipoles**

The thermalized Drude model represents induced dipoles by a pair of charges (the core atom and the Drude particle) connected by a harmonic spring. See the *Howto polarizable* doc page for a discussion of all the polarizable models available in LAMMPS.

The Drude model has a number of features aimed at its use in molecular systems (*Lamoureux and Roux*):

- Thermostatting of the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.

- Consistent definition of 1-2 to 1-4 neighbors. A core-Drude particle pair represents a single (polarizable) atom, so the special screening factors in a covalent structure should be the same for the core and the Drude particle. Drude particles have to inherit the 1-2, 1-3, 1-4 special neighbor relations from their respective cores.

- Stabilization of the interactions between induced dipoles. Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short range can be done by Thole functions (for which there are physical grounds). This Thole damping is applied to the point charges composing the induced dipole (the charge of the Drude particle and the opposite charge on the core, not to the total charge of the core atom).

A detailed tutorial covering the usage of Drude induced dipoles in LAMMPS is on the [here](#).
As with the core-shell model, the cores and Drude particles should appear in the data file as standard atoms. The same holds for the springs between them, which are described by standard harmonic bonds. The nature of the atoms (core, Drude particle or non-polarizable) is specified via the `fix drude` command. The special list of neighbors is automatically refactored to account for the equivalence of core and Drude particles as regards special 1-2 to 1-4 screening. It may be necessary to use the `extra/special/per/atom` keyword of the `read_data` command. If using `fix shake`, make sure no Drude particle is in this fix group.

There are two ways to thermostat the Drude particles at a low temperature: use either `fix langevin/drude` for a Langevin thermostat, or `fix drude/transform/*` for a Nose-Hoover thermostat. The former requires use of the command `comm_modify vel yes`. The latter requires two separate integration fixes like `nvt` or `npt`. The correct temperatures of the reduced degrees of freedom can be calculated using the `compute temp/drude`. This requires also to use the command `comm_modify vel yes`.

Short-range damping of the induced dipole interactions can be achieved using Thole functions through the `pair style thole` in `pair_style hybrid/overlay` with a Coulomb pair style. It may be useful to use `coul/long/cs` or similar from the CORESHELL package if the core and Drude particle come too close, which can cause numerical issues.

---

8.6.7 Tutorial for Thermalized Drude oscillators in LAMMPS

This tutorial explains how to use Drude oscillators in LAMMPS to simulate polarizable systems using the USER-DRUDE package. As an illustration, the input files for a simulation of 250 phenol molecules are documented. First of all, LAMMPS has to be compiled with the USER-DRUDE package activated. Then, the data file and input scripts have to be modified to include the Drude dipoles and how to handle them.

Overview of Drude induced dipoles

Polarizable atoms acquire an induced electric dipole moment under the action of an external electric field, for example the electric field created by the surrounding particles. Drude oscillators represent these dipoles by two fixed charges: the core (DC) and the Drude particle (DP) bound by a harmonic potential. The Drude particle can be thought of as the electron cloud whose center can be displaced from the position of the corresponding nucleus.

The sum of the masses of a core-Drude pair should be the mass of the initial (unsplit) atom, \( m_C + m_D = m \). The sum of their charges should be the charge of the initial (unsplit) atom, \( q_C + q_D = q \). A harmonic potential between the core and Drude partners should be present, with force constant \( k_D \) and an equilibrium distance of zero. The (half-)stiffness of the harmonic bond \( K_D = k_D/2 \) and the Drude charge \( q_D \) are related to the atom polarizability \( \alpha \) by

\[
K_D = \frac{1}{2} \frac{q_D^2}{\alpha}
\]

Ideally, the mass of the Drude particle should be small, and the stiffness of the harmonic bond should be large, so that the Drude particle remains close to the core. The values of Drude mass, Drude charge, and force constant can be chosen following different strategies, as in the following examples of polarizable force fields:

- Lamoureux and Roux suggest adopting a global half-stiffness, \( K_D = 500 \text{ kcal/(mol Ang}^2) \) - which corresponds to a force constant \( k_D = 4184 \text{ kJ/(mol Ang}^2) \) - for all types of core-Drude bond, a global mass \( m_D = 0.4 \text{ g/mol} \) (or u) for all types of Drude particles, and to calculate the Drude charges for individual atom types from the atom polarizabilities using equation (1). This choice is followed in the polarizable CHARMM force field.

- Alternately Schroeder and Steinhauser suggest adopting a global charge \( q_D = -1.0e \) and a global mass \( m_D = 0.1 \text{ g/mol} \) (or u) for all Drude particles, and to calculate the force constant for each type of core-Drude bond from equation (1). The timesteps used by these authors are between 0.5 and 2 fs, with the degrees of freedom of the Drude oscillators kept cold at 1 K.
• In both these force fields hydrogen atoms are treated as non-polarizable.

The motion of the Drude particles can be calculated by minimizing the energy of the induced dipoles at each timestep, by an iterative, self-consistent procedure. The Drude particles can be massless and therefore do not contribute to the kinetic energy. However, the relaxed method is computational slow. An extended-lagrangian method can be used to calculate the positions of the Drude particles, but this requires them to have mass. It is important in this case to decouple the degrees of freedom associated with the Drude oscillators from those of the normal atoms. Thermalizing the Drude dipoles at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, very short timestep, etc.), which can be remedied by the “cold Drude” technique (Lamoureux and Roux).

Two closely related models are used to represent polarization through “charges on a spring”: the core-shell model and the Drude model. Although the basic idea is the same, the core-shell model is normally used for ionic/crystalline materials, whereas the Drude model is normally used for molecular systems and fluid states. In ionic crystals the symmetry around each ion and the distance between them are such that the core-shell model is sufficiently stable. But to be applicable to molecular/covalent systems the Drude model includes two important features:

1. The possibility to thermostat the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.
2. The Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle (shell) of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short of the interactions between the point charges composing the induced dipole can be done by Thole functions.

**Preparation of the data file**

The data file is similar to a standard LAMMPS data file for atom_style full. The DPs and the harmonic bonds connecting them to their DC should appear in the data file as normal atoms and bonds.

You can use the polarizer tool (Python script distributed with the USER-DRUDE package) to convert a non-polarizable data file (here data.102494.lmp) to a polarizable data file (data-p.lmp)

```
polarizer -q -f phenol.dff data.102494.lmp data-p.lmp
```

This will automatically insert the new atoms and bonds. The masses and charges of DCs and DPs are computed from phenol.dff, as well as the DC-DP bond constants. The file phenol.dff contains the polarizabilities of the atom types and the mass of the Drude particles, for instance:

```bash
# units: kJ/mol, A, deg
# kforce is in the form k/2 r_D^2
# type  m_D/u  q_D/e  k_D  alpha/A3  thole
OH  0.4  -1.0  4184.0  0.63  0.67
CA  0.4   -1.0  4184.0  1.36  2.51
CAI 0.4  -1.0  4184.0  1.09  2.51
```

The hydrogen atoms are absent from this file, so they will be treated as non-polarizable atoms. In the non-polarizable data file data.102494.lmp, atom names corresponding to the atom type numbers have to be specified as comments at the end of lines of the Masses section. You probably need to edit it to add these names. It should look like

```
Masses
1 12.011 # CAI
2 12.011 # CA
3 15.999 # OH
4 1.008  # HA
5 1.008  # HO
```

---

8.6. Packages howto 273
Basic input file

The atom style should be set to (or derive from) full, so that you can define atomic charges and molecular bonds, angles, dihedrals...

The polarizer tool also outputs certain lines related to the input script (the use of these lines will be explained below). In order for LAMMPS to recognize that you are using Drude oscillators, you should use the fix drude. The command is

```plaintext
fix DRUDE all drude C C C N N D D D
```

The N, C, D following the drude keyword have the following meaning: There is one tag for each atom type. This tag is C for DCs, D for DPs and N for non-polarizable atoms. Here the atom types 1 to 3 (C and O atoms) are DC, atom types 4 and 5 (H atoms) are non-polarizable and the atom types 6 to 8 are the newly created DPs.

By recognizing the fix drude, LAMMPS will find and store matching DC-DP pairs and will treat DP as equivalent to their DC in the special bonds relations. It may be necessary to extend the space for storing such special relations. In this case extra space should be reserved by using the extra/special/per/atom keyword of either the read_data or create_box command. With our phenol, there is 1 more special neighbor for which space is required. Otherwise LAMMPS crashes and gives the required value.

```plaintext
read_data data-p.lmp extra/special/per/atom 1
```

Let us assume we want to run a simple NVT simulation at 300 K. Note that Drude oscillators need to be thermalized at a low temperature in order to approximate a self-consistent field (SCF), therefore it is not possible to simulate an NVE ensemble with this package. Since dipoles are approximated by a charged DC-DP pair, the pair_style must include Coulomb interactions, for instance lj/cut/coul/long with kspace_style pppm. For example, with a cutoff of 10. and a precision 1.e-4:

```plaintext
pair_style lj/cut/coul/long 10.0
kspace_style pppm 1.0e-4
```

As compared to the non-polarizable input file, pair_coeff lines need to be added for the DPs. Since the DPs have no Lennard-Jones interactions, their $\epsilon$ is 0. so the only pair_coeff line that needs to be added is

```plaintext
pair_coeff * 6* 0.0 0.0 # All-DPs
```

Now for the thermalization, the simplest choice is to use the fix langevin/drude.

```plaintext
fix LANG all langevin/drude 300. 100 12345 1. 20 13977
```

This applies a Langevin thermostat at temperature 300. to the centers of mass of the DC-DP pairs, with relaxation time 100 and with random seed 12345. This fix applies also a Langevin thermostat at temperature 1. to the relative motion of the DPs around their DCs, with relaxation time 20 and random seed 13977. Only the DCs and non-polarizable atoms need to be in this fix’s group. LAMMPS will thermostat the DPs together with their DC. For this, ghost atoms need to know their velocities. Thus you need to add the following command:

```plaintext
comm_modify vel yes
```

In order to avoid that the center of mass of the whole system drifts due to the random forces of the Langevin thermostat on DCs, you can add the zero yes option at the end of the fix line.

If the fix shake is used to constrain the C-H bonds, it should be invoked after the fix langevin/drude for more accuracy.

```plaintext
fix SHAKE ATOMS shake 0.0001 20 0 t 4 5
```
**Note:** The group of the fix *shake* must not include the DPs. If the group *ATOMS* is defined by non-DPs atom types, you could use

Since the fix *langevin/drude* does not perform time integration (just modification of forces but no position/velocity updates), the fix *nve* should be used in conjunction.

```plaintext
fix NVE all nve
```

Finally, do not forget to update the atom type elements if you use them in a *dump_modify* command, by adding the element type of the DPs. Here for instance

```plaintext
dump DUMP all custom 10 dump.lammpstrj id mol type element x y z ix iy iz
dump_modify DUMP element C C O H H D D D
```

The input file should now be ready for use!

You will notice that the global temperature *thermo_temp* computed by LAMMPS is not 300. K as wanted. This is because LAMMPS treats DPs as standard atoms in its default compute. If you want to output the temperatures of the DC-DP pair centers of mass and of the DPs relative to their DCs, you should use the *compute temp_drude* command.

```plaintext
compute TDRUDE all temp/drude
```

And then output the correct temperatures of the Drude oscillators using *thermo_style custom* with respectively \(c_{TDRUDE}[1]\) and \(c_{TDRUDE}[2]\). These should be close to 300.0 and 1.0 on average.

```plaintext
thermo_style custom step temp c_{TDRUDE}[1] c_{TDRUDE}[2]
```

### Thole screening

Dipolar interactions represented by point charges on springs may not be stable, for example if the atomic polarizability is too high for instance, a DP can escape from its DC and be captured by another DC, which makes the force and energy diverge and the simulation crash. Even without reaching this extreme case, the correlation between nearby dipoles on the same molecule may be exaggerated. Often, special bond relations prevent bonded neighboring atoms to see the charge of each other’s DP, so that the problem does not always appear. It is possible to use screened dipole-dipole interactions by using the *pair_style thole*. This is implemented as a correction to the Coulomb pair styles, which dampens at short distance the interactions between the charges representing the induced dipoles. It is to be used as *hybrid/overlay* with any standard *coul* pair style. In our example, we would use

```plaintext
pair_style hybrid/overlay lj/cut/coul/long 10.0 thole 2.6 10.0
```

This tells LAMMPS that we are using two *pair_styles*. The first one is as above (*lj/cut/coul/long 10.0*). The second one is a *thole* pair style with default screening factor 2.6 (*Noskov*) and cutoff 10.0.

Since *hybrid/overlay* does not support mixing rules, the interaction coefficients of all the pairs of atom types with \(i < j\) should be explicitly defined. The output of the *polarizer* script can be used to complete the *pair_coeff* section of the input file. In our example, this will look like:

```plaintext
pair_coeff 1 1 lj/cut/coul/long 0.0700 3.550
pair_coeff 1 2 lj/cut/coul/long 0.0700 3.550
pair_coeff 1 3 lj/cut/coul/long 0.1091 3.310
pair_coeff 1 4 lj/cut/coul/long 0.0458 2.985
pair_coeff 2 2 lj/cut/coul/long 0.0700 3.550
pair_coeff 2 3 lj/cut/coul/long 0.1091 3.310
pair_coeff 2 4 lj/cut/coul/long 0.0458 2.985
```

(continues on next page)
For the \textit{thole} pair style the coefficients are

1. the atom polarizability in units of cubic length
2. the screening factor of the Thole function (optional, default value specified by the pair\_style command)
3. the cutoff (optional, default value defined by the pair\_style command)

The special neighbors have charge-charge and charge-dipole interactions screened by the \textit{coul} factors of the \textit{special\_bonds} command (0.0, 0.0, and 0.5 in the example above). Without using the pair\_style \textit{thole}, dipole-dipole interactions are screened by the same factor. By using the pair\_style \textit{thole}, dipole-dipole interactions are screened by Thole’s function, whatever their special relationship (except within each DC-DP pair of course). Consider for example 1-2 neighbors: using the pair\_style \textit{thole}, their dipoles will see each other (despite the \textit{coul} factor being 0.) and the interactions between these dipoles will be damped by Thole’s function.

---

**Thermostats and barostats**

Using a Nose-Hoover barostat with the \textit{langevin/drude} thermostat is straightforward using fix \textit{nph} instead of \textit{nve}. For example:

```
fix NPH all nph iso 1. 1. 500
```

It is also possible to use a Nose-Hoover instead of a Langevin thermostat. This requires to use \textit{*fix drude/transform*} just before and after the time integration fixes. The \textit{fix drude/transform/direct} converts the atomic masses, positions, velocities and forces into a reduced representation, where the DCs transform into the centers of mass of the DC-DP pairs and the DPs transform into their relative position with respect to their DC. The \textit{fix drude/transform/inverse} performs the reverse transformation. For a NVT simulation, with the DCs and atoms at 300 K and the DPs at 1 K relative to their DC one would use

</tbody>
</table>
fix DIRECT all drude/transform/direct
fix NVT1 ATOMS nvt temp 300. 300. 100
fix NVT2 DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse

For our phenol example, the groups would be defined as

<table>
<thead>
<tr>
<th>Group</th>
<th>Type</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATOMS</td>
<td>1 2 3 4 5</td>
<td># DCs and non-polarizable atoms</td>
</tr>
<tr>
<td>CORES</td>
<td>1 2 3</td>
<td># DCs</td>
</tr>
<tr>
<td>DRUDES</td>
<td>6 7 8</td>
<td># DPs</td>
</tr>
</tbody>
</table>

Note that with the fixes *drude/transform*, it is not required to specify *comm_modify vel yes* because the fixes do it anyway (several times and for the forces also). To avoid the flying ice cube artifact ([Lamoureux and Roux](https://example.com)), where the atoms progressively freeze and the center of mass of the whole system drifts faster and faster, the *fix momentum* can be used. For instance:

```
fix MOMENTUM all momentum 100 linear 1 1 1
```

It is a bit more tricky to run a NPT simulation with Nose-Hoover barostat and thermostat. First, the volume should be integrated only once. So the fix for DCs and atoms should be *npt* while the fix for DPs should be *nvt* (or vice versa). Second, the *fix npt* computes a global pressure and thus a global temperature whatever the fix group. We do want the pressure to correspond to the whole system, but we want the temperature to correspond to the fix group only. We must then use the *fix modify* command for this. In the end, the block of instructions for thermostating and barostatting will look like

```
compute TATOMS ATOMS temp
fix DIRECT all drude/transform/direct
fix NPT ATOMS npt temp 300. 300. 100 iso 1. 1. 500
fix_modify NPT temp TATOMS press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

**Rigid bodies**

You may want to simulate molecules as rigid bodies (but polarizable). Common cases are water models such as *SWM4-NDP*, which is a kind of polarizable TIP4P water. The rigid bodies and the DPs should be integrated separately, even with the Langevin thermostat. Let us review the different thermostats and ensemble combinations.

**NVT ensemble using Langevin thermostat:**

```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nve/small molecule
fix NVE DRUDES nve
```

**NVT ensemble using Nose-Hoover thermostat:**

```
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/nvt/small molecule temp 300. 300. 100
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

**NPT ensemble with Langevin thermostat:**

```
```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nph/small molecule iso 1. 1. 500
fix NVE DRUDES nve

NPT ensemble using Nose-Hoover thermostat:

compute TATOM ATOMS temp
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/npt/small molecule temp 300. 300. 100 iso 1. 1. 500
fix_modify RIGID temp TATOM press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse

8.6.8 Manifolds (surfaces)

Overview:

This doc page is not about a LAMMPS input script command, but about manifolds, which are generalized surfaces, as defined and used by the USER-MANIFOLD package, to track particle motion on the manifolds. See the src/USER-MANIFOLD/README file for more details about the package and its commands.

Below is a list of currently supported manifolds by the USER-MANIFOLD package, their parameters and a short description of them. The parameters listed here are in the same order as they should be passed to the relevant fixes.
### Manifold Parameters

### 8.6.9 Magnetic spins

The magnetic spin simulations are enabled by the SPIN package, whose implementation is detailed in Tranchida.

The model represents the simulation of atomic magnetic spins coupled to lattice vibrations. The dynamics of those magnetic spins can be used to simulate a broad range a phenomena related to magneto-elasticity, or or to study the influence of defects on the magnetic properties of materials.

The magnetic spins are interacting with each others and with the lattice via pair interactions. Typically, the magnetic exchange interaction can be defined using the pair/spin/exchange command. This exchange applies a magnetic torque to a given spin, considering the orientation of its neighboring spins and their relative distances. It also applies a force on the atoms as a function of the spin orientations and their associated inter-atomic distances.
The command `fix precession/spin` allows to apply a constant magnetic torque on all the spins in the system. This torque can be an external magnetic field (Zeeman interaction), or an uniaxial magnetic anisotropy.

A Langevin thermostat can be applied to those magnetic spins using `fix langevin/spin`. Typically, this thermostat can be coupled to another Langevin thermostat applied to the atoms using `fix langevin` in order to simulate thermostatted spin-lattice systems.

The magnetic Gilbert damping can also be applied using `fix langevin/spin`. It allows to either dissipate the thermal energy of the Langevin thermostat, or to perform a relaxation of the magnetic configuration toward an equilibrium state.

The command `fix setforce/spin` allows to set the components of the magnetic precession vectors (while erasing and replacing the previously computed magnetic precession vectors on the atom). This command can be used to freeze the magnetic moment of certain atoms in the simulation by zeroing their precession vector.

The command `fix nve/spin` can be used to perform a symplectic integration of the combined dynamics of spins and atomic motions.

The minimization style `min/spin` can be applied to the spins to perform a minimization of the spin configuration.

All the computed magnetic properties can be output by two main commands. The first one is `compute spin`, that enables to evaluate magnetic averaged quantities, such as the total magnetization of the system along x, y, or z, the spin temperature, or the magnetic energy. The second command is `compute property/atom`. It enables to output all the per atom magnetic quantities. Typically, the orientation of a given magnetic spin, or the magnetic force acting on this spin.

The LAMMPS distribution includes an examples sub-directory with many sample problems. Many are 2d models that run quickly and are straightforward to visualize, requiring at most a couple of minutes to run on a desktop machine. Each problem has an input script (in.*) and produces a log file (log.*) when it runs. Some use a data file (data.*) of initial coordinates as additional input. A few sample log file run on different machines and different numbers of processors are included in the directories to compare your answers to. E.g. a log file like log.date.crack.foo.P means the “crack” example was run on P processors of machine “foo” on that date (i.e. with that version of LAMMPS).

Many of the input files have commented-out lines for creating dump files and image files.

If you uncomment the dump command in the input script, a text dump file will be produced, which can be animated by various visualization programs.

If you uncomment the dump image command in the input script, and assuming you have built LAMMPS with a JPG library, JPG snapshot images will be produced when the simulation runs. They can be quickly post-processed into a movie using commands described on the dump image doc page.

Animations of many of the examples can be viewed on the Movies section of the LAMMPS web site.

There are two kinds of sub-directories in the examples folder. Lower case named directories contain one or a few simple, quick-to-run problems. Upper case named directories contain up to several complex scripts that illustrate a particular kind of simulation method or model. Some of these run for longer times, e.g. to measure a particular quantity.

Lists of both kinds of directories are given below.

## 9.1 Lowercase directories

<table>
<thead>
<tr>
<th>Directory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accelerate</td>
<td>run with various acceleration options (OpenMP, GPU, Phi)</td>
</tr>
<tr>
<td>airebo</td>
<td>polyethylene with AIREBO potential</td>
</tr>
<tr>
<td>atm</td>
<td>Axilrod-Teller-Muto potential example</td>
</tr>
<tr>
<td>balance</td>
<td>dynamic load balancing, 2d system</td>
</tr>
<tr>
<td>body</td>
<td>body particles, 2d system</td>
</tr>
<tr>
<td>cmap</td>
<td>CMAP 5-body contributions to CHARMM force field</td>
</tr>
<tr>
<td>colloid</td>
<td>big colloid particles in a small particle solvent, 2d system</td>
</tr>
<tr>
<td>comb</td>
<td>models using the COMB potential</td>
</tr>
<tr>
<td>controller</td>
<td>use of fix controller as a thermostat</td>
</tr>
<tr>
<td>coreshell</td>
<td>core/shell model using CORESHELL package</td>
</tr>
<tr>
<td>crack</td>
<td>crack propagation in a 2d solid</td>
</tr>
<tr>
<td>deposit</td>
<td>deposit atoms and molecules on a surface</td>
</tr>
</tbody>
</table>

continues on next page
Here is how you can run and visualize one of the sample problems:

```bash
cd indent
cp ../../src/lmp_linux .  # copy LAMMPS executable to this dir
lmp_linux -in in.indent  # run the problem
```

Running the simulation produces the files `dump.indent` and `log.lammps`. You can visualize the dump file of snapshots with a variety of third-party tools highlighted on the Visualization page of the LAMMPS web site.

<tr>
<td>voronoi</td>
<td>Voronoi tesselation via compute voronoi/atom command</td>
</tr>
</tbody>
</table>
If you uncomment the *dump image* line(s) in the input script a series of JPG images will be produced by the run (assuming you built LAMMPS with JPG support; see the *Build_settings* doc page for details). These can be viewed individually or turned into a movie or animated by tools like ImageMagick or QuickTime or various Windows-based tools. See the *dump image* doc page for more details. E.g. this Imagemagick command would create a GIF file suitable for viewing in a browser.

```bash
% convert -loop 1 *.jpg foo.gif
```

</tbody>
</table>

Nearly all of these directories have README files which give more details on how to understand and use their contents.

The USER directory has a large number of sub-directories which correspond by name to a USER package. They contain scripts that illustrate how to use the command(s) provided in that package. Many of the sub-directories have their own README files which give further instructions. See the *Packages_details* doc page for more info on specific USER packages.
LAMMPS is designed to be a computational kernel for performing molecular dynamics computations. Additional pre- and post-processing steps are often necessary to setup and analyze a simulation. A list of such tools can be found on the LAMMPS webpage at these links:

- Pre/Post processing
- Offsite LAMMPS packages & tools
- Pizza.py toolkit

The last link for Pizza.py is a Python-based tool developed at Sandia which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations.

Additional tools included in the LAMMPS distribution are described on this page.

Note that many users write their own setup or analysis tools or use other existing codes and convert their output to a LAMMPS input format or vice versa. The tools listed here are included in the LAMMPS distribution as examples of auxiliary tools. Some of them are not actively supported by the LAMMPS developers, as they were contributed by LAMMPS users. If you have problems using them, we can direct you to the authors.

The source code for each of these codes is in the tools sub-directory of the LAMMPS distribution. There is a Makefile (which you may need to edit for your platform) which will build several of the tools which reside in that directory. Most of them are larger packages in their own sub-directories with their own Makefiles and/or README files.

10.3 Miscellaneous tools

| CMake | emacs | i-pi | kate | singularity | vim |

10.4 Tool descriptions

10.4.1 amber2lmp tool

The amber2lmp sub-directory contains two Python scripts for converting files back-and-forth between the AMBER MD code and LAMMPS. See the README file in amber2lmp for more information.

These tools were written by Keir Novik while he was at Queen Mary University of London. Keir is no longer there and cannot support these tools which are out-of-date with respect to the current LAMMPS version (and maybe with respect to AMBER as well). Since we don’t use these tools at Sandia, you will need to experiment with them and make necessary modifications yourself.

10.4.2 binary2txt tool

The file binary2txt.cpp converts one or more binary LAMMPS dump file into ASCII text files. The syntax for running the tool is

```
binary2txt file1 file2 ...
```

which creates file1.txt, file2.txt, etc. This tool must be compiled on a platform that can read the binary file created by a LAMMPS run, since binary files are not compatible across all platforms.

10.4.3 ch2lmp tool

The ch2lmp sub-directory contains tools for converting files back-and-forth between the CHARMM MD code and LAMMPS.

They are intended to make it easy to use CHARMM as a builder and as a post-processor for LAMMPS. Using charmm2lammps.pl, you can convert a PDB file with associated CHARMM info, including CHARMM force field data, into its LAMMPS equivalent. Support for the CMAP correction of CHARMM22 and later is available as an option. This tool can also add solvent water molecules and Na+ or Cl- ions to the system. Using lammps2pdb.pl you can convert LAMMPS atom dumps into PDB files.

See the README file in the ch2lmp sub-directory for more information.

These tools were created by Pieter in’t Veld (pjintve at sandia.gov) and Paul Crozier (pscrozi at sandia.gov) at Sandia. CMAP support added and tested by Xiaohu Hu (hux2 at ornl.gov) and Robert A. Latour (latourr at clemson.edu), David Hyde-Volpe, and Tigran Abramyan, (Clemson University) and Chris Lorenz (chris.lorenz at kcl.ac.uk), King’s College London.
10.4.4 chain tool

The file chain.f creates a LAMMPS data file containing bead-spring polymer chains and/or monomer solvent atoms. It uses a text file containing chain definition parameters as an input. The created chains and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a “soft” pair potential to un-overlap it. The syntax for running the tool is

```
chain < def.chain > data.file
```

See the def.chain or def.chain.ab files in the tools directory for examples of definition files. This tool was used to create the system for the chain benchmark.

10.4.5 CMake tools

The `cmbuild` script is a wrapper around using `cmake --build <dir> --target` and allows compiling LAMMPS in a CMake build folder with a make-like syntax regardless of the actual build tool and the specific name of the program used (e.g. `ninja-v1.10` or `gmake`) when using `-D CMAKE_MAKE_PROGRAM=<name>`.

Usage: `cmbuild [-v] [-h] [-C <dir>] [-j <num>] [<target>]`

Options:
- `-h` print this message
- `-j <NUM>` allow processing of NUM concurrent tasks
- `-C DIRECTORY` execute build in folder DIRECTORY
- `-v` produce verbose output

10.4.6 colvars tools

The colvars directory contains a collection of tools for post-processing data produced by the colvars collective variable library. To compile the tools, edit the makefile for your system and run “make”.

Please report problems and issues the colvars library and its tools at: https://github.com/colvars/colvars/issues

```
abf_integrate:
```

MC-based integration of multidimensional free energy gradient Version 20110511

```
./abf_integrate < filename > [-n < nsteps >] [-t < temp >] [-m [0|1],]
→(metadynamics)] [-h < hill_height >] [-f < variable_hill_factor >]
```

The LAMMPS interface to the colvars collective variable library, as well as these tools, were created by Axel Kohlmeyer (akohlmey at gmail.com) while at ICTP, Italy.
10.4.7 createatoms tool

The tools/createatoms directory contains a Fortran program called createAtoms.f which can generate a variety of interesting crystal structures and geometries and output the resulting list of atom coordinates in LAMMPS or other formats.

See the included Manual.pdf for details.

The tool is authored by Xiaowang Zhou (Sandia), xzhou at sandia.gov.

10.4.8 drude tool

The tools/drude directory contains a Python script called polarizer.py which can add Drude oscillators to a LAMMPS data file in the required format.

See the header of the polarizer.py file for details.

The tool is authored by Agilio Padua and Alain Dequidt: agilio.padua at univ-bpclermont.fr, alain.dequidt at univ-bpclermont.fr

10.4.9 eam database tool

The tools/eam_database directory contains a Fortran program that will generate EAM alloy setfl potential files for any combination of 16 elements: Cu, Ag, Au, Ni, Pd, Pt, Al, Pb, Fe, Mo, Ta, W, Mg, Co, Ti, Zr. The files can then be used with the pair_style eam/alloy command.

The tool is authored by Xiaowang Zhou (Sandia), xzhou at sandia.gov, and is based on his paper:

10.4.10 eam generate tool

The tools/eam_generate directory contains several one-file C programs that convert an analytic formula into a tabulated embedded atom method (EAM) setfl potential file. The potentials they produce are in the potentials directory, and can be used with the pair_style eam/alloy command.

The source files and potentials were provided by Gerolf Ziegenhain (gerolf at ziegenhain.com).

10.4.11 eff tool

The tools/eff directory contains various scripts for generating structures and post-processing output for simulations using the electron force field (eFF).

These tools were provided by Andres Jaramillo-Botero at CalTech (ajaramil at wag.caltech.edu).
10.4.12 emacs tool

The tools/emacs directory contains an Emacs Lisp add-on file for GNU Emacs that enables a lammps-mode for editing input scripts when using GNU Emacs, with various highlighting options set up.

These tools were provided by Aidan Thompson at Sandia (athomps at sandia.gov).

10.4.13 fep tool

The tools/fep directory contains Python scripts useful for post-processing results from performing free-energy perturbation simulations using the USER-FEP package.

The scripts were contributed by Agilio Padua (Universite Blaise Pascal Clermont-Ferrand), agilio.padua at univ-bpclermont.fr.

See README file in the tools/fep directory.

10.4.14 i-pi tool

The tools/i-pi directory contains a version of the i-PI package, with all the LAMMPS-unrelated files removed. It is provided so that it can be used with the fix ipi command to perform path-integral molecular dynamics (PIMD).

The i-PI package was created and is maintained by Michele Ceriotti, michele.ceriotti at gmail.com, to interface to a variety of molecular dynamics codes.

See the tools/i-pi/manual.pdf file for an overview of i-PI, and the fix ipi doc page for further details on running PIMD calculations with LAMMPS.

10.4.15 ipp tool

The tools/ipp directory contains a Perl script ipp which can be used to facilitate the creation of a complicated file (say, a lammps input script or tools/createatoms input file) using a template file.

ipp was created and is maintained by Reese Jones (Sandia), rjones at sandia.gov.

See two examples in the tools/ipp directory. One of them is for the tools/createatoms tool’s input file.

10.4.16 kate tool

The file in the tools/kate directory is an add-on to the Kate editor in the KDE suite that allow syntax highlighting of LAMMPS input scripts. See the README.txt file for details.

The file was provided by Alessandro Luigi Sellerio (alessandro.sellerio at ieni.cnr.it).
10.4.17 lmp2arc tool

The lmp2arc sub-directory contains a tool for converting LAMMPS output files to the format for Accelrys’ Insight MD code (formerly MSI/Biosym and its Discover MD code). See the README file for more information.

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). John is now at the Mayo Clinic (jec at mayo.edu), but still fields questions about the tool.

This tool was updated for the current LAMMPS C++ version by Jeff Greathouse at Sandia (jagreat at sandia.gov).

10.4.18 lmp2cfg tool

The lmp2cfg sub-directory contains a tool for converting LAMMPS output files into a series of *.cfg files which can be read into the AtomEye visualizer. See the README file for more information.

This tool was written by Ara Kooser at Sandia (askoose at sandia.gov).

10.4.19 matlab tool

The matlab sub-directory contains several MATLAB scripts for post-processing LAMMPS output. The scripts include readers for log and dump files, a reader for EAM potential files, and a converter that reads LAMMPS dump files and produces CFG files that can be visualized with the AtomEye visualizer.

See the README.pdf file for more information.

These scripts were written by Arun Subramaniyan at Purdue Univ (asubrama at purdue.edu).

10.4.20 micelle2d tool

The file micelle2d.f creates a LAMMPS data file containing short lipid chains in a monomer solution. It uses a text file containing lipid definition parameters as an input. The created molecules and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a “soft” pair potential to un-overlap it. The syntax for running the tool is

```
micelle2d < def.micelle2d > data.file
```

See the def.micelle2d file in the tools directory for an example of a definition file. This tool was used to create the system for the micelle example.
10.4.21 moltemplate tool

The moltemplate sub-directory contains instructions for installing moltemplate, a Python-based tool for building molecular systems based on a text-file description, and creating LAMMPS data files that encode their molecular topology as lists of bonds, angles, dihedrals, etc. See the README.txt file for more information.

This tool was written by Andrew Jewett (jewett.aij at gmail.com), who supports it. It has its own WWW page at https://moltemplate.org. The latest sources can be found on its GitHub page.

10.4.22 msi2lmp tool

The msi2lmp sub-directory contains a tool for creating LAMMPS template input and data files from BIOVIA's Materials Studio files (formerly Accelrys' Insight MD code, formerly MSI/Biosym and its Discover MD code).

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). Several people contributed changes to remove bugs and adapt its output to changes in LAMMPS.

This tool has several known limitations and is no longer under active development, so there are no changes except for the occasional bug fix.

See the README file in the tools/msi2lmp folder for more information.

10.4.23 phonon tool

The phonon sub-directory contains a post-processing tool useful for analyzing the output of the fix phonon command in the USER-PHONON package.

See the README file for instruction on building the tool and what library it needs. And see the examples/USER/phonon directory for example problems that can be post-processed with this tool.

This tool was written by Ling-Ti Kong at Shanghai Jiao Tong University.

10.4.24 polybond tool

The polybond sub-directory contains a Python-based tool useful for performing “programmable polymer bonding”. The Python file lmpsdata.py provides a “Lmpsdata” class with various methods which can be invoked by a user-written Python script to create data files with complex bonding topologies.

See the Manual.pdf for details and example scripts.

This tool was written by Zachary Kraus at Georgia Tech.
10.4.25 pymol_asphere tool

The pymol_asphere sub-directory contains a tool for converting a LAMMPS dump file that contains orientation info for ellipsoidal particles into an input file for the PyMol visualization package or its open source variant.

Specifically, the tool triangulates the ellipsoids so they can be viewed as true ellipsoidal particles within PyMol. See the README and examples directory within pymol_asphere for more information.

This tool was written by Mike Brown at Sandia.

10.4.26 python tool

The python sub-directory contains several Python scripts that perform common LAMMPS post-processing tasks, such as:

- extract thermodynamic info from a log file as columns of numbers
- plot two columns of thermodynamic info from a log file using GnuPlot
- sort the snapshots in a dump file by atom ID
- convert multiple NEB dump files into one dump file for viz
- convert dump files into XYZ, CFG, or PDB format for viz by other packages

These are simple scripts built on Pizza.py modules. See the README for more info on Pizza.py and how to use these scripts.

10.4.27 replica tool

The tools/replica directory contains the reorder_remd_traj python script which can be used to reorder the replica trajectories (resulting from the use of the temper command) according to temperature. This will produce discontinuous trajectories with all frames at the same temperature in each trajectory. Additional options can be used to calculate the canonical configurational log-weight for each frame at each temperature using the pymbar package. See the README.md file for further details. Try out the peptide example provided.

This tool was written by (and is maintained by) Tanmoy Sanyal, while at the Shell lab at UC Santa Barbara. (tanmoy dot 7989 at gmail.com)

10.4.28 reax tool

The reax sub-directory contains stand-alone codes that can post-process the output of the fix reax/c/bonds command from a LAMMPS simulation using ReaxFF. See the README.txt file for more info.

These tools were written by Aidan Thompson at Sandia.
10.4.29 smd tool

The smd sub-directory contains a C++ file dump2vtk_tris.cpp and Makefile which can be compiled and used to convert triangle output files created by the Smooth-Mach Dynamics (USER-SMD) package into a VTK-compatible unstructured grid file. It could then be read in and visualized by VTK.

See the header of dump2vtk.cpp for more details.

This tool was written by the USER-SMD package author, Georg Ganzenmuller at the Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute in Germany (georg.ganzenmueller at emi.fhg.de).

10.4.30 spin tool

The spin sub-directory contains a C file interpolate.c which can be compiled and used to perform a cubic polynomial interpolation of the MEP following a GNEB calculation.

See the README file in tools/spin/interpolate_gneb for more details.

This tool was written by the SPIN package author, Julien Tranchida at Sandia National Labs (jtranch at sandia.gov, and by Aleksei Ivanov, at University of Iceland (ali5 at hi.is).

10.4.31 singularity tool

The singularity sub-directory contains container definitions files that can be used to build container images for building and testing LAMMPS on specific OS variants using the Singularity container software. Contributions for additional variants are welcome.

10.4.32 vim tool

The files in the tools/vim directory are add-ons to the VIM editor that allow easier editing of LAMMPS input scripts. See the README.txt file for details.

These files were provided by Gerolf Ziegenhain (gerolf at ziegenhain.com)

10.4.33 xmgrace tool

The files in the tools/xmgrace directory can be used to plot the thermodynamic data in LAMMPS log files via the xmgrace plotting package. There are several tools in the directory that can be used in post-processing mode. The lammpsplot.cpp file can be compiled and used to create plots from the current state of a running LAMMPS simulation.

See the README file for details.

These files were provided by Vikas Varshney (vv0210 at gmail.com)
11.1 Overview of Python and LAMMPS

LAMMPS can work together with Python in three ways. First, Python can wrap LAMMPS through its library interface, so that a Python script can create one or more instances of LAMMPS and launch one or more simulations. In Python lingo, this is called “extending” Python with a LAMMPS module.

Second, a lower-level Python interface can be used indirectly through the provided PyLammps and IPyLammps wrapper classes, written in Python. These wrappers try to simplify the usage of LAMMPS in Python by providing an object-based interface to common LAMMPS functionality. They also reduces the amount of code necessary to parameterize LAMMPS scripts through Python and make variables and computes directly accessible.

Third, LAMMPS can use the Python interpreter, so that a LAMMPS input script or styles can invoke Python code directly, and pass information back-and-forth between the input script and Python functions you write. This Python code can also callback to LAMMPS to query or change its attributes through the LAMMPS Python module mentioned above. In Python lingo, this is “embedding” Python in LAMMPS. When used in this mode, Python can perform script operations that the simple LAMMPS input script syntax can not.

11.2 Run LAMMPS from Python

The LAMMPS distribution includes a python directory with all you need to run LAMMPS from Python. The python/lammps.py file wraps the LAMMPS library interface, with one wrapper function per LAMMPS library function. This file makes it is possible to do the following either from a Python script, or interactively from a Python prompt: create one or more instances of LAMMPS, invoke LAMMPS commands or give it an input script, run LAMMPS incrementally, extract LAMMPS results, and modify internal LAMMPS variables. From a Python script you can do this in serial or parallel. Running Python interactively in parallel does not generally work, unless you have a version of Python that extends Python to enable multiple instances of Python to read what you type.

To do all of this, you must first build LAMMPS as a shared library, then insure that your Python can find the python/lammps.py file and the shared library.

Two advantages of using Python to run LAMMPS are how concise the language is, and that it can be run interactively, enabling rapid development and debugging. If you use it to mostly invoke costly operations within LAMMPS, such as running a simulation for a reasonable number of timesteps, then the overhead cost of invoking LAMMPS through Python will be negligible.

The Python wrapper for LAMMPS uses the “ctypes” package in Python, which auto-generates the interface code needed between Python and a set of C-style library functions. Ctypes is part of standard Python for versions 2.5 and later. You can check which version of Python you have by simply typing “python” at a shell prompt.
11.3 Build LAMMPS as a shared library

11.3.1 Build LAMMPS as a shared library using make

Instructions on how to build LAMMPS as a shared library are given on the Build_basics doc page. A shared library is one that is dynamically loadable, which is what Python requires to wrap LAMMPS. On Linux this is a library file that ends in "so", not "a".

From the src directory, type

```
make foo mode=shared
```

where foo is the machine target name, such as mpi or serial. This should create the file liblammps_foo.so in the src directory, as well as a soft link liblammps.so, which is what the Python wrapper will load by default. Note that if you are building multiple machine versions of the shared library, the soft link is always set to the most recently built version.

**Note:** If you are building LAMMPS with an MPI or FFT library or other auxiliary libraries (used by various packages), then all of these extra libraries must also be shared libraries. If the LAMMPS shared-library build fails with an error complaining about this, see the Build_basics doc page.

11.3.2 Build LAMMPS as a shared library using CMake

When using CMake the following two options are necessary to generate the LAMMPS shared library:

```
-D BUILD_SHARED_LIBS=on
-D CMAKE_INSTALL_PREFIX=$VIRTUAL_ENV
```

What this does is create a liblammps.so which contains the majority of LAMMPS code. The generated lmp binary also dynamically links to this library. This means that either this liblammps.so file has to be in the same directory, a system library path (e.g. /usr/lib64/) or in the LD_LIBRARY_PATH.

If you want to use the shared library with Python the recommended way is to create a virtualenv and use it as CMAKE_INSTALL_PREFIX.

```
# create virtualenv
virtualenv --python=$(which python3) myenv3
source myenv3/bin/activate

# build library
mkdir build
cd build
cmake -D PKG_PYTHON=on -D BUILD_SHARED_LIBS=on -D CMAKE_INSTALL_PREFIX=$VIRTUAL_ENV ..
cmake -j 4

# install into prefix
make install
```

This will also install the Python module into your virtualenv. Since virtualenv does not change your LD_LIBRARY_PATH, you still need to add its lib64 folder to it, which contains the installed liblammps.so.

```
export LD_LIBRARY_PATH=$VIRTUAL_ENV/lib64:$LD_LIBRARY_PATH
```
Starting Python outside (!) of your build directory, but with the virtualenv enabled and with the LD_LIBRARY_PATH set gives you access to LAMMPS via Python.

11.4 Installing LAMMPS in Python

For Python to invoke LAMMPS, there are 2 files it needs to know about:

- python/lammps.py
- liblammps.so or liblammps.dylib

The python source code in lammps.py is the Python wrapper on the LAMMPS library interface. The liblammps.so or liblammps.dylib file is the shared LAMMPS library that Python loads dynamically.

You can achieve that Python can find these files in one of two ways:

- set two environment variables pointing to the location in the source tree
- run “make install-python” or run the python/install.py script explicitly

When calling “make install-python” LAMMPS will try to install the python module and the shared library into the python site-packages folders; either the system-wide ones, or the local users ones (in case of insufficient permissions for the global install). Python will then find the module and shared library file automatically. The exact location of these folders depends on your python version and your operating system. When using the CMake build system, you can set the python executable to use during the CMake configuration process. Details are given in the build instructions for the PYTHON package. When using the conventional make system, you can override the python version to version x.y when calling make with PYTHON=pythonx.y.

If you set the paths to these files as environment variables, you only have to do it once. For the csh or tcsh shells, add something like this to your ~/.cshrc file, one line for each of the two files:

```bash
setenv PYTHONPATH ${{PYTHONPATH}}:/home/sjplimp/lammps/python
setenv LD_LIBRARY_PATH ${{LD_LIBRARY_PATH}}:/home/sjplimp/lammps/src
```

On MacOSX you may also need to set DYLD_LIBRARY_PATH accordingly. For Bourne/Korn shells accordingly into the corresponding files using the “export” shell builtin.

If you use “make install-python” or the python/install.py script, you need to invoke it every time you rebuild LAMMPS (as a shared library) or make changes to the python/lammps.py file, so that the site-packages files are updated with the new version.

If the default settings of “make install-python” are not what you want, you can invoke install.py from the python directory manually as

```bash
% python install.py -m <python module> -l <shared library> -v <version.h file> → [-d <pydir>]
```

- The -m flag points to the lammps.py python module file to be installed,
- the -l flag points to the LAMMPS shared library file to be installed,
- the -v flag points to the version.h file in the LAMMPS source
- and the optional -d flag to a custom (legacy) installation folder

If you use a legacy installation folder, you will need to set your PYTHONPATH and LD_LIBRARY_PATH (and/or DYLD_LIBRARY_PATH) environment variables accordingly, as described above.

Note that if you want Python to be able to load different versions of the LAMMPS shared library (see this section), you will need to manually copy files like liblammps_g++.so into the appropriate system directory. This is not needed if you set the LD_LIBRARY_PATH environment variable as described above.

11.4. Installing LAMMPS in Python 297
11.5 Extending Python to run in parallel

If you wish to run LAMMPS in parallel from Python, you need to extend your Python with an interface to MPI. This also allows you to make MPI calls directly from Python in your script, if you desire.

We have tested this with mpi4py and pypar:

- MPI for Python
- pypar

We recommend the use of mpi4py as it is the more complete MPI interface, and as of version 2.0.0 mpi4py allows passing a custom MPI communicator to the LAMMPS constructor, which means one can easily run one or more LAMMPS instances on subsets of the total MPI ranks.

To install mpi4py (version mpi4py-3.0.3 as of Nov 2019), unpack it and from its main directory, type

```python
python setup.py build
sudo python setup.py install
```

Again, the “sudo” is only needed if required to copy mpi4py files into your Python distribution’s site-packages directory. To install with user privilege into the user local directory type

```bash
python setup.py install --user
```

If you have successfully installed mpi4py, you should be able to run Python and type

```python
from mpi4py import MPI
```

without error. You should also be able to run python in parallel on a simple test script

```bash
% mpirun -np 4 python test.py
```

where test.py contains the lines

```python
from mpi4py import MPI
comm = MPI.COMM_WORLD
print "Proc %d out of %d procs" % (comm.Get_rank(), comm.Get_size())
```

and see one line of output for each processor you run on.

**Note:** To use mpi4py and LAMMPS in parallel from Python, you must insure both are using the same version of MPI. If you only have one MPI installed on your system, this is not an issue, but it can be if you have multiple MPIs. Your LAMMPS build is explicit about which MPI it is using, since you specify the details in your low-level src/MAKE/Makefile.foo file. Mpi4py uses the “mpicc” command to find information about the MPI it uses to build against. And it tries to load “libmpi.so” from the LD_LIBRARY_PATH. This may or may not find the MPI library that LAMMPS is using. If you have problems running both mpi4py and LAMMPS together, this is an issue you may need to address, e.g. by moving other MPI installations so that mpi4py finds the right one.
11.6 Test the Python/LAMMPS interface

To test if LAMMPS is callable from Python, launch Python interactively and type:

```
>>> from lammps import lammps
>>> lmp = lammps()
```

If you get no errors, you’re ready to use LAMMPS from Python. If the second command fails, the most common error to see is

```
OSError: Could not load LAMMPS dynamic library
```

which means Python was unable to load the LAMMPS shared library. This typically occurs if the system can’t find the LAMMPS shared library or one of the auxiliary shared libraries it depends on, or if something about the library is incompatible with your Python. The error message should give you an indication of what went wrong.

You can also test the load directly in Python as follows, without first importing from the lammps.py file:

```
>>> from ctypes import CDLL
>>> CDLL("liblammps.so")
```

If an error occurs, carefully go through the steps on the Build basics doc page about building a shared library and the Python_install doc page about insuring Python can find the necessary two files it needs.

11.6.1 Test LAMMPS and Python in serial:

To run a LAMMPS test in serial, type these lines into Python interactively from the bench directory:

```
>>> from lammps import lammps
>>> lmp = lammps()
>>> lmp.file("in.lj")
```

Or put the same lines in the file test.py and run it as

```
% python test.py
```

Either way, you should see the results of running the in.lj benchmark on a single processor appear on the screen, the same as if you had typed something like:

```
lmp_g++ -in in.lj
```

11.6.2 Test LAMMPS and Python in parallel:

To run LAMMPS in parallel, assuming you have installed the PyPar package as discussed above, create a test.py file containing these lines:

```
import pypar
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
print "Proc %d out of %d procs has" % (pypar.rank(),pypar.size()),lmp
pypar.finalize()
```

11.6. Test the Python/LAMMPS interface 299
To run LAMMPS in parallel, assuming you have installed the `mpi4py` package as discussed above, create a `test.py` file containing these lines:

```python
from mpi4py import MPI
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
me = MPI.COMM_WORLD.Get_rank()
nprocs = MPI.COMM_WORLD.Get_size()
print "Proc %d out of %d procs has" % (me,nprocs),lmp
MPI.Finalize()
```

You can either script in parallel as:

```bash
% mpirun -np 4 python test.py
```

and you should see the same output as if you had typed

```bash
% mpirun -np 4 lmp_g++ -in in.lj
```

Note that if you leave out the 3 lines from `test.py` that specify PyPar commands you will instantiate and run LAMMPS independently on each of the P processors specified in the mpirun command. In this case you should get 4 sets of output, each showing that a LAMMPS run was made on a single processor, instead of one set of output showing that LAMMPS ran on 4 processors. If the 1-processor outputs occur, it means that PyPar is not working correctly.

Also note that once you import the PyPar module, PyPar initializes MPI for you, and you can use MPI calls directly in your Python script, as described in the PyPar documentation. The last line of your Python script should be `pypar.finalize()`, to insure MPI is shut down correctly.

### 11.6.3 Running Python scripts:

Note that any Python script (not just for LAMMPS) can be invoked in one of several ways:

```bash
% python foo.script
% python -i foo.script
% foo.script
```

The last command requires that the first line of the script be something like this:

```bash
#!/usr/local/bin/python
#!/usr/local/bin/python -i
```

where the path points to where you have Python installed, and that you have made the script file executable:

```bash
% chmod +x foo.script
```

Without the “-i” flag, Python will exit when the script finishes. With the “-i” flag, you will be left in the Python interpreter when the script finishes, so you can type subsequent commands. As mentioned above, you can only run Python interactively when running Python on a single processor, not in parallel.
11.7 Python library interface

As described previously, the Python interface to LAMMPS consists of a Python “lammps” module, the source code for which is in python/lammps.py, which creates a “lammps” object, with a set of methods that can be invoked on that object. The sample Python code below assumes you have first imported the “lammps” module in your Python script, as follows:

```
from lammps import lammps
```

These are the methods defined by the lammps module. If you look at the files src/library.cpp and src/library.h you will see they correspond one-to-one with calls you can make to the LAMMPS library from a C++ or C or Fortran program, and which are described on the Howto library doc page.

The python/examples directory has Python scripts which show how Python can run LAMMPS, grab data, change it, and put it back into LAMMPS.

```
lmp = lammps()  # create a LAMMPS object using the default liblammps.so
lmp = lammps(ptr=lmpptr)  # 4 optional args are allowed: name, cmdargs, ptr, comm
lmp = lammps(comm=split)  # create a LAMMPS object with a custom communicator,
                         # requires mpi4py 2.0.0 or later
lmp = lammps(name="g++")  # create a LAMMPS object using the liblammps_g++.so library
lmp = lammps(name="g++",cmdargs=list)  # add LAMMPS command-line args, e.g. list = ["-echo","screen"]
lmp.close()  # destroy a LAMMPS object

version = lmp.version()  # return the numerical version id, e.g. LAMMPS 2 Sep 2015 \rightarrow 20150902

lmp.file(file)  # run an entire input script, file = "in.lj"
lmp.command(cmd)  # invoke a single LAMMPS command, cmd = "run 100"
lmp.commands_list(cmdlist)  # invoke commands in cmdlist = **"run 10", "run 20"**
lmp.commands_string(multicmd)  # invoke commands in multicmd = "run 10\nrun 20"

size = lmp.extract_setting(name)  # return data type info
xlo = lmp.extract_global(name,type)  # extract a global quantity
    # name = "boxxlo", "nlocal", etc
    # type = 0 = int
    # 1 = double

boxlo,boxhi,xy,yz,xz,periodicity,box_change = lmp.extract_box()  # extract box info

coords = lmp.extract_atom(name,type)  # extract a per-atom quantity
    # name = "x", "type", etc
    # type = 0 = vector of ints
    # 1 = array of ints
    # 2 = vector of doubles
    # 3 = array of doubles

eng = lmp.extract_compute(id,style,type)  # extract value(s) from a compute
v3 = lmp.extract_fix(id,style,type,i,j)  # extract value(s) from a fix

(continues on next page)
The lines

```python
from lammps import lmp
lmp = lmp()
```

create an instance of LAMMPS, wrapped in a Python class by the lammps Python module, and return an instance of the Python class as lmp. It is used to make all subsequent calls to the LAMMPS library.

Additional arguments to lmp() can be used to tell Python the name of the shared library to load or to pass arguments to the LAMMPS instance, the same as if LAMMPS were launched from a command-line prompt.

If the ptr argument is set like this:

```python
lmp = lmp(ptr=lmpptr)
```

then lmpptr must be an argument passed to Python via the LAMMPS `python` command, when it is used to define a Python function that is invoked by the LAMMPS input script. This mode of calling Python from LAMMPS is
described in the *Python call* doc page. The variable lmpptr refers to the instance of LAMMPS that called the embedded Python interpreter. Using it as an argument to lammps() allows the returned Python class instance “lmp” to make calls to that instance of LAMMPS. See the *python* command doc page for examples using this syntax.

Note that you can create multiple LAMMPS objects in your Python script, and coordinate and run multiple simulations, e.g.

```python
from lammps import lammps
lmp1 = lammps()
lmp2 = lammps()
lmp1.file("in.file1")
lmp2.file("in.file2")
```

The file(), command(), commands_list(), commands_string() methods allow an input script, a single command, or multiple commands to be invoked.

The extract_setting(), extract_global(), extract_box(), extract_atom(), extract_compute(), extract_fix(), and extract_variable() methods return values or pointers to data structures internal to LAMMPS.

For extract_global() see the src/library.cpp file for the list of valid names. New names could easily be added. A double or integer is returned. You need to specify the appropriate data type via the type argument.

For extract_atom(), a pointer to internal LAMMPS atom-based data is returned, which you can use via normal Python subscripting. See the extract() method in the src/atom.cpp file for a list of valid names. Again, new names could easily be added if the property you want is not listed. A pointer to a vector of doubles or integers, or a pointer to an array of doubles (double **) or integers (int **) is returned. You need to specify the appropriate data type via the type argument.

For extract_compute() and extract_fix(), the global, per-atom, or local data calculated by the compute or fix can be accessed. What is returned depends on whether the compute or fix calculates a scalar or vector or array. For a scalar, a single double value is returned. If the compute or fix calculates a vector or array, a pointer to the internal LAMMPS data is returned, which you can use via normal Python subscripting. The one exception is that for a fix that calculates a global vector or array, a single double value from the vector or array is returned, indexed by I (vector) or I and J (array). I,J are zero-based indices. The I,J arguments can be left out if not needed. See the *Howto output* doc page for a discussion of global, per-atom, and local data, and of scalar, vector, and array data types. See the doc pages for individual *computes* and *fixes* for a description of what they calculate and store.

For extract_variable(), an *equal-style* or *atom-style variable* is evaluated and its result returned.

For equal-style variables a single double value is returned and the group argument is ignored. For atom-style variables, a vector of doubles is returned, one value per atom, which you can use via normal Python subscripting. The values will be zero for atoms not in the specified group.

The get_thermo() method returns the current value of a thermo keyword as a float.

The get_natoms() method returns the total number of atoms in the simulation, as an int.

The set_variable() method sets an existing string-style variable to a new string value, so that subsequent LAMMPS commands can access the variable.

The reset_box() method resets the size and shape of the simulation box, e.g. as part of restoring a previously extracted and saved state of a simulation.

The gather methods collect peratom info of the requested type (atom coords, atom types, forces, etc) from all processors, and returns the same vector of values to each calling processor. The scatter functions do the inverse. They distribute a vector of peratom values, passed by all calling processors, to individual atoms, which may be owned by different processors.

Note that the data returned by the gather methods, e.g. gather_atoms("x"), is different from the data structure returned by extract_atom("x") in four ways. (1) Gather_atoms() returns a vector which you index as x[i]; extract_atom() returns an array which you index as x[i][j]. (2) Gather_atoms() orders the atoms by atom ID while extract_atom() does not.
(3) `Gather_atoms()` returns a list of all atoms in the simulation; `extract_atoms()` returns just the atoms local to each processor. (4) Finally, the `gather_atoms()` data structure is a copy of the atom coords stored internally in LAMMPS, whereas `extract_atom()` returns an array that effectively points directly to the internal data. This means you can change values inside LAMMPS from Python by assigning a new values to the `extract_atom()` array. To do this with the `gather_atoms()` vector, you need to change values in the vector, then invoke the `scatter_atoms()` method.

For the scatter methods, the array of coordinates passed to must be a ctypes vector of ints or doubles, allocated and initialized something like this:

```python
from ctypes import *

n3 = 3
x = (n3*c_double)()
x[0] = x coord of atom with ID 1
x[1] = y coord of atom with ID 1
x[2] = z coord of atom with ID 1
x[3] = x coord of atom with ID 2
...
x[n3-1] = z coord of atom with ID natoms

lmp.scatter_atoms("x",1,3,x)
```

Alternatively, you can just change values in the vector returned by the gather methods, since they are also ctypes vectors.

As noted above, these Python class methods correspond one-to-one with the functions in the LAMMPS library interface in `src/library.cpp` and `library.h`. This means you can extend the Python wrapper via the following steps:

- Add a new interface function to `src/library.cpp` and `src/library.h`.
- Rebuild LAMMPS as a shared library.
- Add a wrapper method to `python/lammps.py` for this interface function.
- You should now be able to invoke the new interface function from a Python script.

### 11.8 PyLammps interface

PyLammps is a Python wrapper class which can be created on its own or use an existing lammps Python object. It has its own [Howto pylammps doc page](#).

### 11.9 Example Python scripts that use LAMMPS

These are the Python scripts included as demos in the `python/examples` directory of the LAMMPS distribution, to illustrate the kinds of things that are possible when Python wraps LAMMPS. If you create your own scripts, send them to us and we can include them in the LAMMPS distribution.
<table>
<thead>
<tr>
<th>Script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trivial.py</td>
<td>read/run a LAMMPS input script through Python</td>
</tr>
<tr>
<td>demo.py</td>
<td>invoke various LAMMPS library interface routines</td>
</tr>
<tr>
<td>simple.py</td>
<td>run in parallel</td>
</tr>
<tr>
<td>similar to examples/COUPLE/simple/simple.cpp</td>
<td>split.py</td>
</tr>
<tr>
<td>same as simple.py but running in parallel on a subset of procs</td>
<td>gui.py</td>
</tr>
<tr>
<td>GUI go/stop/temperature-slider to control LAMMPS</td>
<td>plot.py</td>
</tr>
<tr>
<td>real-time temperature plot with GnuPlot via Pizza.py</td>

<tr>
<td>real-time viz via some viz package</td>
<td>vizplotgui_tool.py</td>
</tr>
<tr>
<td>combination of viz_tool.py and plot.py and gui.py</td>
<td></td>
</tr>
</tbody>
</table>

For the viz_tool.py and vizplotgui_tool.py commands, replace “tool” with “gl” or “atomeye” or “pymol” or “vmd”, depending on what visualization package you have installed.

Note that for GL, you need to be able to run the Pizza.py GL tool, which is included in the pizza sub-directory. See the Pizza.py doc pages for more info:

Note that for AtomEye, you need version 3, and there is a line in the scripts that specifies the path and name of the executable. See the AtomEye WWW pages here or here for more details:

http://li.mit.edu/Archive/Graphics/A/

The latter link is to AtomEye 3 which has the scripting capability needed by these Python scripts.

Note that for PyMol, you need to have built and installed the open-source version of PyMol in your Python, so that you can import it from a Python script. See the PyMol WWW pages here or here for more details:

https://www.pymol.org
https://github.com/schrodinger/pymol-open-source

The latter link is to the open-source version.

Note that for VMD, you need a fairly current version (1.8.7 works for me) and there are some lines in the pizza/vmd.py script for 4 PIZZA variables that have to match the VMD installation on your system.

See the python/README file for instructions on how to run them and the source code for individual scripts for comments about what they do.

Here are screenshots of the vizplotgui_tool.py script in action for different visualization package options:
11.10 Call Python from a LAMMPS input script

LAMMPS has several commands which can be used to invoke Python code directly from an input script:

- `python`
- `variable python`
- `fix python/invoke`
- `pair_style python`

The `python` command can be used to define and execute a Python function that you write the code for. The Python function can also be assigned to a LAMMPS python-style variable via the `variable` command. Each time the variable is evaluated, either in the LAMMPS input script itself, or by another LAMMPS command that uses the variable, this will trigger the Python function to be invoked.

The Python code for the function can be included directly in the input script or in an auxiliary file. The function can have arguments which are mapped to LAMMPS variables (also defined in the input script) and it can return a value to a LAMMPS variable. This is thus a mechanism for your input script to pass information to a piece of Python code, ask Python to execute the code, and return information to your input script.

Note that a Python function can be arbitrarily complex. It can import other Python modules, instantiate Python classes, call other Python functions, etc. The Python code that you provide can contain more code than the single function. It can contain other functions or Python classes, as well as global variables or other mechanisms for storing state between calls from LAMMPS to the function.

The Python function you provide can consist of “pure” Python code that only performs operations provided by standard Python. However, the Python function can also “call back” to LAMMPS through its Python-wrapped library interface, in the manner described in the *Python run* doc page. This means it can issue LAMMPS input script commands or query and set internal LAMMPS state. As an example, this can be useful in an input script to create a more complex loop with branching logic, than can be created using the simple looping and branching logic enabled by the `next` and `if` commands.

See the `python` doc page and the `variable` doc page for its python-style variables for more info, including examples of Python code you can write for both pure Python operations and callbacks to LAMMPS.

The `fix python/invoke` command can execute Python code at selected timesteps during a simulation run.

The `pair_style python` command allows you to define pairwise potentials as python code which encodes a single pairwise interaction. This is useful for rapid development and debugging of a new potential.

To use any of these commands, you only need to build LAMMPS with the PYTHON package installed:

```
make yes-python
make machine
```

Note that this will link LAMMPS with the Python library on your system, which typically requires several auxiliary system libraries to also be linked. The list of these libraries and the paths to find them are specified in the lib/python/Makelfile.lammps file. You need to insure that file contains the correct information for your version of Python and your machine to successfully build LAMMPS. See the lib/python/README file for more info.

If you want to write Python code with callbacks to LAMMPS, then you must also follow the steps summarized in the *Python run* doc page. I.e. you must build LAMMPS as a shared library and insure that Python can find the `python/lammps.py` file and the shared library.

If you’re not familiar with Python, it’s a powerful scripting and programming language which can do most everything that lower-level languages like C or C++ can do in fewer lines of code. The only drawback is slower execution speed. Python is also easy to use as a “glue” language to drive a program through its library interface, or to hook multiple pieces of software together, such as a simulation code plus a visualization tool, or to run a coupled multiscale or multiphysics model.
See the Howto_coupl edoc page for more ideas about coupling LAMMPS to other codes. See the Howto library doc page for a description of the LAMMPS library interface provided in src/library.h and src/library.h. That interface is exposed to Python either when calling LAMMPS from Python or when calling Python from a LAMMPS input script and then calling back to LAMMPS from Python code. The library interface is designed to be easy to add functionality to. Thus the Python interface to LAMMPS is also easy to extend as well.

If you create interesting Python scripts that run LAMMPS or interesting Python functions that can be called from a LAMMPS input script, that you think would be generally useful, please post them as a pull request to our GitHub site, and they can be added to the LAMMPS distribution or webpage.
CHAPTER
TWELVE
ERRORS

These doc pages describe the errors you can encounter when using LAMMPS. The common problems include conceptual issues. The messages and warnings doc pages give complete lists of all the messages the code may generate (except those generated by USER packages), with additional details for many of them.

12.1 Common problems

If two LAMMPS runs do not produce the exact same answer on different machines or different numbers of processors, this is typically not a bug. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off can cause slight differences and eventual divergence of molecular dynamics phase space trajectories within a few 100s or few 1000s of timesteps. However, the statistical properties of the two runs (e.g. average energy or temperature) should still be the same.

If the velocity command is used to set initial atom velocities, a particular atom can be assigned a different velocity when the problem is run on a different number of processors or on different machines. If this happens, the phase space trajectories of the two simulations will rapidly diverge. See the discussion of the loop option in the velocity command for details and options that avoid this issue.

Similarly, the create_atoms command generates a lattice of atoms. For the same physical system, the ordering and numbering of atoms by atom ID may be different depending on the number of processors.

Some commands use random number generators which may be setup to produce different random number streams on each processor and hence will produce different effects when run on different numbers of processors. A commonly-used example is the fix langevin command for thermostating.

A LAMMPS simulation typically has two stages, setup and run. Most LAMMPS errors are detected at setup time; others like a bond stretching too far may not occur until the middle of a run.

LAMMPS tries to flag errors and print informative error messages so you can fix the problem. For most errors it will also print the last input script command that it was processing. Of course, LAMMPS cannot figure out your physics or numerical mistakes, like choosing too big a timestep, specifying erroneous force field coefficients, or putting 2 atoms on top of each other! If you run into errors that LAMMPS does not catch that you think it should flag, please send an email to the developers.

If you get an error message about an invalid command in your input script, you can determine what command is causing the problem by looking in the log.lammps file or using the echo command to see it on the screen. If you get an error like “Invalid . . . style”, with . . . being fix, compute, pair, etc, it means that you mistyped the style name or that the command is part of an optional package which was not compiled into your executable. The list of available styles in your executable can be listed by using the -h command-line switch. The installation and compilation of optional packages is explained on the Build packages doc page.

For a given command, LAMMPS expects certain arguments in a specified order. If you mess this up, LAMMPS will often flag the error, but it may also simply read a bogus argument and assign a value that is valid, but not what you wanted. E.g. trying to read the string “abc” as an integer value of 0. Careful reading of the associated doc page for the
command should allow you to fix these problems. In most cases, where LAMMPS expects to read a number, either integer or floating point, it performs a stringent test on whether the provided input actually is an integer or floating-point number, respectively, and reject the input with an error message (for instance, when an integer is required, but a floating-point number 1.0 is provided):

```
ERROR: Expected integer parameter instead of '1.0' in input script or data file
```

Some commands allow for using variable references in place of numeric constants so that the value can be evaluated and may change over the course of a run. This is typically done with the syntax \texttt{v\_name} for a parameter, where name is the name of the variable. On the other hand, immediate variable expansion with the syntax \texttt{$\{\text{name}\}} is performed while reading the input and before parsing commands.

**Note:** Using a variable reference (i.e. \texttt{v\_name}) is only allowed if the documentation of the corresponding command explicitly says it is. Otherwise, you will receive an error message of this kind:

```
ERROR: Expected floating point parameter instead of 'v\_name' in input script or data file
```

Generally, LAMMPS will print a message to the screen and log file and exit gracefully when it encounters a fatal error. Sometimes it will print a WARNING to the screen and log file and continue on; you can decide if the WARNING is important or not. A WARNING message that is generated in the middle of a run is only printed to the screen, not to the log file, to avoid cluttering up thermodynamic output. If LAMMPS crashes or hangs without spitting out an error message first then it could be a bug (see this section) or one of the following cases:

LAMMPS runs in the available memory a processor allows to be allocated. Most reasonable MD runs are compute limited, not memory limited, so this should not be a bottleneck on most platforms. Almost all large memory allocations in the code are done via C-style malloc’s which will generate an error message if you run out of memory. Smaller chunks of memory are allocated via C++ “new” statements. If you are unlucky you could run out of memory just when one of these small requests is made, in which case the code will crash or hang (in parallel), since LAMMPS does not trap on those errors.

Illegal arithmetic can cause LAMMPS to run slow or crash. This is typically due to invalid physics and numerics that your simulation is computing. If you see wild thermodynamic values or NaN values in your LAMMPS output, something is wrong with your simulation. If you suspect this is happening, it is a good idea to print out thermodynamic info frequently (e.g. every timestep) via the \texttt{thermo} so you can monitor what is happening. Visualizing the atom movement is also a good idea to insure your model is behaving as you expect.

In parallel, one way LAMMPS can hang is due to how different MPI implementations handle buffering of messages. If the code hangs without an error message, it may be that you need to specify an MPI setting or two (usually via an environment variable) to enable buffering or boost the sizes of messages that can be buffered.

### 12.2 Reporting bugs

If you are confident that you have found a bug in LAMMPS, please follow the steps outlined below:

- Check the New features and bug fixes section of the LAMMPS WWW site or the GitHub Releases page to see if the bug has already been addressed in a patch release.
- Check that your issue can be reproduced with the latest development version of LAMMPS.
- Check the manual carefully to verify that the unexpected behavior you are observing is indeed in conflict with the documentation.
- Check the GitHub Issue page if your issue has already been reported and if it is still open.
• Check the GitHub Pull Requests page to see if there is already a fix for your bug pending.
• Check the mailing list archives to see if the issue has been discussed before.

If none of these steps yields any useful information, please file a new bug report on the GitHub Issue page. The website will offer you to select a suitable template with explanations and then you should replace those explanations with the information that you can provide to reproduce your issue.

The most useful thing you can do to help us verify and fix a bug is to isolate the problem. Run it on the smallest number of atoms and fewest number of processors with the simplest input script that reproduces the bug. Try to identify what command or combination of commands is causing the problem and upload the complete input deck as a tar or zip archive. Please avoid using binary restart files unless the issue requires it. In the latter case you should also include an input deck to quickly generate this restart from a data file or a simple additional input. This input deck can be used with tools like a debugger or valgrind to further debug the crash.

You may also send an email to the LAMMPS mailing list at “lammps-users at lists.sourceforge.net” describing the problem with the same kind of information. The mailing list can provide a faster response, especially if the bug reported is actually expected behavior. But because of the high volume of the mailing list, it can happen that your e-mail is overlooked and then forgotten. Issues on GitHub have to be explicitly closed, so that will guarantee that at least one LAMMPS developer will have looked at it.

### 12.3 Debugging crashes

If LAMMPS crashes with a “segmentation fault” or a “bus error” or similar message, then you can use the following two methods to further narrow down the origin of the issue. This will help the LAMMPS developers (or yourself) to understand the reason for the crash and apply a fix (either to the input script or the source code). This requires that your LAMMPS executable includes the required debug information. Otherwise it is not possible to look up the names of functions or variables.

The following patch will introduce a bug into the code for pair style `lj/cut` when using the `examples/melt/in.melt` input. We use it to show how to identify the origin of a segmentation fault.

```c
--- a/src/pair_lj_cut.cpp
+++ b/src/pair_lj_cut.cpp
@@ -81,6 +81,7 @@ void PairLJCut::compute(int eflag, int vflag)
      int nlocal = atom->nlocal;
      double *special_lj = force->special_lj;
      int newton_pair = force->newton_pair;
+     double comx = 0.0;

      inum = list->inum;
      ilist = list->ilist;
@@ -134,8 +135,10 @@ void PairLJCut::compute(int eflag, int vflag)
      evdw1,0.0,fpair,delx,dely,delz);
   }
 }
-)
+ comx += atom->rmass[i]*x[i][0]; /* BUG */
+ }
+ printf("comx = %g\n",comx);
 if (vflag_fdotr) virial_fdotr_compute();
 }
```

After recompiling LAMMPS and running the input you should get something like this:
12.3.1 Using the GDB debugger to get a stack trace

There are two options to use the GDB debugger for identifying the origin of the segmentation fault or similar crash. The GDB debugger has many more features and options, as can be seen for example its online documentation.

Run LAMMPS from within the debugger

Running LAMMPS under the control of the debugger as shown below only works for a single MPI rank (for debugging a program running in parallel you usually need a parallel debugger program). A simple way to launch GDB is to prefix the LAMMPS command line with `gdb --args` and then type the command “run” at the GDB prompt. This will launch the debugger, load the LAMMPS executable and its debug info, and then run it. When it reaches the code causing the segmentation fault, it will stop with a message why it stopped, print the current line of code, and drop back to the GDB prompt.

```
[...]  
Setting up Verlet run ...  
  Unit style : lj  
  Current step : 0  
  Time step : 0.005 

Program received signal SIGSEGV, Segmentation fault.  
0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag= 
   --optimized out) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139  
139   comx += atom->rmass[i]*x[i][0]; /* BUG */  
(gdb) 
```

Now typing the command “where” will show the stack of functions starting from the current function back to “main()”.

```
(gdb) where  
#0 0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag= 
   --optimized out) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139  
#1 0x00000000004cf0a2 in LAMMPS_NS::Verlet::setup (this=0x7e6c90, flag=1) at /home/ 
   akohlmey/compile/lammps/src/verlet.cpp:131  
#2 0x000000000049db42 in LAMMPS_NS::Run::command (this=this@entry=0x7fffffffcca0, 
   --narg=narg@entry=1, arg=arg@entry=0x7e8750)  
   at /home/akohlmey/compile/lammps/src/run.cpp:177  
#3 0x000000000041258a in LAMMPS_NS::Input::command_creator<LAMMPS_NS::Run> (lmp= 
   --optimized out, narg=1, arg=0x7e8750)  
   at /home/akohlmey/compile/lammps/src/input.cpp:878  
#4 0x0000000000410ad3 in LAMMPS_NS::Input::execute_command (this=0x7d1410) at /home/ 
   akohlmey/compile/lammps/src/input.cpp:864  
#5 0x00000000004111fb in LAMMPS_NS::Input::file (this=0x7d1410) at /home/akohlmey/ 
   compile/lammps/src/input.cpp:229  
#6 0x000000000040933a in main (argc=--optimized out, argv=--optimized out) at /home/ 
   akohlmey/compile/lammps/src/main.cpp:65  
(gdb) 
```

You can also print the value of variables and see if there is anything unexpected. Segmentation faults, for example, commonly happen when a pointer variable is not assigned and still initialized to NULL.

```
(gdb) print x 
$1 = (double **) 0x7ffff7ca1010  
(gdb) print i 
$2 = 0  
(gdb) print x[0] 
$3 = (double *) 0x7ffff6d80010 
```
Inspect a core dump file with the debugger

When an executable crashes with a “core dumped” message, it creates a file “core” or “core.<PID#>” which contains the information about the current state. This file may be located in the folder where you ran LAMMPS or in some hidden folder managed by the systemd daemon. In the latter case, you need to “extract” the core file with the `coredumpctl` utility to the current folder. Example: `coredumpctl -o core dump lmp`. Now you can launch the debugger to load the executable, its debug info and the core dump and drop you to a prompt like before.

From here on, you use the same commands as shown before to get a stack trace and print current values of (pointer) variables.

12.3.2 Using valgrind to get a stack trace

The valgrind suite of tools allows to closely inspect the behavior of a compiled program by essentially emulating a CPU and instrumenting the program while running. This slows down execution quite significantly, but can also report issues that are not resulting in a crash. The default valgrind tool is a memory checker and you can use it by prefixing the normal command line with `valgrind`. Unlike GDB, this will also work for parallel execution, but it is recommended to redirect the valgrind output to a file (e.g. with `--log-file=crash-%p.txt`, the %p will be substituted with the process ID) so that the messages of the multiple valgrind instances to the console are not mixed.

12.3. Debugging crashes

(continues on next page)
As you can see, the stack trace information is similar to that obtained from GDB. In addition you get a more specific hint about what caused the segmentation fault, i.e. that it is a NULL pointer dereference. To find out which pointer exactly was NULL, you need to use the debugger, though.

12.4 Error messages

This is an alphabetic list of the ERROR messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. Error messages also list the source file and line number where the error was generated. For example, a message like this:

```
ERROR: Illegal velocity command (velocity.cpp:78)
```

means that line #78 in the file src/velocity.cpp generated the error. Looking in the source code may help you figure out what went wrong.

Note that error messages from user-contributed packages are not listed here. If such an error occurs and is not self-explanatory, you will need to look in the source code or contact the author of the package.

Doc page with WARNING messages

1-3 bond count is inconsistent An inconsistency was detected when computing the number of 1-3 neighbors for each atom. This likely means something is wrong with the bond topologies you have defined.
**1-4 bond count is inconsistent**  An inconsistency was detected when computing the number of 1-4 neighbors for each atom. This likely means something is wrong with the bond topologies you have defined.

**Accelerator sharing is not currently supported on system**  Multiple MPI processes cannot share the accelerator on your system. For NVIDIA GPUs, see the nvidia-smi command to change this setting.

**All angle coeffs are not set**  All angle coefficients must be set in the data file or by the angle_coeff command before running a simulation.

**All atom IDs = 0 but atom_modify id = yes**  Self-explanatory.

**All atoms of a swapped type must have same charge.**  Self-explanatory.

**All atoms of a swapped type must have the same charge.**  Self-explanatory.

**All bond coeffs are not set**  All bond coefficients must be set in the data file or by the bond_coeff command before running a simulation.

**All dihedral coeffs are not set**  All dihedral coefficients must be set in the data file or by the dihedral_coeff command before running a simulation.

**All improper coeffs are not set**  All improper coefficients must be set in the data file or by the improper_coeff command before running a simulation.

**All masses are not set**  For atom styles that define masses for each atom type, all masses must be set in the data file or by the mass command before running a simulation. They must also be set before using the velocity command.

**All mol IDs should be set for fix gcmc group atoms**  The molecule flag is on, yet not all molecule ids in the fix group have been set to non-zero positive values by the user. This is an error since all atoms in the fix gcmc group are eligible for deletion, rotation, and translation and therefore must have valid molecule ids.

**All pair coeffs are not set**  All pair coefficients must be set in the data file or by the pair_coeff command before running a simulation.

**All read_dump x,y,z fields must be specified for scaled, triclinic coords**  For triclinic boxes and scaled coordinates you must specify all 3 of the x,y,z fields, else LAMMPS cannot reconstruct the unscaled coordinates.

**All universe/uloop variables must have same # of values**  Self-explanatory.

**All variables in next command must be same style**  Self-explanatory.

**Angle atom missing in delete_bonds**  The delete_bonds command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

**Angle atom missing in set command**  The set command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

**Angle atoms %d %d %d missing on proc %d at step %ld**  One or more of 3 atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

**Angle atoms missing on proc %d at step %ld**  One or more of 3 atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

**Angle coeff for hybrid has invalid style**  Angle style hybrid uses another angle style as one of its coefficients. The angle style used in the angle_coeff command or read from a restart file is not recognized.

**Angle coeffs are not set**  No angle coefficients have been assigned in the data file or via the angle_coeff command.

**Angle extent > half of periodic box length**  This error was detected by the neigh_modify check yes setting. It is an error because the angle atoms are so far apart it is ambiguous how it should be defined.

**Angle potential must be defined for SHAKE**  When shaking angles, an angle_style potential must be used.
Angle style hybrid cannot have hybrid as an argument  Self-explanatory.
Angle style hybrid cannot have none as an argument  Self-explanatory.
Angle style hybrid cannot use same angle style twice  Self-explanatory.
Angle table must range from 0 to 180 degrees  Self-explanatory.
Angle table parameters did not set N  List of angle table parameters must include N setting.
Angle_coeff command before angle_style is defined  Coefficients cannot be set in the data file or via the angle_coeff command until an angle_style has been assigned.
Angle_coeff command before simulation box is defined  The angle_coeff command cannot be used before a read_data, read_restart, or create_box command.
Angle_coeff command when no angles allowed  The chosen atom style does not allow for angles to be defined.
Angle_style command when no angles allowed  The chosen atom style does not allow for angles to be defined.
Angles assigned incorrectly  Angles read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.
Angles defined but no angle types  The data file header lists angles but no angle types.
Append boundary must be shrink/minimum  The boundary style of the face where atoms are added must be of type m (shrink/minimum).
Arccos of invalid value in variable formula  Argument of arccos() must be between -1 and 1.
Arcsin of invalid value in variable formula  Argument of arcsin() must be between -1 and 1.
Assigning body parameters to non-body atom  Self-explanatory.
Assigning ellipsoid parameters to non-ellipsoid atom  Self-explanatory.
Assigning line parameters to non-line atom  Self-explanatory.
Assigning quat to non-body atom  Self-explanatory.
Assigning tri parameters to non-tri atom  Self-explanatory.
At least one atom of each swapped type must be present to define charges.  Self-explanatory.
Atom IDs must be consecutive for velocity create loop all  Self-explanatory.
Atom IDs must be used for molecular systems  Atom IDs are used to identify and find partner atoms in bonds.
Atom count changed in fix neb  This is not allowed in a NEB calculation.
Atom count is inconsistent, cannot write data file  The sum of atoms across processors does not equal the global number of atoms. Probably some atoms have been lost.
Atom count is inconsistent, cannot write restart file  Sum of atoms across processors does not equal initial total count. This is probably because you have lost some atoms.
Atom in too many rigid bodies - boost MAXBODY  Fix poems has a parameter MAXBODY (in fix_poems.cpp) which determines the maximum number of rigid bodies a single atom can belong to (i.e. a multibody joint). The bodies you have defined exceed this limit.
Atom sort did not operate correctly  This is an internal LAMMPS error. Please report it to the developers.
Atom style hybrid cannot have hybrid as an argument  Self-explanatory.
Atom style hybrid cannot use same atom style twice  Self-explanatory.
Atom style template molecule must have atom types  The defined molecule(s) does not specify atom types.
Atom style was redefined after using fix property/atom  This is not allowed.
Atom type must be zero in fix gcmc mol command  Self-explanatory.

Atom vector in equal-style variable formula  Atom vectors generate one value per atom which is not allowed in an equal-style variable.

Atom-style variable in equal-style variable formula  Atom-style variables generate one value per atom which is not allowed in an equal-style variable.

Atom_modify id command after simulation box is defined  The atom_modify id command cannot be used after a read_data, read_restart, or create_box command.

Atom_modify map command after simulation box is defined  The atom_modify map command cannot be used after a read_data, read_restart, or create_box command.

Atom_modify sort and first options cannot be used together  Self-explanatory.

Atom_style command after simulation box is defined  The atom_style command cannot be used after a read_data, read_restart, or create_box command.

Atom_style line can only be used in 2d simulations  Self-explanatory.

Atom_style tri can only be used in 3d simulations  Self-explanatory.

Atomfile variable could not read values  Check the file assigned to the variable.

Atomfile variable in equal-style variable formula  Self-explanatory.

Atomfile-style variable in equal-style variable formula  Self-explanatory.

Attempt to pop empty stack in fix box/relax  Internal LAMMPS error. Please report it to the developers.

Attempt to push beyond stack limit in fix box/relax  Internal LAMMPS error. Please report it to the developers.

Attempting to rescale a 0.0 temperature  Cannot rescale a temperature that is already 0.0.

Attempting to insert more particles than available lattice points  Self-explanatory.

Bad FENE bond  Two atoms in a FENE bond have become so far apart that the bond cannot be computed.

Bad TIP4P angle type for PPPM/TIP4P  Specified angle type is not valid.

Bad TIP4P angle type for PPPMDisp/TIP4P  Specified angle type is not valid.

Bad TIP4P bond type for PPPM/TIP4P  Specified bond type is not valid.

Bad TIP4P bond type for PPPMDisp/TIP4P  Specified bond type is not valid.

Bad fix ID in fix append/atoms command  The value of the fix_id for keyword spatial must start with “f_”.

Bad grid of processors  The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

Bad kspace_modify kmax/ewald parameter  Kspace_modify values for the kmax/ewald keyword must be integers > 0

Bad kspace_modify slab parameter  Kspace_modify value for the slab/volume keyword must be >= 2.0.

Bad matrix inversion in mldivide3  This error should not occur unless the matrix is badly formed.

Bad principal moments  Fix rigid did not compute the principal moments of inertia of a rigid group of atoms correctly.

Bad quadratic solve for particle/line collision  This is an internal error. It should normally not occur.

Bad quadratic solve for particle/tri collision  This is an internal error. It should normally not occur.

Bad real space Coulombic cutoff in fix tune/kspace  Fix tune/kspace tried to find the optimal real space Coulombic cutoff using the Newton-Raphson method, but found a non-positive or NaN cutoff
Balance command before simulation box is defined  The balance command cannot be used before a read_data, read_restart, or create_box command.

Balance produced bad splits  This should not occur. It means two or more cutting plane locations are on top of each other or out of order. Report the problem to the developers.

Balance rcb cannot be used with comm_style brick  Comm_style tiled must be used instead.

Balance shift string is invalid  The string can only contain the characters “x”, “y”, or “z”.

Bias compute does not calculate a velocity bias  The specified compute must compute a bias for temperature.

Bias compute does not calculate temperature  The specified compute must compute temperature.

Bias compute group does not match compute group  The specified compute must operate on the same group as the parent compute.

Big particle in fix srd cannot be point particle  Big particles must be extended spheroids or ellipsoids.

BigInt setting in lmptype.h is invalid  Size of bigint is less than size of tagint.

BigInt setting in lmptype.h is not compatible  Format of bigint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Bitmapped lookup tables require int/float be same size  Cannot use pair tables on this machine, because of word sizes. Use the pair_modify command with table 0 instead.

Bitmapped table in file does not match requested table  Setting for bitmapped table in pair_coeff command must match table in file exactly.

Bitmapped table is incorrect length in table file  Number of table entries is not a correct power of 2.

Bond and angle potentials must be defined for TIP4P  Cannot use TIP4P pair potential unless bond and angle potentials are defined.

Bond atom missing in box size check  The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atom missing in delete_bonds  The delete_bonds command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

Bond atom missing in image check  The second atom in a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atom missing in set command  The set command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

Bond atoms %d %d missing on proc %d at step %ld  The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atoms missing on proc %d at step %ld  The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond coeff for hybrid has invalid style  Bond style hybrid uses another bond style as one of its coefficients. The bond style used in the bond_coeff command or read from a restart file is not recognized.

Bond coeffs are not set  No bond coefficients have been assigned in the data file or via the bond_coeff command.

Bond extent > half of periodic box length  This error was detected by the neigh_modify check yes setting. It is an error because the bond atoms are so far apart it is ambiguous how it should be defined.

Bond potential must be defined for SHAKE  Cannot use fix shake unless bond potential is defined.
Bond style hybrid cannot have hybrid as an argument  Self-explanatory.
Bond style hybrid cannot have none as an argument  Self-explanatory.
Bond style hybrid cannot use same bond style twice  Self-explanatory.
Bond style quartic cannot be used with 3,4-body interactions  No angle, dihedral, or improper styles can be defined when using bond style quartic.
Bond style quartic cannot be used with atom style template  This bond style can change the bond topology which is not allowed with this atom style.
Bond style quartic requires special_bonds = 1,1,1  This is a restriction of the current bond quartic implementation.
Bond table parameters did not set N  List of bond table parameters must include N setting.
Bond table values are not increasing  The values in the tabulated file must be monotonically increasing.
BondAngle coeff for hybrid angle has invalid format  No “ba” field should appear in data file entry.
BondBond coeff for hybrid angle has invalid format  No “bb” field should appear in data file entry.
Bond_coeff command before bond_style is defined  Coefficients cannot be set in the data file or via the bond_coeff command until an bond_style has been assigned.
Bond_coeff command before simulation box is defined  The bond_coeff command cannot be used before a read_data, read_restart, or create_box command.
Bond_coeff command when no bonds allowed  The chosen atom style does not allow for bonds to be defined.
Bond_style command when no bonds allowed  The chosen atom style does not allow for bonds to be defined.
Bonds assigned incorrectly  Bonds read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.
Bonds defined but no bond types  The data file header lists bonds but no bond types.
Bond/react: Cannot use fix bond/react with non-molecular systems  Only systems with bonds that can be changed can be used. Atom_style template does not qualify.
Bond/react: Invalid template atom ID in map file  Atom IDs in molecule templates range from 1 to the number of atoms in the template.
Bond/react: Rmax cutoff is longer than pairwise cutoff  This is not allowed because bond creation is done using the pairwise neighbor list.
Bond/react: Molecule template ID for fix bond/react does not exist  A valid molecule template must have been created with the molecule command.
Bond/react: Reaction templates must contain the same number of atoms  There should be a one-to-one correspondence between atoms in the pre-reacted and post-reacted templates, as specified by the map file.
Bond/react: Unknown section in map file  Please ensure reaction map files are properly formatted.
Bond/react: Atom/Bond type affected by reaction too close to template edge  This means an atom which changes type or connectivity during the reaction is too close to an ‘edge’ atom defined in the map file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.
Bond/react: Fix bond/react needs ghost atoms from farther away  This is because a processor needs to map the entire unreacted molecule template onto simulation atoms it knows about. The comm_modify cutoff command can be used to extend the communication range.
Bond/react: A deleted atom cannot remain bonded to an atom that is not deleted  Self-explanatory.
Bond/react: First neighbors of chiral atoms must be of mutually different types  Self-explanatory.
Bond/react: Chiral atoms must have exactly four first neighbors Self-explanatory.

Bond/react: Molecule template ‘Coords’ section required for chiralityIDs keyword The coordinates of atoms in the pre-reacted template are used to determine chirality.

Bond/react special bond generation overflow The number of special bonds per-atom created by a reaction exceeds the system setting. See the read_data or create_box command for how to specify this value.

Bond/react topology/atom exceed system topology/atom The number of bonds, angles etc per-atom created by a reaction exceeds the system setting. See the read_data or create_box command for how to specify this value.

Both restart files must use % or neither Self-explanatory.

Both restart files must use MPI-IO or neither Self-explanatory.

Both sides of boundary must be periodic Cannot specify a boundary as periodic only on the lo or hi side. Must be periodic on both sides.

Boundary command after simulation box is defined The boundary command cannot be used after a read_data, read_restart, or create_box command.

Box bounds are invalid The box boundaries specified in the read_data file are invalid. The lo value must be less than the hi value for all 3 dimensions.

Box command after simulation box is defined The box command cannot be used after a read_data, read_restart, or create_box command.

CPU neighbor lists must be used for ellipsoid/sphere mix. When using Gay-Berne or RE-squared pair styles with both ellipsoidal and spherical particles, the neighbor list must be built on the CPU

Can not specify Pxy/Pxz/Pyz in fix box/relax with non-triclinic box Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

Can not specify Pxy/Pxz/Pyz in fix nvt/npt/nph with non-triclinic box Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

Can only use -plog with multiple partitions Self-explanatory. See doc page discussion of command-line switches.

Can only use -pscreen with multiple partitions Self-explanatory. See doc page discussion of command-line switches.

Can only use Kokkos supported regions with Kokkos package Self-explanatory.

Can only use NEB with 1-processor replicas This is current restriction for NEB as implemented in LAMMPS.

Can only use TAD with 1-processor replicas for NEB This is current restriction for NEB as implemented in LAMMPS.

Cannot (yet) do analytic differentiation with ppm/gpu This is a current restriction of this command.

Cannot (yet) request ghost atoms with Kokkos half neighbor list This feature is not yet supported.

Cannot (yet) use ‘electron’ units with dipoles This feature is not yet supported.

Cannot (yet) use Ewald with triclinic box and slab correction This feature is not yet supported.

Cannot (yet) use K-space slab correction with compute group/group for triclinic systems This option is not yet supported.

Cannot (yet) use MSM with 2d simulation This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and TIP4P This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and kspace_modify diff ad This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and slab correction This feature is not yet supported.
Cannot (yet) use kspace slab correction with long-range dipoles and non-neutral systems or per-atom energy  This feature is not yet supported.

Cannot (yet) use kspace_modify diff ad with compute group/group  This option is not yet supported.

Cannot (yet) use kspace_style pppm/stagger with triclinic systems  This feature is not yet supported.

Cannot (yet) use molecular templates with Kokkos  Self-explanatory.

Cannot (yet) use respa with Kokkos  Self-explanatory.

Cannot (yet) use rigid bodies with fix deform and Kokkos  Self-explanatory.

Cannot (yet) use rigid bodies with fix nh and Kokkos  Self-explanatory.

Cannot (yet) use single precision with MSM (remove -DFFT_SINGLE from Makefile and re-compile)  Single precision cannot be used with MSM.

Cannot add atoms to fix move variable  Atoms can not be added afterwards to this fix option.

Cannot append atoms to a triclinic box  The simulation box must be defined with edges aligned with the Cartesian axes.

Cannot balance in z dimension for 2d simulation  Self-explanatory.

Cannot change box ortho/triclinic with certain fixes defined  This is because those fixes store the shape of the box. You need to use unfix to discard the fix, change the box, then redefine a new fix.

Cannot change box ortho/triclinic with dumps defined  This is because some dumps store the shape of the box. You need to use undump to discard the dump, change the box, then redefine a new dump.

Cannot change box tilt factors for orthogonal box  Cannot use tilt factors unless the simulation box is non-orthogonal.

Cannot change box to orthogonal when tilt is non-zero  Self-explanatory.

Cannot change box z boundary to non-periodic for a 2d simulation  Self-explanatory.

Cannot change dump_modify every for dump dcd  The frequency of writing dump dcd snapshots cannot be changed.

Cannot change dump_modify every for dump xtc  The frequency of writing dump xtc snapshots cannot be changed.

Cannot change timestep once fix srd is setup  This is because various SRD properties depend on the timestep size.

Cannot change timestep with fix pour  This is because fix pour pre-computes the time delay for particles to fall out of the insertion volume due to gravity.

Cannot change to comm_style brick from tiled layout  Self-explanatory.

Cannot change_box after reading restart file with per-atom info  This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

Cannot change_box in xz or yz for 2d simulation  Self-explanatory.

Cannot change_box in z dimension for 2d simulation  Self-explanatory.

Cannot clear group all  This operation is not allowed.

Cannot close restart file - MPI error: %s  This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot compute initial g_ewald_disp  LAMMPS failed to compute an initial guess for the PPPM_disp g_ewald_6 factor that partitions the computation between real space and k-space for Dispersion interactions.

Cannot create an atom map unless atoms have IDs  The simulation requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.
Cannot create atoms with undefined lattice Must use the lattice command before using the create_atoms command.

Cannot create/grow a vector/array of pointers for %s LAMMPS code is making an illegal call to the templated memory allocaters, to create a vector or array of pointers.

Cannot create atoms after reading restart file with per-atom info The per-atom info was stored to be used when by a fix that you may re-define. If you add atoms before re-defining the fix, then there will not be a correct amount of per-atom info.

Cannot create_box after simulation box is defined A simulation box can only be defined once.

Cannot currently use pair reax with pair hybrid This is not yet supported.

Cannot currently use pppm/gpu with fix balance Self-explanatory.

Cannot delete group all Self-explanatory.

Cannot delete group currently used by a compute Self-explanatory.

Cannot delete group currently used by a dump Self-explanatory.

Cannot delete group currently used by a fix Self-explanatory.

Cannot delete group currently used by atom_modify_first Self-explanatory.

Cannot delete_atoms bond yes for non-molecular systems Self-explanatory.

Cannot displace_atoms after reading restart file with per-atom info This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

Cannot do GCMC on atoms in atom_modify_first group This is a restriction due to the way atoms are organized in a list to enable the atom_modify_first command.

Cannot do atom/swap on atoms in atom_modify_first group This is a restriction due to the way atoms are organized in a list to enable the atom_modify_first command.

Cannot dump sort on atom IDs with no atom IDs defined Self-explanatory.

Cannot dump sort when multiple dump files are written In this mode, each processor dumps its atoms to a file, so no sorting is allowed.

Cannot embed Python when also extending Python with LAMMPS When running LAMMPS via Python through the LAMMPS library interface you cannot also user the input script python command.

Cannot evaporate atoms in atom_modify_first group This is a restriction due to the way atoms are organized in a list to enable the atom_modify_first command.

Cannot find create_bonds group ID Self-explanatory.

Cannot find delete_bonds group ID Group ID used in the delete_bonds command does not exist.

Cannot find specified group ID for core particles Self-explanatory.

Cannot find specified group ID for shell particles Self-explanatory.

Cannot have both pair_modify shift and tail set to yes These 2 options are contradictory.

Cannot intersect groups using a dynamic group This operation is not allowed.

Cannot mix molecular and molecule template atom styles Self-explanatory.

Cannot open -reorder file Self-explanatory.

Cannot open ADP potential file %s The specified ADP potential file cannot be opened. Check that the path and name are correct.
Cannot open AIREBO potential file %s  The specified AIREBO potential file cannot be opened. Check that the path and name are correct.

Cannot open BOP potential file %s  The specified BOP potential file cannot be opened. Check that the path and name are correct.

Cannot open COMB potential file %s  The specified COMB potential file cannot be opened. Check that the path and name are correct.

Cannot open COMB3 lib.comb3 file  The COMB3 library file cannot be opened. Check that the path and name are correct.

Cannot open COMB3 potential file %s  The specified COMB3 potential file cannot be opened. Check that the path and name are correct.

Cannot open EAM potential file %s  The specified EAM potential file cannot be opened. Check that the path and name are correct.

Cannot open EIM potential file %s  The specified EIM potential file cannot be opened. Check that the path and name are correct.

Cannot open LCBOP potential file %s  The specified LCBOP potential file cannot be opened. Check that the path and name are correct.

Cannot open MEAM potential file %s  The specified MEAM potential file cannot be opened. Check that the path and name are correct.

Cannot open SNAP coefficient file %s  The specified SNAP coefficient file cannot be opened. Check that the path and name are correct.

Cannot open SNAP parameter file %s  The specified SNAP parameter file cannot be opened. Check that the path and name are correct.

Cannot open Stillinger-Weber potential file %s  The specified SW potential file cannot be opened. Check that the path and name are correct.

Cannot open Tersoff potential file %s  The specified potential file cannot be opened. Check that the path and name are correct.

Cannot open Vashishta potential file %s  The specified Vashishta potential file cannot be opened. Check that the path and name are correct.

Cannot open balance output file  Self-explanatory.

Cannot open coul/streitz potential file %s  The specified coul/streitz potential file cannot be opened. Check that the path and name are correct.

Cannot open custom file  Self-explanatory.

Cannot open data file %s  The specified file cannot be opened. Check that the path and name are correct.

Cannot open dir to search for restart file  Using a “*” in the name of the restart file will open the current directory to search for matching file names.

Cannot open dump file  Self-explanatory.

Cannot open dump file %s  The output file for the dump command cannot be opened. Check that the path and name are correct.

Cannot open file %s  The specified file cannot be opened. Check that the path and name are correct. If the file is a compressed file, also check that the gzip executable can be found and run.

Cannot open file variable file %s  The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/chunk file %s  The specified file cannot be opened. Check that the path and name are correct.
Cannot open fix ave/correlate file %s The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/histo file %s The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/time file %s The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix balance output file Self-explanatory.

Cannot open fix poems file %s The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix print file %s The output file generated by the fix print command cannot be opened

Cannot open fix qeq parameter file %s The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix qeq/comb file %s The output file for the fix qeq/combs command cannot be opened. Check that the path and name are correct.

Cannot open fix reax/bonds file %s The output file for the fix reax/bonds command cannot be opened. Check that the path and name are correct.

Cannot open rigid infile %s The specified file cannot be opened. Check that the path and name are correct.

Cannot open rigid restart file %s The specified file cannot be opened. Check that the path and name are correct.

Cannot open rigid/small infile %s The specified file cannot be opened. Check that the path and name are correct.

Cannot open tmd file %s The output file for the fix tmd command cannot be opened. Check that the path and name are correct.

Cannot open ttm file %s The output file for the fix ttm command cannot be opened. Check that the path and name are correct.

Cannot open gzipped file LAMMPS was compiled without support for reading and writing gzipped files through a pipeline to the gzip program with -DLAMMPS_GZIP.

Cannot open input script %s Self-explanatory.

Cannot open log.cite file This file is created when you use some LAMMPS features, to indicate what paper you should cite on behalf of those who implemented the feature. Check that you have write privileges into the directory you are running in.

Cannot open log.lammps for writing The default LAMMPS log file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open logfile The LAMMPS log file named in a command-line argument cannot be opened. Check that the path and name are correct.

Cannot open logfile %s The LAMMPS log file specified in the input script cannot be opened. Check that the path and name are correct.

Cannot open molecule file %s The specified file cannot be opened. Check that the path and name are correct.

Cannot open nb3h/harmonic potential file %s The specified potential file cannot be opened. Check that the path and name are correct.

Cannot open pair_write file The specified output file for pair energies and forces cannot be opened. Check that the path and name are correct.

Cannot open polymorphic potential file %s The specified polymorphic potential file cannot be opened. Check that the path and name are correct.

Cannot open print file %s Self-explanatory.

Cannot open processors output file Self-explanatory.

Cannot open restart file %s Self-explanatory.
Cannot open restart file for reading - MPI error: %s  This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot open restart file for writing - MPI error: %s  This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot open screen file  The screen file specified as a command-line argument cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open temporary file for world counter  Self-explanatory.

Cannot open universe log file  For a multi-partition run, the master log file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open universe screen file  For a multi-partition run, the master screen file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot read from restart file - MPI error: %s  This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot read_data without add keyword after simulation box is defined  Self-explanatory.

Cannot read_restart after simulation box is defined  The read_restart command cannot be used after a read_data, read_restart, or create_box command.

Cannot redefine variable as a different style  An equal-style variable can be re-defined but only if it was originally an equal-style variable.

Cannot replicate 2d simulation in z dimension  The replicate command cannot replicate a 2d simulation in the z dimension.

Cannot replicate with fixes that store atom quantities  Either fixes are defined that create and store atom-based vectors or a restart file was read which included atom-based vectors for fixes. The replicate command cannot duplicate that information for new atoms. You should use the replicate command before fixes are applied to the system.

Cannot reset timestep with a dynamic region defined  Dynamic regions (see the region command) have a time dependence. Thus you cannot change the timestep when one or more of these are defined.

Cannot reset timestep with a time-dependent fix defined  You cannot reset the timestep when a fix that keeps track of elapsed time is in place.

Cannot run 2d simulation with non-periodic Z dimension  Use the boundary command to make the z dimension periodic in order to run a 2d simulation.

Cannot set bond topology types for atom style template  The bond, angle, etc types cannot be changed for this atom style since they are static settings in the molecule template files.

Cannot set both respa pair and inner/middle/outer  In the rRESPA integrator, you must compute pairwise potentials either all together (pair), or in pieces (inner/middle/outer). You can’t do both.

Cannot set cutoff/multi before simulation box is defined  Self-explanatory.

Cannot set dpd/theta for this atom style  Self-explanatory.

Cannot set dump_modify flush for dump xtc  Self-explanatory.

Cannot set mass for this atom style  This atom style does not support mass settings for each atom type. Instead they are defined on a per-atom basis in the data file.

Cannot set meso/cv for this atom style  Self-explanatory.

Cannot set meso/e for this atom style  Self-explanatory.

Cannot set meso/rho for this atom style  Self-explanatory.
Cannot set non-zero image flag for non-periodic dimension  Self-explanatory.

Cannot set non-zero z velocity for 2d simulation  Self-explanatory.

Cannot set quaternion for atom that has none  Self-explanatory.

Cannot set quaternion with xy components for 2d system  Self-explanatory.

Cannot set respa hybrid and any of pair/inner/middle/outer  In the rRESPA integrator, you must compute pairwise potentials either all together (pair), with different cutoff regions (inner/middle/outer), or per hybrid sub-style (hybrid). You cannot mix those.

Cannot set respa middle without inner/outer  In the rRESPA integrator, you must define both a inner and outer setting in order to use a middle setting.

Cannot set restart file size - MPI error: %s  This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot set smd/contact/radius for this atom style  Self-explanatory.

Cannot set smd/mass/density for this atom style  Self-explanatory.

Cannot set temperature for fix rigid/nph  The temp keyword cannot be specified.

Cannot set theta for atom that is not a line  Self-explanatory.

Cannot set this attribute for this atom style  The attribute being set does not exist for the defined atom style.

Cannot set variable z velocity for 2d simulation  Self-explanatory.

Cannot skew triclinic box in z for 2d simulation  Self-explanatory.

Cannot subtract groups using a dynamic group  This operation is not allowed.

Cannot union groups using a dynamic group  This operation is not allowed.

Cannot use -kokkos on without KOKKOS installed  Self-explanatory.

Cannot use Ewald with 2d simulation  The kspace style ewald cannot be used in 2d simulations. You can use 2d Ewald in a 3d simulation; see the kspace_modify command.

Cannot use Ewald/disp solver on system with no charge, dipole, or LJ particles  No atoms in system have a non-zero charge or dipole, or are LJ particles. Change charges/dipoles or change options of the kspace solver/pair style.

Cannot use EwaldDisp with 2d simulation  This is a current restriction of this command.

Cannot use Kokkos pair style with rRESPA inner/middle  Self-explanatory.

Cannot use NEB unless atom map exists  Use the atom_modify command to create an atom map.

Cannot use NEB with a single replica  Self-explanatory.

Cannot use NEB with atom_modify sort enabled  This is current restriction for NEB implemented in LAMMPS.

Cannot use PPPM with 2d simulation  The kspace style pppm cannot be used in 2d simulations. You can use 2d PPPM in a 3d simulation; see the kspace_modify command.

Cannot use PPPMDisp with 2d simulation  The kspace style pppm/disp cannot be used in 2d simulations. You can use 2d pppm/disp in a 3d simulation; see the kspace_modify command.

Cannot use PRD with a changing box  The current box dimensions are not copied between replicas.

Cannot use PRD with a time-dependent fix defined  PRD alters the timestep in ways that will mess up these fixes.
Cannot use PRD with a time-dependent region defined  PRD alters the timestep in ways that will mess up these regions.

Cannot use PRD with atom_modify sort enabled  This is a current restriction of PRD. You must turn off sorting, which is enabled by default, via the atom_modify command.

Cannot use PRD with multi-processor replicas unless atom map exists  Use the atom_modify command to create an atom map.

Cannot use TAD unless atom map exists for NEB  See atom_modify map command to set this.

Cannot use TAD with a single replica for NEB  NEB requires multiple replicas.

Cannot use TAD with atom_modify sort enabled for NEB  This is a current restriction of NEB.

Cannot use a damped dynamics min style with fix box/relax  This is a current restriction in LAMMPS. Use another minimizer style.

Cannot use a damped dynamics min style with per-atom DOF  This is a current restriction in LAMMPS. Use another minimizer style.

Cannot use append/atoms in periodic dimension  The boundary style of the face where atoms are added can not be of type p (periodic).

Cannot use atomfile-style variable unless atom map exists  Self-explanatory. See the atom_modify command to create a map.

Cannot use both com and bias with compute temp/chunk  Self-explanatory.

Cannot use chosen neighbor list style with buck/coul/cut/kk  Self-explanatory.

Cannot use chosen neighbor list style with buck/coul/long/kk  Self-explanatory.

Cannot use chosen neighbor list style with buck/kk  That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/cut/kk  That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/debye/kk  Self-explanatory.

Cannot use chosen neighbor list style with coul/dsf/kk  That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/wolf/kk  That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/charmm/coul/charmm/implicit/kk  Self-explanatory.

Cannot use chosen neighbor list style with lj/charmm/coul/charmm/kk  Self-explanatory.

Cannot use chosen neighbor list style with lj/charmm/coul/long/kk  Self-explanatory.

Cannot use chosen neighbor list style with lj/class2/coul/cut/kk  Self-explanatory.

Cannot use chosen neighbor list style with lj/class2/coul/long/kk  Self-explanatory.

Cannot use chosen neighbor list style with lj/class2/kk  Self-explanatory.

Cannot use chosen neighbor list style with lj/cut/coul/cut/kk  That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/cut/coul/debye/kk  Self-explanatory.

Cannot use chosen neighbor list style with lj/cut/coul/long/kk  That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/expand/kk  Self-explanatory.

Cannot use chosen neighbor list style with lj/gromacs/coul/gromacs/kk  Self-explanatory.

Cannot use chosen neighbor list style with lj/gromacs/kk  Self-explanatory.
Cannot use chosen neighbor list style with lj/sdk/kk  That style is not supported by Kokkos.
Cannot use chosen neighbor list style with pair eam/kk  That style is not supported by Kokkos.
Cannot use chosen neighbor list style with pair eam/kk/alloy  Self-explanatory.
Cannot use chosen neighbor list style with pair eam/kk/fs  Self-explanatory.
Cannot use chosen neighbor list style with pair sw/kk  Self-explanatory.
Cannot use chosen neighbor list style with tersoff/kk  Self-explanatory.
Cannot use chosen neighbor list style with tersoff/zbl/kk  Self-explanatory.

Cannot use compute chunk/atom bin z for 2d model  Self-explanatory.
Cannot use compute cluster/atom unless atoms have IDs  Atom IDs are used to identify clusters.
Cannot use create_atoms rotate unless single style  Self-explanatory.
Cannot use create_bonds unless atoms have IDs  This command requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.
Cannot use create_bonds with non-molecular system  Self-explanatory.
Cannot use cwiggle in variable formula between runs  This is a function of elapsed time.
Cannot use delete_atoms bond yes with atom_style template  This is because the bonds for that atom style are hard-wired in the molecule template.
Cannot use delete_atoms unless atoms have IDs  Your atoms do not have IDs, so the delete_atoms command cannot be used.
Cannot use delete_bonds with non-molecular system  Your choice of atom style does not have bonds.
Cannot use dump_modify fileper without % in dump file name  Self-explanatory.
Cannot use dump_modify nfile without % in dump file name  Self-explanatory.
Cannot use dynamic group with fix adapt atom  This is not yet supported.
Cannot use fix TMD unless atom map exists  Using this fix requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom_modify map command will force an atom map to be created.
Cannot use fix bond/break with non-molecular systems  Only systems with bonds that can be changed can be used. Atom_style template does not qualify.
Cannot use fix bond/create with non-molecular systems  Only systems with bonds that can be changed can be used. Atom_style template does not qualify.
Cannot use fix bond/swap with non-molecular systems  Only systems with bonds that can be changed can be used. Atom_style template does not qualify.
Cannot use fix box/relax on a 2nd non-periodic dimension  When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.
Cannot use fix box/relax on a non-periodic dimension  When specifying a diagonal pressure component, the dimension must be periodic.
Cannot use fix box/relax with both relaxation and scaling on a tilt factor  When specifying scaling on a tilt factor component, that component can not also be controlled by the barostat. E.g. if scalexy yes is specified and also keyword tri or xy, this is wrong.
Cannot use fix box/relax with tilt factor scaling on a 2nd non-periodic dimension  When specifying scaling on a tilt factor component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix deform on a shrink-wrapped boundary  The x, y, z options cannot be applied to shrink-wrapped dimensions.

Cannot use fix deform tilt on a shrink-wrapped 2nd dim  This is because the shrink-wrapping will change the value of the strain implied by the tilt factor.

Cannot use fix deform trate on a box with zero tilt  The trate style alters the current strain.

Cannot use fix deposit rigid and not molecule  Self-explanatory.

Cannot use fix deposit rigid and shake  These two attributes are conflicting.

Cannot use fix deposit shake and not molecule  Self-explanatory.

Cannot use fix enforce2d with 3d simulation  Self-explanatory.

Cannot use fix gcmc in a 2d simulation  Fix gcmc is set up to run in 3d only. No 2d simulations with fix gcmc are allowed.

Cannot use fix gcmc shake and not molecule  Self-explanatory.

Cannot use fix msst without per-type mass defined  Self-explanatory.

Cannot use fix npt and fix deform on same component of stress tensor  This would be changing the same box dimension twice.

Cannot use fix nvt/npt/nph on a 2nd non-periodic dimension  When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix nvt/npt/nph on a non-periodic dimension  When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix nvt/npt/nph with both xy dynamics and xy scaling  Self-explanatory.

Cannot use fix nvt/npt/nph with both xz dynamics and xz scaling  Self-explanatory.

Cannot use fix nvt/npt/nph with both yz dynamics and yz scaling  Self-explanatory.

Cannot use fix nvt/npt/nph with xy scaling when y is non-periodic dimension  The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix nvt/npt/nph with xz scaling when z is non-periodic dimension  The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix nvt/npt/nph with yz scaling when z is non-periodic dimension  The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix pour rigid and not molecule  Self-explanatory.

Cannot use fix pour rigid and shake  These two attributes are conflicting.

Cannot use fix pour shake and not molecule  Self-explanatory.

Cannot use fix pour with triclinic box  This option is not yet supported.

Cannot use fix press/berendsen and fix deform on same component of stress tensor  These commands both change the box size/shape, so you cannot use both together.

Cannot use fix press/berendsen on a non-periodic dimension  Self-explanatory.

Cannot use fix press/berendsen with triclinic box  Self-explanatory.
Cannot use fix reax/bonds without pair_style reax  Self-explanatory.

Cannot use fix rigid npt/nph and fix deform on same component of stress tensor This would be changing the same box dimension twice.

Cannot use fix rigid npt/nph on a non-periodic dimension When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix rigid/small npt/nph on a non-periodic dimension When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix shake with non-molecular system Your choice of atom style does not have bonds.

Cannot use fix ttm with 2d simulation This is a current restriction of this fix due to the grid it creates.

Cannot use fix ttm with triclinic box This is a current restriction of this fix due to the grid it creates.

Cannot use fix tune/kspace without a kspace style Self-explanatory.

Cannot use fix tune/kspace without a pair style This fix (tune/kspace) can only be used when a pair style has been specified.

Cannot use fix wall in periodic dimension Self-explanatory.

Cannot use fix wall zlo/zhi for a 2d simulation Self-explanatory.

Cannot use fix wall/reflect in periodic dimension Self-explanatory.

Cannot use fix wall/reflect zlo/zhi for a 2d simulation Self-explanatory.

Cannot use fix wall/srd in periodic dimension Self-explanatory.

Cannot use fix wall/srd more than once Nor is there a need to since multiple walls can be specified in one command.

Cannot use fix wall/srd without fix srd Self-explanatory.

Cannot use fix wall/srd zlo/zhi for a 2d simulation Self-explanatory.

Cannot use fix_deposit unless atoms have IDs Self-explanatory.

Cannot use fix_pour unless atoms have IDs Self-explanatory.

Cannot use include command within an if command Self-explanatory.

Cannot use lines with fix srd unless overlap is set This is because line segments are connected to each other.

Cannot use multiple fix wall commands with pair brownian Self-explanatory.

Cannot use multiple fix wall commands with pair lubricate Self-explanatory.

Cannot use multiple fix wall commands with pair lubricate/poly Self-explanatory.

Cannot use multiple fix wall commands with pair lubricateU Self-explanatory.

Cannot use neigh_modify exclude with GPU neighbor builds This is a current limitation of the GPU implementation in LAMMPS.

Cannot use neighbor bins - box size << cutoff Too many neighbor bins will be created. This typically happens when the simulation box is very small in some dimension, compared to the neighbor cutoff. Use the “nsq” style instead of “bin” style.

Cannot use newton pair with beck/gpu pair style Self-explanatory.

Cannot use newton pair with born/coul/long/gpu pair style Self-explanatory.

Cannot use newton pair with born/coul/wolf/gpu pair style Self-explanatory.

Cannot use newton pair with born/gpu pair style Self-explanatory.
Cannot use newton pair with buck/coul/cut/gpu pair style  Self-explanatory.
Cannot use newton pair with buck/coul/long/gpu pair style  Self-explanatory.
Cannot use newton pair with buck/gpu pair style  Self-explanatory.
Cannot use newton pair with colloid/gpu pair style  Self-explanatory.
Cannot use newton pair with coul/cut/gpu pair style  Self-explanatory.
Cannot use newton pair with coul/debye/gpu pair style  Self-explanatory.
Cannot use newton pair with coul/dsf/gpu pair style  Self-explanatory.
Cannot use newton pair with coul/long/gpu pair style  Self-explanatory.
Cannot use newton pair with coul/debye/gpu pair style  Self-explanatory.
Cannot use newton pair with coul/dsf/gpu pair style  Self-explanatory.
Cannot use newton pair with coul/long/gpu pair style  Self-explanatory.
Cannot use newton pair with dipole/cut/gpu pair style  Self-explanatory.
Cannot use newton pair with dipole/sf/gpu pair style  Self-explanatory.
Cannot use newton pair with dpd/gpu pair style  Self-explanatory.
Cannot use newton pair with dpd/tstat/gpu pair style  Self-explanatory.
Cannot use newton pair with eam/alloy/gpu pair style  Self-explanatory.
Cannot use newton pair with eam/fs/gpu pair style  Self-explanatory.
Cannot use newton pair with eam/gpu pair style  Self-explanatory.
Cannot use newton pair with gauss/gpu pair style  Self-explanatory.
Cannot use newton pair with gayberne/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/charmm/coul/long/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/class2/coul/long/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/class2/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/cubic/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/cut/coul/cut/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/cut/coul/debye/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/cut/coul/dsf/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/cut/coul/long/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/cut/coul/msm/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/cut/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/expand/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/gromacs/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/sdk/coul/long/gpu pair style  Self-explanatory.
Cannot use newton pair with lj/sdk/gpu pair style  Self-explanatory.
Cannot use newton pair with lj96/cut/gpu pair style  Self-explanatory.
Cannot use newton pair with mie/cut/gpu pair style  Self-explanatory.
Cannot use newton pair with morse/gpu pair style  Self-explanatory.
Cannot use newton pair with resquared/gpu pair style  Self-explanatory.
Cannot use newton pair with soft/gpu pair style  Self-explanatory.
Cannot use newton pair with table/gpu pair style  Self-explanatory.
Cannot use newton pair with yukawa/colloid/gpu pair style  Self-explanatory.
Cannot use newton pair with yukawa/gpu pair style  Self-explanatory.
Cannot use newton pair with zbl/gpu pair style  Self-explanatory.

Cannot use non-zero forces in an energy minimization  Fix setforce cannot be used in this manner. Use fix addforce instead.

Cannot use non-periodic boundaries with fix ttm  This fix requires a fully periodic simulation box.
Cannot use non-periodic boundaries with Ewald  For kspace style ewald, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.
Cannot use non-periodic boundaries with EwaldDisp  For kspace style ewald/disp, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.
Cannot use non-periodic boundaries with PPPM  For kspace style ppm, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.
Cannot use non-periodic boundaries with PPPMDisp  For kspace style ppm/disp, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use order greater than 8 with ppm/gpu.  Self-explanatory.

Cannot use package gpu neigh yes with triclinic box  This is a current restriction in LAMMPS.

Cannot use pair tail corrections with 2d simulations  The correction factors are only currently defined for 3d systems.

Cannot use processors part command without using partitions  See the command-line -partition switch.

Cannot use ramp in variable formula between runs  This is because the ramp() function is time dependent.

Cannot use read_data add before simulation box is defined  Self-explanatory.

Cannot use read_data extra with add flag  Self-explanatory.

Cannot use read_data offset without add flag  Self-explanatory.

Cannot use read_data shift without add flag  Self-explanatory.

Cannot use region INF or EDGE when box does not exist  Regions that extend to the box boundaries can only be used after the create_box command has been used.

Cannot use set atom with no atom IDs defined  Atom IDs are not defined, so they cannot be used to identify an atom.

Cannot use set mol with no molecule IDs defined  Self-explanatory.

Cannot use swiggle in variable formula between runs  This is a function of elapsed time.

Cannot use tris with fix srd unless overlap is set  This is because triangles are connected to each other.

Cannot use variable energy with constant efield in fix efield  LAMMPS computes the energy itself when the E-field is constant.

Cannot use variable energy with constant force in fix addforce  This is because for constant force, LAMMPS can compute the change in energy directly.

Cannot use variable every setting for dump dcd  The format of DCD dump files requires snapshots be output at a constant frequency.

Cannot use variable every setting for dump xtc  The format of this file requires snapshots at regular intervals.

Cannot use vdisplace in variable formula between runs  This is a function of elapsed time.
Cannot use velocity bias command without temp keyword  Self-explanatory.

Cannot use velocity create loop all unless atoms have IDs  Atoms in the simulation to do not have IDs, so this style of velocity creation cannot be performed.

Cannot use wall in periodic dimension  Self-explanatory.

Cannot use write_restart fileper without % in restart file name  Self-explanatory.

Cannot use write_restart nfile without % in restart file name  Self-explanatory.

Cannot wiggle and shear fix wall/gran  Cannot specify both options at the same time.

Cannot write to restart file - MPI error: %s This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot yet use KSpace solver with grid with comm style tiled  This is current restriction in LAMMPS.

Cannot yet use comm_style tiled with multi-mode comm  Self-explanatory.

Cannot yet use comm_style tiled with triclinic box  Self-explanatory.

Cannot yet use compute tally with Kokkos  This feature is not yet supported.

Cannot yet use fix bond/break with this improper style  This is a current restriction in LAMMPS.

Cannot yet use fix bond/create with this improper style  This is a current restriction in LAMMPS.

Cannot yet use minimize with Kokkos  This feature is not yet supported.

Cannot yet use pair hybrid with Kokkos  This feature is not yet supported.

Cannot zero Langevin force of 0 atoms  The group has zero atoms, so you cannot request its force be zeroed.

Cannot zero gld force for zero atoms  There are no atoms currently in the group.

Cannot zero momentum of no atoms  Self-explanatory.

Change_box command before simulation box is defined  Self-explanatory.

Change_box volume used incorrectly  The “dim volume” option must be used immediately following one or two settings for “dim1 . . .” (and optionally “dim2 . . .”) and must be for a different dimension, i.e. dim != dim1 and dim != dim2.

Chunk/atom compute does not exist for compute angmom/chunk  Self-explanatory.

Chunk/atom compute does not exist for compute com/chunk  Self-explanatory.

Chunk/atom compute does not exist for compute gyration/chunk  Self-explanatory.

Chunk/atom compute does not exist for compute inertia/chunk  Self-explanatory.

Chunk/atom compute does not exist for compute msd/chunk  Self-explanatory.

Chunk/atom compute does not exist for compute omega/chunk  Self-explanatory.

Chunk/atom compute does not exist for compute property/chunk  Self-explanatory.

Chunk/atom compute does not exist for compute temp/chunk  Self-explanatory.

Chunk/atom compute does not exist for compute torque/chunk  Self-explanatory.

Chunk/atom compute does not exist for compute vcm/chunk  Self-explanatory.

Chunk/atom compute does not exist for fix ave/chunk  Self-explanatory.

Comm tiled invalid index in box drop brick  Internal error check in comm_style tiled which should not occur. Contact the developers.
**Comm tiled mis-match in box drop brick** Internal error check in comm_style tiled which should not occur. Contact the developers.

**Comm_modify group != atom_modify first group** Self-explanatory.

**Communication cutoff for comm_style tiled cannot exceed periodic box length** Self-explanatory.

**Communication cutoff too small for SNAP micro load balancing** This can happen if you change the neighbor skin after your pair_style command or if your box dimensions grow during a run. You can set the cutoff explicitly via the comm_modify cutoff command.

**Compute %s does not allow use of dynamic group** Dynamic groups have not yet been enabled for this compute.

**Compute for fix pafi does not calculate a local array** Self-explanatory.

**Compute for fix pafi must have 9 fields per atom** Self-explanatory.

**Compute ID for compute chunk /atom does not exist** Self-explanatory.

**Compute ID for compute chunk/atom does not exist** Self-explanatory.

**Compute gyration ID does not exist for compute gyration/shape** Self-explanatory. Provide a valid compute ID.

**Compute gyration/shape compute ID does not point to a gyration compute** Self-explanatory. Provide and ID of a compute gyration command.

**Compute ID for compute reduce does not exist** Self-explanatory.

**Compute ID for compute slice does not exist** Self-explanatory.

**Compute ID for fix ave/atom does not exist** Self-explanatory.

**Compute ID for fix ave/chunk does not exist** Self-explanatory.

**Compute ID for fix ave/correlate does not exist** Self-explanatory.

**Compute ID for fix ave/histo does not exist** Self-explanatory.

**Compute ID for fix ave/time does not exist** Self-explanatory.

**Compute ID for fix numdiff does not exist** Self-explanatory.

**Compute ID for fix store/state does not exist** Self-explanatory.

**Compute ID for fix vector does not exist** Self-explanatory.

**Compute ID must be alphanumeric or underscore characters** Self-explanatory.

**Compute angle/local used when angles are not allowed** The atom style does not support angles.

**Compute angmom/chunk does not use chunk/atom compute** The style of the specified compute is not chunk/atom.

**Compute body/local requires atom style body** Self-explanatory.

**Compute bond/local used when bonds are not allowed** The atom style does not support bonds.

**Compute centro/atom requires a pair style to be defined** This is because the computation of the centro-symmetry values uses a pairwise neighbor list.

**Compute chunk/atom bin/cylinder radius is too large for periodic box** Radius cannot be bigger than 1/2 of a non-axis periodic dimension.

**Compute chunk/atom bin/sphere radius is too large for periodic box** Radius cannot be bigger than 1/2 of any periodic dimension.

**Compute chunk/atom compute array is accessed out-of-range** The index for the array is out of bounds.

**Compute chunk/atom compute does not calculate a per-atom array** Self-explanatory.
Compute chunk/atom compute does not calculate a per-atom vector Self-explanatory.
Compute chunk/atom compute does not calculate per-atom values Self-explanatory.
Compute chunk/atom cylinder axis must be z for 2d Self-explanatory.
Compute chunk/atom fix array is accessed out-of-range the index for the array is out of bounds.
Compute chunk/atom fix does not calculate a per-atom array Self-explanatory.
Compute chunk/atom fix does not calculate a per-atom vector Self-explanatory.
Compute chunk/atom fix does not calculate per-atom values Self-explanatory.
Compute chunk/atom for triclinic boxes requires units reduced Self-explanatory.
Compute chunk/atom ids once but nchunk is not once You cannot assign chunks IDs to atom permanently if the number of chunks may change.
Compute chunk/atom molecule for non-molecular system Self-explanatory.
Compute chunk/atom sphere z origin must be 0.0 for 2d Self-explanatory.
Compute chunk/atom stores no IDs for compute property/chunk It will only store IDs if its compress option is enabled.
Compute chunk/atom stores no coord1 for compute property/chunk Only certain binning options for compute chunk/atom store coordinates.
Compute chunk/atom stores no coord2 for compute property/chunk Only certain binning options for compute chunk/atom store coordinates.
Compute chunk/atom stores no coord3 for compute property/chunk Only certain binning options for compute chunk/atom store coordinates.
Compute chunk/atom variable is not atom-style variable Self-explanatory.
Compute chunk/atom without bins cannot use discard mixed That discard option only applies to the binning styles.
Compute cluster/atom cutoff is longer than pairwise cutoff Cannot identify clusters beyond cutoff.
Compute cluster/atom requires a pair style be defined This is so that the pair style defines a cutoff distance which is used to find clusters.
Compute cna/atom cutoff is longer than pairwise cutoff Self-explanatory.
Compute cna/atom requires a pair style be defined Self-explanatory.
Compute com/chunk does not use chunk/atom compute The style of the specified compute is not chunk/atom.
Compute contact/atom requires a pair style be defined Self-explanatory.
Compute contact/atom requires atom style sphere Self-explanatory.
Compute coord/atom cutoff is longer than pairwise cutoff Cannot compute coordination at distances longer than the pair cutoff, since those atoms are not in the neighbor list.
Compute coord/atom requires a pair style be defined Self-explanatory.
Compute damage/atom requires peridynamic potential Damage is a Peridynamic-specific metric. It requires you to be running a Peridynamics simulation.
Compute dihedral/local used when dihedrals are not allowed The atom style does not support dihedrals.
Compute dilatation/atom cannot be used with this pair style Self-explanatory.
Compute dilatation/atom requires Peridynamic pair style Self-explanatory.
Compute does not allow an extra compute or fix to be reset This is an internal LAMMPS error. Please report it to the developers.

Compute erotate/asphere requires atom style ellipsoid or line or tri Self-explanatory.

Compute erotate/asphere requires extended particles This compute cannot be used with point particles.

Compute erotate/rigid with non-rigid fix-ID Self-explanatory.

Compute erotate/sphere requires atom style sphere Self-explanatory.

Compute erotate/sphere/atom requires atom style sphere Self-explanatory.

Compute event/displace has invalid fix event assigned This is an internal LAMMPS error. Please report it to the developers.

Compute group/group group ID does not exist Self-explanatory.

Compute gyration/chunk does not use chunk/atom compute The style of the specified compute is not chunk/atom.

Compute heat/flux compute ID does not compute ke/atom Self-explanatory.

Compute heat/flux compute ID does not compute pe/atom Self-explanatory.

Compute heat/flux compute ID does not compute stress/atom Self-explanatory.

Compute hexorder/atom cutoff is longer than pairwise cutoff Cannot compute order parameter beyond cutoff.

Compute hexorder/atom requires a pair style be defined Self-explanatory.

Compute improper/local used when impropers are not allowed The atom style does not support impropers.

Compute inertia/chunk does not use chunk/atom compute The style of the specified compute is not chunk/atom.

Compute ke/rigid with non-rigid fix-ID Self-explanatory.

Compute msd/chunk does not use chunk/atom compute The style of the specified compute is not chunk/atom.

Compute msd/chunk nchunk is not static This is required because the MSD cannot be computed consistently if the number of chunks is changing. Compute chunk/atom allows setting nchunk to be static.

Compute nve/asphere requires atom style ellipsoid Self-explanatory.

Compute nvt/nph/npt asphere requires atom style ellipsoid Self-explanatory.

Compute nvt/nph/npt body requires atom style body Self-explanatory.

Compute omega/chunk does not use chunk/atom compute The style of the specified compute is not chunk/atom.

Compute orientorder/atom cutoff is longer than pairwise cutoff Cannot compute order parameter beyond cutoff.

Compute orientorder/atom requires a pair style be defined Self-explanatory.

Compute pair must use group all Pair styles accumulate energy on all atoms.

Compute pe must use group all Energies computed by potentials (pair, bond, etc) are computed on all atoms.

Compute plasticity/atom cannot be used with this pair style Self-explanatory.

Compute plasticity/atom requires Peridynamic pair style Self-explanatory.

Compute pressure must use group all Virial contributions computed by potentials (pair, bond, etc) are computed on all atoms.

Compute pressure requires temperature ID to include kinetic energy The keflag cannot be used unless a temperature compute is provided.

Compute pressure temperature ID does not compute temperature The compute ID assigned to a pressure computation must compute temperature.
Compute property/atom floating point vector does not exist  The command is accessing a vector added by the fix property/atom command, that does not exist.

Compute property/atom for atom property that is not allocated  Self-explanatory.

Compute property/atom integer vector does not exist  The command is accessing a vector added by the fix property/atom command, that does not exist.

Compute property/chunk does not use chunk/atom compute  The style of the specified compute is not chunk/atom.

Compute property/local cannot use these inputs together  Only inputs that generate the same number of datums can be used together. E.g. bond and angle quantities cannot be mixed.

Compute property/local does not (yet) work with atom_style template  Self-explanatory.

Compute property/local for property that is not allocated  Self-explanatory.

Compute rdf requires a pair style be defined  Self-explanatory.

Compute reduce compute array is accessed out-of-range  An index for the array is out of bounds.

Compute reduce compute calculates global values  A compute that calculates peratom or local values is required.

Compute reduce compute does not calculate a local array  Self-explanatory.

Compute reduce compute does not calculate a local vector  Self-explanatory.

Compute reduce compute does not calculate a per-atom array  Self-explanatory.

Compute reduce compute does not calculate a per-atom vector  Self-explanatory.

Compute reduce fix array is accessed out-of-range  An index for the array is out of bounds.

Compute reduce fix calculates global values  A fix that calculates peratom or local values is required.

Compute reduce fix does not calculate a local array  Self-explanatory.

Compute reduce fix does not calculate a local vector  Self-explanatory.

Compute reduce fix does not calculate a per-atom array  Self-explanatory.

Compute reduce fix does not calculate a per-atom vector  Self-explanatory.

Compute reduce replace requires min or max mode  Self-explanatory.

Compute reduce variable is not atom-style variable  Self-explanatory.

Compute slice compute array is accessed out-of-range  An index for the array is out of bounds.

Compute slice compute does not calculate a global array  Self-explanatory.

Compute slice compute does not calculate a global vector  Self-explanatory.

Compute slice compute does not calculate global vector or array  Self-explanatory.

Compute slice compute vector is accessed out-of-range  The index for the vector is out of bounds.

Compute slice fix array is accessed out-of-range  An index for the array is out of bounds.

Compute slice fix does not calculate a global array  Self-explanatory.

Compute slice fix does not calculate a global vector  Self-explanatory.

Compute slice fix does not calculate global vector or array  Self-explanatory.

Compute slice fix vector is accessed out-of-range  The index for the vector is out of bounds.

Compute sna/atom cutoff is longer than pairwise cutoff  Self-explanatory.

Compute sna/atom requires a pair style be defined  Self-explanatory.
Compute snad/atom cutoff is longer than pairwise cutoff  Self-explanatory.
Compute snad/atom requires a pair style be defined  Self-explanatory.
Compute snav/atom cutoff is longer than pairwise cutoff  Self-explanatory.
Compute snav/atom requires a pair style be defined  Self-explanatory.
Compute stress/atom temperature ID does not compute temperature  The specified compute must compute temperature.
Compute temp/asphere requires atom style ellipsoid  Self-explanatory.
Compute temp/asphere requires extended particles  This compute cannot be used with point particles.
Compute temp/body requires atom style body  Self-explanatory.
Compute temp/bodies requires bodies  This compute can only be applied to body particles.
Compute temp/chunk does not use chunk/atom compute  The style of the specified compute is not chunk/atom.
Compute temp/cs requires ghost atoms store velocity  Use the comm_modify vel yes command to enable this.
Compute temp/cs used when bonds are not allowed  This compute only works on pairs of bonded particles.
Compute temp/partial cannot use vz for 2d systemsx  Self-explanatory.
Compute temp/profile cannot bin z for 2d systemsx  Self-explanatory.
Compute temp/profile cannot use vz for 2d systemsx  Self-explanatory.
Compute temp/sphere requires atom style sphere  Self-explanatory.
Compute ti kspace style does not exist  Self-explanatory.
Compute ti pair style does not exist  Self-explanatory.
Compute ti tail when pair style does not compute tail corrections  Self-explanatory.
Compute torque/chunk does not use chunk/atom compute  The style of the specified compute is not chunk/atom.
Compute used in dump between runs is not current  The compute was not invoked on the current timestep, therefore it cannot be used in a dump between runs.
Compute used in variable between runs is not current  Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the doc page for the variable command for more info.
Compute used in variable thermo keyword between runs is not current  Some thermo keywords rely on a compute to calculate their value(s). Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the doc page for the variable command for more info.
Compute vcm/chunk does not use chunk/atom compute  The style of the specified compute is not chunk/atom.
Computed temperature for fix temp/berendsen cannot be 0.0  Self-explanatory.
Computed temperature for fix temp/rescale cannot be 0.0  Cannot rescale the temperature to a new value if the current temperature is 0.0.
Core/shell partner atom not found  Could not find one of the atoms in the bond pair.
Core/shell partners were not all found  Could not find or more atoms in the bond pairs.
Could not adjust g_ewald_6  The Newton-Raphson solver failed to converge to a good value for g_ewald. This error should not occur for typical problems. Please send an email to the developers.
**Could not compute g_ewald** The Newton-Raphson solver failed to converge to a good value for g_ewald. This error should not occur for typical problems. Please send an email to the developers.

**Could not compute grid size** The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

**Could not compute grid size for Coulomb interaction** The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

**Could not compute grid size for Dispersion** The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

**Could not compute 3d FFT plan** The FFT setup for the PPPM solver failed, typically due to lack of memory. This is an unusual error. Check the size of the FFT grid you are requesting.

**Could not create 3d grid of processors** The specified constraints did not allow a Px by Py by Pz grid to be created where Px * Py * Pz = P = total number of processors.

**Could not create 3d remap plan** The FFT setup in ppm failed.

**Could not create Python function arguments** This is an internal Python error, possibly because the number of inputs to the function is too large.

**Could not create numa grid of processors** The specified constraints did not allow this style of grid to be created. Usually this is because the total processor count is not a multiple of the cores/node or the user specified processor count is > 1 in one of the dimensions.

**Could not create twolevel 3d grid of processors** The specified constraints did not allow this style of grid to be created.

**Could not evaluate Python function input variable** Self-explanatory.

**Could not find Python function** The provided Python code was run successfully, but it not define a callable function with the required name.

**Could not find atom_modify first group ID** Self-explanatory.

**Could not find change_box group ID** Group ID used in the change_box command does not exist.

**Could not find compute ID for PRD** Self-explanatory.

**Could not find compute ID for TAD** Self-explanatory.

**Could not find compute ID for temperature bias** Self-explanatory.

**Could not find compute ID to delete** Self-explanatory.

**Could not find compute displac/atom fix ID** Self-explanatory.

**Could not find compute event/displace fix ID** Self-explanatory.

**Could not find compute group ID** Self-explanatory.

**Could not find compute heat/flux comput ID** Self-explanatory.

**Could not find compute msd fix ID** Self-explanatory.

**Could not find compute msd/chunk fix ID** The compute creates an internal fix, which has been deleted.

**Could not find compute pressure temperature ID** The compute ID for calculating temperature does not exist.

**Could not find compute stress/atom temperature ID** Self-explanatory.

**Could not find compute vacf fix ID** Self-explanatory.

**Could not find compute/voronoi surface group ID** Self-explanatory.

**Could not find compute_modify ID** Self-explanatory.
Could not find custom per-atom property ID  Self-explanatory.

Could not find delete_atoms group ID  Group ID used in the delete_atoms command does not exist.

Could not find delete_atoms region ID  Region ID used in the delete_atoms command does not exist.

Could not find displace_atoms group ID  Group ID used in the displace_atoms command does not exist.

Could not find dump custom compute ID  Self-explanatory.

Could not find dump custom fix ID  Self-explanatory.

Could not find dump custom variable name  Self-explanatory.

Could not find dump group ID  A group ID used in the dump command does not exist.

Could not find dump local compute ID  Self-explanatory.

Could not find dump local fix ID  Self-explanatory.

Could not find dump modify compute ID  Self-explanatory.

Could not find dump modify custom atom floating point property ID  Self-explanatory.

Could not find dump modify custom atom integer property ID  Self-explanatory.

Could not find dump modify fix ID  Self-explanatory.

Could not find dump modify variable name  Self-explanatory.

Could not find fix ID to delete  Self-explanatory.

Could not find fix adapt storage fix ID  This should not happen unless you explicitly deleted a secondary fix that fix adap created internally.

Could not find fix halt variable name  Self-explanatory.

Could not find fix gcmc exclusion group ID  Self-explanatory.

Could not find fix gcmc rotation group ID  Self-explanatory.

Could not find fix group ID  A group ID used in the fix command does not exist.

Could not find fix msst compute ID  Self-explanatory.

Could not find fix poems group ID  A group ID used in the fix poems command does not exist.

Could not find fix recenter group ID  A group ID used in the fix recenter command does not exist.

Could not find fix rigid group ID  A group ID used in the fix rigid command does not exist.

Could not find fix srd group ID  Self-explanatory.

Could not find fix_modify ID  A fix ID used in the fix_modify command does not exist.

Could not find fix_modify pressure ID  The compute ID for computing pressure does not exist.

Could not find fix_modify temperature ID  The compute ID for computing temperature does not exist.

Could not find group clear group ID  Self-explanatory.

Could not find group delete group ID  Self-explanatory.

Could not find pair fix ID  A fix is created internally by the pair style to store shear history information. You cannot delete it.

Could not find set group ID  Group ID specified in set command does not exist.

Could not find specified fix gcmc group ID  Self-explanatory.

Could not find thermo compute ID  Compute ID specified in thermo_style command does not exist.
Could not find thermo_custom compute ID  The compute ID needed by thermo style custom to compute a requested quantity does not exist.

Could not find thermo_custom fix ID  The fix ID needed by thermo style custom to compute a requested quantity does not exist.

Could not find thermo_custom variable name  Self-explanatory.

Could not find thermo fix ID  Fix ID specified in thermo_style command does not exist.

Could not find thermo variable name  Self-explanatory.

Could not find thermo_modify pressure ID  The compute ID needed by thermo style custom to compute pressure does not exist.

Could not find thermo_modify temperature ID  The compute ID needed by thermo style custom to compute temperature does not exist.

Could not find undump ID  A dump ID used in the undump command does not exist.

Could not find velocity group ID  A group ID used in the velocity command does not exist.

Could not find velocity temperature ID  The compute ID needed by the velocity command to compute temperature does not exist.

Could not find initialize a specified accelerator device  Could not initialize at least one of the devices specified for the gpu package.

Could not grab element entry from EIM potential file  Self-explanatory.

Could not grab global entry from EIM potential file  Self-explanatory.

Could not grab pair entry from EIM potential file  Self-explanatory.

Could not initialize embedded Python  The main module in Python was not accessible.

Could not open Python file  The specified file of Python code cannot be opened. Check that the path and name are correct.

Could not process Python file  The Python code in the specified file was not run successfully by Python, probably due to errors in the Python code.

Could not process Python string  The Python code in the here string was not run successfully by Python, probably due to errors in the Python code.

Coulomb PPPMDisp order has been reduced below minorder  The default minimum order is 2. This can be reset by the kspace_modify minorder command.

Coulombic cutoff not supported in pair_style buck/long/coul/coul  Must use long-range Coulombic interactions.

Coulombic cutoff not supported in pair_style lj/long/coul/long  Must use long-range Coulombic interactions.

Coulombic cutoff not supported in pair_style lj/long/tip4p/long  Must use long-range Coulombic interactions.

Coulombic cutoffs of pair hybrid sub-styles do not match  If using a Kspace solver, all Coulombic cutoffs of long pair styles must be the same.

Coulombic cut not supported in pair_style lj/long/dipole/long  Must use long-range Coulombic interactions.

Could not find dump_modify ID  Self-explanatory.

Create_atoms command before simulation box is defined  The create_atoms command cannot be used before a read_data, read_restart, or create_box command.

Create_atoms molecule has atom IDs, but system does not  The atom_style id command can be used to force atom IDs to be stored.
Create_atoms molecule must have atom types  The defined molecule does not specify atom types.
Create_atoms molecule must have coordinates  The defined molecule does not specify coordinates.
Create_atoms region ID does not exist  A region ID used in the create_atoms command does not exist.
Create_bonds command before simulation box is defined  Self-explanatory.
Create_bonds command requires no kspace_style be defined  This is so that atom pairs that are already bonded to not appear in the neighbor list.
Create_bonds command requires special_bonds 1-2 weights be 0.0  This is so that atom pairs that are already bonded to not appear in the neighbor list.
Create_bonds max distance > neighbor cutoff  Can only create bonds for atom pairs that will be in neighbor list.
Create_bonds requires a pair style be defined  Self-explanatory.
Create_box region ID does not exist  Self-explanatory.
Create_box region does not support a bounding box  Not all regions represent bounded volumes. You cannot use such a region with the create_box command.
Custom floating point vector for fix store/state does not exist  The command is accessing a vector added by the fix property/atom command, that does not exist.
Custom integer vector for fix store/state does not exist  The command is accessing a vector added by the fix property/atom command, that does not exist.
Custom per-atom property ID is not floating point  Self-explanatory.
Custom per-atom property ID is not integer  Self-explanatory.
Cut-offs missing in pair_style lj/long/dipole/long  Self-explanatory.
Cutoffs missing in pair_style buck/long/coul/long  Self-explanatory.
Cutoffs missing in pair_style lj/long/coul/long  Self-explanatory.
Cyclic loop in joint connections  Fix poems cannot (yet) work with coupled bodies whose joints connect the bodies in a ring (or cycle).
Degenerate lattice primitive vectors  Invalid set of 3 lattice vectors for lattice command.
Delete region ID does not exist  Self-explanatory.
Delete_atoms command before simulation box is defined  The delete_atoms command cannot be used before a read_data, read_restart, or create_box command.
Delete_atoms cutoff > max neighbor cutoff  Can only delete atoms in atom pairs that will be in neighbor list.
Delete_atoms mol yes requires atom attribute molecule  Cannot use this option with a non-molecular system.
Delete_atoms requires a pair style be defined  This is because atom deletion within a cutoff uses a pairwise neighbor list.
Delete_bonds command before simulation box is defined  The delete_bonds command cannot be used before a read_data, read_restart, or create_box command.
Delete_bonds command with no atoms existing  No atoms are yet defined so the delete_bonds command cannot be used.
Deposition region extends outside simulation box  Self-explanatory.
Did not assign all atoms correctly  Atoms read in from a data file were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box.
Did not assign all restart atoms correctly Atoms read in from the restart file were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box. Normally this should not happen. You may wish to use the “remap” option on the read_restart command to see if this helps.

Did not find all elements in MEAM library file Some requested elements were not found in the MEAM file. Check spelling etc.

Did not find fix shake partner info Could not find bond partners implied by fix shake command. This error can be triggered if the delete_bonds command was used before fix shake, and it removed bonds without resetting the 1-2, 1-3, 1-4 weighting list via the special keyword.

Did not find keyword in table file Keyword used in pair_coeff command was not found in table file.

Did not set pressure for fix rigid/nph The press keyword must be specified.

Did not set temp for fix rigid/nvt/small Self-explanatory.

Did not set temp or press for fix rigid/npt/small Self-explanatory.

Did not set temperature for fix rigid/nvt The temp keyword must be specified.

Did not set temperature or pressure for fix rigid/npt The temp and press keywords must be specified.

Dihedral atom missing in delete_bonds The delete_bonds command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

Dihedral atom missing in set command The set command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

Dihedral atoms %d %d %d %d missing on proc %d at step %ld One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

Dihedral atoms missing on proc %d at step %ld One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

Dihedral charmm is incompatible with Pair style Dihedral style charmm must be used with a pair style charmm in order for the 1-4 epsilon/sigma parameters to be defined.

Dihedral coeff for hybrid has invalid style Dihedral style hybrid uses another dihedral style as one of its coefficients. The dihedral style used in the dihedral_coeff command or read from a restart file is not recognized.

Dihedral coeffs are not set No dihedral coefficients have been assigned in the data file or via the dihedral_coeff command.

Dihedral style hybrid cannot have hybrid as an argument Self-explanatory.

Dihedral style hybrid cannot have none as an argument Self-explanatory.

Dihedral style hybrid cannot use same dihedral style twice Self-explanatory.

Dihedral/improper extent > half of periodic box length This error was detected by the neigh_modify check yes setting. It is an error because the dihedral atoms are so far apart it is ambiguous how it should be defined.

Dihedral_coeff command before dihedral style is defined Coefficients cannot be set in the data file or via the dihedral_coeff command until an dihedral_style has been assigned.

Dihedral_coeff command before simulation box is defined The dihedral_coeff command cannot be used before a read_data, read_restart, or create_box command.

Dihedral_coeff command when no dihedrals allowed The chosen atom style does not allow for dihedrals to be defined.
Dihedral_style command when no dihedrals allowed  The chosen atom style does not allow for dihedrals to be defined.

Dihedrals assigned incorrectly  Dihedrals read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Dihedrals defined but no dihedral types  The data file header lists dihedrals but no dihedral types.

Dimension command after simulation box is defined  The dimension command cannot be used after a read_data, read_restart, or create_box command.

Disk limit not supported by OS or illegal path  Self-explanatory.

Dispersion PPPMDisp order has been reduced below minorder  The default minimum order is 2. This can be reset by the kspace_modify minorder command.

Displace_atoms command before simulation box is defined  The displace_atoms command cannot be used before a read_data, read_restart, or create_box command.

Distance must be > 0 for compute event/displace  Self-explanatory.

Divide by 0 in influence function  This should not normally occur. It is likely a problem with your model.

Divide by 0 in influence function of pair peri/lps  This should not normally occur. It is likely a problem with your model.

Divide by 0 in variable formula  Self-explanatory.

Domain too large for neighbor bins  The domain has become extremely large so that neighbor bins cannot be used. Most likely, one or more atoms have been blown out of the simulation box to a great distance.

Double precision is not supported on this accelerator  Self-explanatory.

Dump atom/gz only writes compressed files  The dump atom/gz output file name must have a .gz suffix.

Dump cfg arguments can not mix xsylx with xsylxsu  Self-explanatory.

Dump cfg arguments must start with ‘mass type xs ys zs’ or ‘mass type xsu ysu zsu’  This is a requirement of the CFG output format. See the dump cfg doc page for more details.

Dump cfg requires one snapshot per file  Use the wildcard “*” character in the filename.

Dump cfg/gz only writes compressed files  The dump cfg/gz output file name must have a .gz suffix.

Dump custom and fix not computed at compatible times  The fix must produce per-atom quantities on timesteps that dump custom needs them.

Dump custom compute does not calculate per-atom array  Self-explanatory.

Dump custom compute does not calculate per-atom vector  Self-explanatory.

Dump custom compute does not compute per-atom info  Self-explanatory.

Dump custom compute vector is accessed out-of-range  Self-explanatory.

Dump custom fix does not compute per-atom array  Self-explanatory.

Dump custom fix does not compute per-atom info  Self-explanatory.

Dump custom fix vector is accessed out-of-range  Self-explanatory.

Dump custom variable is not atom-style variable  Only atom-style variables generate per-atom quantities, needed for dump output.

Dump custom/gz only writes compressed files  The dump custom/gz output file name must have a .gz suffix.
Dump dcd of non-matching # of atoms  Every snapshot written by dump dcd must contain the same # of atoms.

Dump dcd requires sorting by atom ID  Use the dump_modify sort command to enable this.

Dump every variable returned a bad timestep  The variable must return a timestep greater than the current timestep.

Dump file MPI-IO output not allowed with % in filename  This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

Dump file does not contain requested snapshot  Self-explanatory.

Dump file is incorrectly formatted  Self-explanatory.

Dump image body yes requires atom style body  Self-explanatory.

Dump image bond not allowed with no bond types  Self-explanatory.

Dump image cannot perform sorting  Self-explanatory.

Dump image line requires atom style line  Self-explanatory.

Dump image persp option is not yet supported  Self-explanatory.

Dump image requires one snapshot per file  Use a “*” in the filename.

Dump image tri requires atom style tri  Self-explanatory.

Dump local and fix not computed at compatible times  The fix must produce per-atom quantities on timesteps that dump local needs them.

Dump local attributes contain no compute or fix  Self-explanatory.

Dump local cannot sort by atom ID  This is because dump local does not really dump per-atom info.

Dump local compute does not calculate local array  Self-explanatory.

Dump local compute does not calculate local vector  Self-explanatory.

Dump local compute does not compute local info  Self-explanatory.

Dump local compute vector is accessed out-of-range  Self-explanatory.

Dump local count is not consistent across input fields  Every column of output must be the same length.

Dump local fix does not compute local array  Self-explanatory.

Dump local fix does not compute local info  Self-explanatory.

Dump local fix does not compute local vector  Self-explanatory.

Dump local fix vector is accessed out-of-range  Self-explanatory.

Dump modify bcolor not allowed with no bond types  Self-explanatory.

Dump modify bdiam not allowed with no bond types  Self-explanatory.

Dump modify compute ID does not compute per-atom array  Self-explanatory.

Dump modify compute ID does not compute per-atom info  Self-explanatory.

Dump modify compute ID does not compute per-atom vector  Self-explanatory.

Dump modify compute ID vector is not large enough  Self-explanatory.

Dump modify element names do not match atom types  Number of element names must equal number of atom types.

Dump modify fix ID does not compute per-atom array  Self-explanatory.

Dump modify fix ID does not compute per-atom info  Self-explanatory.

Dump modify fix ID does not compute per-atom vector  Self-explanatory.
Dump modify fix ID vector is not large enough  Self-explanatory.
Dump modify variable is not atom-style variable  Self-explanatory.
Dump sort column is invalid  Self-explanatory.
Dump xtc requires sorting by atom ID  Use the dump_modify sort command to enable this.
Dump xyz/gz only writes compressed files  The dump xyz/gz output file name must have a .gz suffix.
Dump_modify buffer yes not allowed for this style  Self-explanatory.
Dump_modify format string is too short  There are more fields to be dumped in a line of output than your format string specifies.
Dump_modify region ID does not exist  Self-explanatory.
Dumping an atom property that is not allocated  The chosen atom style does not define the per-atom quantity being dumped.
Duplicate atom IDs exist  Self-explanatory.
Duplicate fields in read_dump command  Self-explanatory.
Duplicate particle in PeriDynamic bond - simulation box is too small  This is likely because your box length is shorter than 2 times the bond length.
Electronic temperature dropped below zero  Something has gone wrong with the fix ttm electron temperature model.
Element not defined in potential file  The specified element is not in the potential file.
Empty brackets in variable  There is no variable syntax that uses empty brackets. Check the variable doc page.
Energy was not tallied on needed timestep  You are using a thermo keyword that requires potentials to have tallied energy, but they did not on this timestep. See the variable doc page for ideas on how to make this work.
Epsilon or sigma reference not set by pair style in PPPMDisp  Self-explanatory.
Epsilon or sigma reference not set by pair style in ewald/n  The pair style is not providing the needed epsilon or sigma values.
Error in MEAM parameter file: keyword %s (further information)  Self-explanatory. Check the parameter file.
Error in vdw spline: inner radius > outer radius  A pre-tabulated spline is invalid. Likely a problem with the potential parameters.
Error writing averaged chunk data  Something in the output to the file triggered an error.
Error writing file header  Something in the output to the file triggered an error.
Error writing out correlation data  Something in the output to the file triggered an error.
Error writing out histogram data  Something in the output to the file triggered an error.
Error writing out time averaged data  Something in the output to the file triggered an error.
Failed to allocate %ld bytes for array %s  Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.
Failed to open FFmpeg pipeline to file %s  The specified file cannot be opened. Check that the path and name are correct and writable and that the FFmpeg executable can be found and run.
Failed to reallocate %ld bytes for array %s  Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.
Fewer SRD bins than processors in some dimension  This is not allowed. Make your SRD bin size smaller.
File variable could not read value  Check the file assigned to the variable.
Final box dimension due to fix deform is < 0.0  Self-explanatory.
Fix %es does not allow use of dynamic group  Dynamic groups have not yet been enabled for this fix.
Fix ID for compute chunk/atom does not exist  Self-explanatory.
Fix ID for compute erotate/rigid does not exist  Self-explanatory.
Fix ID for compute ke/rigid does not exist  Self-explanatory.
Fix ID for compute reduce does not exist  Self-explanatory.
Fix ID for compute slice does not exist  Self-explanatory.
Fix ID for fix ave/atom does not exist  Self-explanatory.
Fix ID for fix ave/chunk does not exist  Self-explanatory.
Fix ID for fix ave/correlate does not exist  Self-explanatory.
Fix ID for fix ave/histo does not exist  Self-explanatory.
Fix ID for fix ave/time does not exist  Self-explanatory.
Fix ID for fix store/state does not exist  Self-explanatory.
Fix ID for fix vector does not exist  Self-explanatory.
Fix ID for read_data does not exist  Self-explanatory.
Fix ID for velocity does not exist  Self-explanatory.
Fix ID must be alphanumeric or underscore characters  Self-explanatory.
Fix SRD: bad bin assignment for SRD advection  Something has gone wrong in your SRD model; try using more conservative settings.
Fix SRD: bad search bin assignment  Something has gone wrong in your SRD model; try using more conservative settings.
Fix SRD: bad stencil bin for big particle  Something has gone wrong in your SRD model; try using more conservative settings.
Fix SRD: too many big particles in bin  Reset the ATOMPERBIN parameter at the top of fix_srd.cpp to a larger value, and re-compile the code.
Fix SRD: too many walls in bin  This should not happen unless your system has been setup incorrectly.
Fix adapt interface to this pair style not supported  New coding for the pair style would need to be done.
Fix adapt kspace style does not exist  Self-explanatory.
Fix adapt pair style does not exist  Self-explanatory.
Fix adapt pair style param not supported  The pair style does not know about the parameter you specified.
Fix adapt requires atom attribute charge  The atom style being used does not specify an atom charge.
Fix adapt requires atom attribute diameter  The atom style being used does not specify an atom diameter.
Fix adapt type pair range is not valid for pair hybrid sub-style  Self-explanatory.
Fix append/atoms requires a lattice be defined  Use the lattice command for this purpose.
Fix ave/atom compute array is accessed out-of-range  Self-explanatory.
Fix ave/atom compute does not calculate a per-atom array  Self-explanatory.
Fix ave/atom compute does not calculate a per-atom vector  A compute used by fix ave/atom must generate per-atom values.

12.4. Error messages
Fix ave/atom compute does not calculate per-atom values A compute used by fix ave/atom must generate per-atom values.

Fix ave/atom fix array is accessed out-of-range Self-explanatory.

Fix ave/atom fix does not calculate a per-atom array Self-explanatory.

Fix ave/atom fix does not calculate a per-atom vector A fix used by fix ave/atom must generate per-atom values.

Fix ave/atom fix does not calculate per-atom values A fix used by fix ave/atom must generate per-atom values.

Fix ave/chunk compute does not calculate a per-atom array Self-explanatory.

Fix ave/chunk compute does not calculate a per-atom vector Self-explanatory.

Fix ave/chunk compute does not calculate per-atom values Self-explanatory.

Fix ave/chunk compute vector is accessed out-of-range Self-explanatory.

Fix ave/chunk does not use chunk/atom compute The specified compute is not for a compute chunk/atom command.

Fix ave/chunk fix does not calculate a per-atom array Self-explanatory.

Fix ave/chunk fix does not calculate a per-atom vector Self-explanatory.

Fix ave/chunk fix does not calculate per-atom values Self-explanatory.

Fix ave/chunk fix vector is accessed out-of-range Self-explanatory.

Fix ave/chunk variable is not atom-style variable Self-explanatory.

Fix ave/correlate compute does not calculate a scalar Self-explanatory.

Fix ave/correlate compute does not calculate a vector Self-explanatory.

Fix ave/correlate compute vector is accessed out-of-range The index for the vector is out of bounds.

Fix ave/correlate fix does not calculate a scalar Self-explanatory.

Fix ave/correlate fix does not calculate a vector Self-explanatory.

Fix ave/correlate fix vector is accessed out-of-range The index for the vector is out of bounds.

Fix ave/correlate variable is not equal-style variable Self-explanatory.

Fix ave/histo cannot input local values in scalar mode Self-explanatory.

Fix ave/histo cannot input per-atom values in scalar mode Self-explanatory.

Fix ave/histo compute array is accessed out-of-range Self-explanatory.

Fix ave/histo compute does not calculate a global array Self-explanatory.

Fix ave/histo compute does not calculate a global scalar Self-explanatory.

Fix ave/histo compute does not calculate a global vector Self-explanatory.

Fix ave/histo compute does not calculate a local array Self-explanatory.

Fix ave/histo compute does not calculate a local vector Self-explanatory.

Fix ave/histo compute does not calculate a per-atom array Self-explanatory.

Fix ave/histo compute does not calculate a per-atom vector Self-explanatory.

Fix ave/histo compute does not calculate local values Self-explanatory.

Fix ave/histo compute does not calculate per-atom values Self-explanatory.
Fix ave/histo compute vector is accessed out-of-range  Self-explanatory.
Fix ave/histo fix array is accessed out-of-range  Self-explanatory.
Fix ave/histo fix does not calculate a global array  Self-explanatory.
Fix ave/histo fix does not calculate a global scalar  Self-explanatory.
Fix ave/histo fix does not calculate a global vector  Self-explanatory.
Fix ave/histo fix does not calculate a local array  Self-explanatory.
Fix ave/histo fix does not calculate a local vector  Self-explanatory.
Fix ave/histo fix does not calculate a per-atom array  Self-explanatory.
Fix ave/histo fix does not calculate a per-atom vector  Self-explanatory.
Fix ave/histo fix does not calculate local values  Self-explanatory.
Fix ave/histo fix does not calculate per-atom values  Self-explanatory.
Fix ave/histo fix vector is accessed out-of-range  Self-explanatory.
Fix ave/histo input is invalid compute  Self-explanatory.
Fix ave/histo input is invalid fix  Self-explanatory.
Fix ave/histo input is invalid variable  Self-explanatory.
Fix ave/histo inputs are not all global, per-atom, or local  All inputs in a single fix ave/histo command must be of the same style.
Fix ave/histo/weight value and weight vector lengths do not match  Self-explanatory.
Fix ave/time cannot set output array intensive/extensive from these inputs  One of more of the vector inputs has individual elements which are flagged as intensive or extensive. Such an input cannot be flagged as all intensive/extensive when turned into an array by fix ave/time.
Fix ave/time cannot use variable with vector mode  Variables produce scalar values.
Fix ave/time columns are inconsistent lengths  Self-explanatory.
Fix ave/time compute array is accessed out-of-range  An index for the array is out of bounds.
Fix ave/time compute does not calculate a scalar  Self-explanatory.
Fix ave/time compute does not calculate a vector  Self-explanatory.
Fix ave/time compute does not calculate an array  Self-explanatory.
Fix ave/time compute vector is accessed out-of-range  The index for the vector is out of bounds.
Fix ave/time fix array cannot be variable length  Self-explanatory.
Fix ave/time fix array is accessed out-of-range  An index for the array is out of bounds.
Fix ave/time fix does not calculate a scalar  Self-explanatory.
Fix ave/time fix does not calculate a vector  Self-explanatory.
Fix ave/time fix does not calculate an array  Self-explanatory.
Fix ave/time fix vector cannot be variable length  Self-explanatory.
Fix ave/time fix vector is accessed out-of-range  The index for the vector is out of bounds.
Fix ave/time variable is not equal-style variable  Self-explanatory.
Fix balance rcb cannot be used with comm_style brick  Comm_style tiled must be used instead.
Fix balance shift string is invalid The string can only contain the characters “x”, “y”, or “z”.

Fix bond/break needs ghost atoms from further away This is because the fix needs to walk bonds to a certain distance to acquire needed info. The comm_modify cutoff command can be used to extend the communication range.

Fix bond/create angle type is invalid Self-explanatory.

Fix bond/create cutoff is longer than pairwise cutoff This is not allowed because bond creation is done using the pairwise neighbor list.

Fix bond/create dihedral type is invalid Self-explanatory.

Fix bond/create improper type is invalid Self-explanatory.

Fix bond/create induced too many angles/dihedrals/impropers per atom See the read_data command for info on using the “extra/angle/per/atom”, (or dihedral, improper) keywords to allow for additional angles, dihedrals, and imperors to be formed.

Fix bond/create needs ghost atoms from further away This is because the fix needs to walk bonds to a certain distance to acquire needed info, The comm_modify cutoff command can be used to extend the communication range.

Fix bond/swap cannot use dihedral or improper styles These styles cannot be defined when using this fix.

Fix bond/swap requires pair and bond styles Self-explanatory.

Fix bond/swap requires special_bonds = 0,1,1 Self-explanatory.

Fix box/relax generated negative box length The pressure being applied is likely too large. Try applying it incrementally, to build to the high pressure.

Fix command before simulation box is defined The fix command cannot be used before a read_data, read_restart, or create_box command.

Fix deform cannot use yz variable with xy The yz setting cannot be a variable if xy deformation is also specified. This is because LAMMPS cannot determine if the yz setting will induce a box flip which would be invalid if xy is also changing.

Fix deform is changing yz too much with xy When both yz and xy are changing, it induces changes in xz if the box must flip from one tilt extreme to another. Thus it is not allowed for yz to grow so much that a flip is induced.

Fix deform tilt factors require triclinic box Cannot deform the tilt factors of a simulation box unless it is a triclinic (non-orthogonal) box.

Fix deform volume setting is invalid Cannot use volume style unless other dimensions are being controlled.

Fix deposit and fix rigid/small not using same molecule template ID Self-explanatory.

Fix deposit and fix shake not using same molecule template ID Self-explanatory.

Fix deposit molecule must have atom types The defined molecule does not specify atom types.

Fix deposit molecule must have coordinates The defined molecule does not specify coordinates.

Fix deposit molecule template ID must be same as atom_style template ID When using atom_style template, you cannot deposit molecules that are not in that template.

Fix deposit region cannot be dynamic Only static regions can be used with fix deposit.

Fix deposit region does not support a bounding box Not all regions represent bounded volumes. You cannot use such a region with the fix deposit command.

Fix deposit shake fix does not exist Self-explanatory.

Fix efield requires atom attribute q or mu The atom style defined does not have this attribute.
**Fix efield with dipoles cannot use atom-style variables**  This option is not supported.

**Fix evaporate molecule requires atom attribute molecule**  The atom style being used does not define a molecule ID.

**Fix external callback function not set**  This must be done by an external program in order to use this fix.

**Fix for fix ave/atom not computed at compatible time**  Fixes generate their values on specific timesteps. Fix ave/atom is requesting a value on a non-allowed timestep.

**Fix for fix ave/chunk not computed at compatible time**  Fixes generate their values on specific timesteps. Fix ave/chunk is requesting a value on a non-allowed timestep.

**Fix for fix ave/correlate not computed at compatible time**  Fixes generate their values on specific timesteps. Fix ave/correlate is requesting a value on a non-allowed timestep.

**Fix for fix ave/histo not computed at compatible time**  Fixes generate their values on specific timesteps. Fix ave/histo is requesting a value on a non-allowed timestep.

**Fix for fix ave/spatial not computed at compatible time**  Fixes generate their values on specific timesteps. Fix ave/spatial is requesting a value on a non-allowed timestep.

**Fix for fix ave/time not computed at compatible time**  Fixes generate their values on specific timesteps. Fix ave/time is requesting a value on a non-allowed timestep.

**Fix for fix store/state not computed at compatible time**  Fixes generate their values on specific timesteps. Fix store/state is requesting a value on a non-allowed timestep.

**Fix freeze requires atom attribute torque**  The atom style defined does not have this attribute.

**Fix gcmc and fix shake not using same molecule template ID**  Self-explanatory.

**Fix gcmc atom has charge, but atom style does not**  Self-explanatory.

**Fix gcmc cannot exchange individual atoms belonging to a molecule**  This is an error since you should not delete only one atom of a molecule. The user has specified atomic (non-molecular) gas exchanges, but an atom belonging to a molecule could be deleted.

**Fix gcmc does not (yet) work with atom_style template**  Self-explanatory.

**Fix gcmc molecule command requires that atoms have molecule attributes**  Should not choose the gcmc molecule feature if no molecules are being simulated. The general molecule flag is off, but gcmc’s molecule flag is on.

**Fix gcmc molecule has charges, but atom style does not**  Self-explanatory.

**Fix gcmc molecule must have atom types**  The defined molecule does not specify atom types.

**Fix gcmc molecule must have coordinates**  The defined molecule does not specify coordinates.

**Fix gcmc molecule template ID must be same as atom_style template ID**  When using atom_style template, you cannot insert molecules that are not in that template.

**Fix gcmc put atom outside box**  This should not normally happen. Contact the developers.

**Fix gcmc ran out of available atom IDs**  See the setting for tagint in the src/lmptype.h file.

**Fix gcmc ran out of available molecule IDs**  See the setting for tagint in the src/lmptype.h file.

**Fix gcmc region cannot be dynamic**  Only static regions can be used with fix gcmc.

**Fix gcmc region does not support a bounding box**  Not all regions represent bounded volumes. You cannot use such a region with the fix gcmc command.

**Fix gcmc region extends outside simulation box**  Self-explanatory.
Fix gcmc shake fix does not exist  Self-explanatory.
Fix gld c coefficients must be >= 0  Self-explanatory.
Fix gld needs more prony series coefficients  Self-explanatory.
Fix gld prony terms must be > 0  Self-explanatory.
Fix gld series type must be pprony for now  Self-explanatory.
Fix gld start temperature must be >= 0  Self-explanatory.
Fix gld stop temperature must be >= 0  Self-explanatory.
Fix gld tau coefficients must be > 0  Self-explanatory.
Fix halt variable is not equal-style variable  Self-explanatory.
Fix heat group has no atoms  Self-explanatory.
Fix heat kinetic energy of an atom went negative  This will cause the velocity rescaling about to be performed by fix heat to be invalid.
Fix heat kinetic energy went negative  This will cause the velocity rescaling about to be performed by fix heat to be invalid.
Fix in variable not computed at compatible time  Fixes generate their values on specific timesteps. The variable is requesting the values on a non-allowed timestep.
Fix langevin angmom is not yet implemented with kokkos  This option is not yet available.
Fix langevin angmom requires atom style ellipsoid  Self-explanatory.
Fix langevin angmom requires extended particles  This fix option cannot be used with point particles.
Fix langevin gif and respa are not compatible  Self-explanatory.
Fix langevin gif cannot have period equal to dt/2  If the period is equal to dt/2 then division by zero will happen.
Fix langevin gif should come before fix nve  Self-explanatory.
Fix langevin gif with tbias is not yet implemented with kokkos  This option is not yet available.
Fix langevin omega is not yet implemented with kokkos  This option is not yet available.
Fix langevin omega requires atom style sphere  Self-explanatory.
Fix langevin omega requires extended particles  One of the particles has radius 0.0.
Fix langevin period must be > 0.0  The time window for temperature relaxation must be > 0
Fix langevin variable returned negative temperature  Self-explanatory.
Fix momentum group has no atoms  Self-explanatory.
Fix move cannot define z or vz variable for 2d problem  Self-explanatory.
Fix move cannot rotate aroung non z-axis for 2d problem  Self-explanatory.
Fix move cannot set linear z motion for 2d problem  Self-explanatory.
Fix move cannot set wiggle z motion for 2d problem  Self-explanatory.
Fix msst compute ID does not compute potential energy  Self-explanatory.
Fix msst compute ID does not compute pressure  Self-explanatory.
Fix msst compute ID does not compute temperature  Self-explanatory.
Fix msst requires a periodic box  Self-explanatory.
Fix msst tscale must satisfy $0 \leq tscale < 1$ Self-explanatory.

Fix npt/nph has tilted box too far in one step - periodic cell is too far from equilibrium state Self-explanatory. The change in the box tilt is too extreme on a short timescale.

Fix numdiff requires an atom map, see atom_modify Self-explanatory. Efficient loop over all atoms for numerical difference requires an atom map.

Fix numdiff requires consecutive atom IDs Self-explanatory. Efficient loop over all atoms for numerical difference requires consecutive atom IDs.

Fix nve/asphere requires extended particles This fix can only be used for particles with a shape setting.

Fix nve/asphere/noforce requires atom style ellipsoid Self-explanatory.

Fix nve/asphere/noforce requires extended particles One of the particles is not an ellipsoid.

Fix nve/body requires atom style body Self-explanatory.

Fix nve/body requires bodies This fix can only be used for particles that are bodies.

Fix nve/line can only be used for 2d simulations Self-explanatory.

Fix nve/line requires atom style line Self-explanatory.

Fix nve/line requires line particles Self-explanatory.

Fix nve/sphere dipole requires atom attribute mu An atom style with this attribute is needed.

Fix nve/sphere requires atom style sphere Self-explanatory.

Fix nve/sphere requires extended particles This fix can only be used for particles of a finite size.

Fix nve/tri can only be used for 3d simulations Self-explanatory.

Fix nve/tri requires atom style tri Self-explanatory.

Fix nve/tri requires tri particles Self-explanatory.

Fix nvt/nph/npt asphere requires extended particles The shape setting for a particle in the fix group has shape = 0.0, which means it is a point particle.

Fix nvt/nph/npt body requires bodies Self-explanatory.

Fix nvt/nph/npt sphere requires atom style sphere Self-explanatory.

Fix nvt/npt/nph damping parameters must be > 0.0 Self-explanatory.

Fix nvt/npt/nph dilate group ID does not exist Self-explanatory.

Fix nvt/sphere requires extended particles This fix can only be used for particles of a finite size.

Fix orient/fcc file open failed The fix orient/fcc command could not open a specified file.

Fix orient/fcc file read failed The fix orient/fcc command could not read the needed parameters from a specified file.

Fix orient/fcc found self twice The neighbor lists used by fix orient/fcc are messed up. If this error occurs, it is likely a bug, so send an email to the developers.

Fix peri neigh does not exist Somehow a fix that the pair style defines has been deleted.

Fix pour and fix rigid/small not using same molecule template ID Self-explanatory.

Fix pour and fix shake not using same molecule template ID Self-explanatory.

Fix pour insertion count per timestep is 0 Self-explanatory.

Fix pour molecule must have atom types The defined molecule does not specify atom types.

Fix pour molecule must have coordinates The defined molecule does not specify coordinates.
Fix pour molecule template ID must be same as atom style template ID When using atom style template, you cannot pour molecules that are not in that template.

Fix pour polydisperse fractions do not sum to 1.0 Self-explanatory.

Fix pour region ID does not exist Self-explanatory.

Fix pour region cannot be dynamic Only static regions can be used with fix pour.

Fix pour region does not support a bounding box Not all regions represent bounded volumes. You cannot use such a region with the fix pour command.

Fix pour requires atom attributes radius, rmass The atom style defined does not have these attributes.

Fix pour rigid fix does not exist Self-explanatory.

Fix pour shake fix does not exist Self-explanatory.

Fix press/berendsen damping parameters must be > 0.0 Self-explanatory.

Fix property/atom cannot specify mol twice Self-explanatory.

Fix property/atom cannot specify q twice Self-explanatory.

Fix property/atom mol when atom_style already has molecule attribute Self-explanatory.

Fix property/atom q when atom_style already has charge attribute Self-explanatory.

Fix property/atom vector name already exists The name for an integer or floating-point vector must be unique.

Fix qeq has negative upper Taper radius cutoff Self-explanatory.

Fix qeq/comb group has no atoms Self-explanatory.

Fix qeq/comb requires atom attribute q An atom style with charge must be used to perform charge equilibration.

Fix qeq/dynamic group has no atoms Self-explanatory.

Fix qeq/dynamic requires atom attribute q Self-explanatory.

Fix qeq/fire group has no atoms Self-explanatory.

Fix qeq/fire requires atom attribute q Self-explanatory.

Fix qeq/point group has no atoms Self-explanatory.

Fix qeq/point has insufficient QEq matrix size Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/point requires atom attribute q Self-explanatory.

Fix qeq/shielded group has no atoms Self-explanatory.

Fix qeq/shielded has insufficient QEq matrix size Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/shielded requires atom attribute q Self-explanatory.

Fix qeq/slater could not extract params from pair coul/streitz This should not happen unless pair coul/streitz has been altered.

Fix qeq/slater group has no atoms Self-explanatory.

Fix qeq/slater has insufficient QEq matrix size Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/slater requires atom attribute q Self-explanatory.
Fix reax/bonds numbonds > nsbmax_most  The limit of the number of bonds expected by the ReaxFF force field was exceeded.

Fix recenter group has no atoms  Self-explanatory.

Fix restrain requires an atom map, see atom_modify  Self-explanatory.

Fix rigid atom has non-zero image flag in a non-periodic dimension  Image flags for non-periodic dimensions should not be set.

Fix rigid file has no lines  Self-explanatory.

Fix rigid langevin period must be > 0.0  Self-explanatory.

Fix rigid molecule requires atom attribute molecule  Self-explanatory.

Fix rigid npt/nph dilate group ID does not exist  Self-explanatory.

Fix rigid npt/nph does not yet allow triclinic box  This is a current restriction in LAMMPS.

Fix rigid npt/nph period must be > 0.0  Self-explanatory.

Fix rigid npt/small t_chain should not be less than 1  Self-explanatory.

Fix rigid npt/small t_order must be 3 or 5  Self-explanatory.

Fix rigid npt/npt/nph damping parameters must be > 0.0  Self-explanatory.

Fix rigid npt/small t_chain should not be less than 1  Self-explanatory.

Fix rigid npt/small t_iter should not be less than 1  Self-explanatory.

Fix rigid npt/small t_order must be 3 or 5  Self-explanatory.

Fix rigid xy torque cannot be on for 2d simulation  Self-explanatory.

Fix rigid z force cannot be on for 2d simulation  Self-explanatory.

Fix rigid/npt period must be > 0.0  Self-explanatory.

Fix rigid/npt temperature order must be 3 or 5  Self-explanatory.

Fix rigid/npt/small period must be > 0.0  Self-explanatory.

Fix rigid/npt/npt/nph damping parameters must be > 0.0  Self-explanatory.

Fix rigid/small atom has non-zero image flag in a non-periodic dimension  Image flags for non-periodic dimensions should not be set.

Fix rigid/small langevin period must be > 0.0  Self-explanatory.

Fix rigid/small molecule must have atom types  The defined molecule does not specify atom types.

Fix rigid/small molecule must have coordinates  The defined molecule does not specify coordinates.

Fix rigid/small npt/nph period must be > 0.0  Self-explanatory.

Fix rigid/small npt/npt/nph damping parameters must be > 0.0  Self-explanatory.

Fix rigid/small npt/npt/nph dilate group ID does not exist  Self-explanatory.

Fix rigid/small requires an atom map, see atom_modify  Self-explanatory.

Fix rigid/small requires atom attribute molecule  Self-explanatory.
**Fix rigid: Bad principal moments** The principal moments of inertia computed for a rigid body are not within the required tolerances.

**Fix shake cannot be used with minimization** Cannot use fix shake while doing an energy minimization since it turns off bonds that should contribute to the energy.

**Fix shake molecule template must have shake info** The defined molecule does not specify SHAKE information.

**Fix spring couple group ID does not exist** Self-explanatory.

**Fix srd can only currently be used with comm_style brick** This is a current restriction in LAMMPS.

**Fix srd lambda must be >= 0.6 of SRD grid size** This is a requirement for accuracy reasons.

**Fix srd no-slip requires atom attribute torque** This is because the SRD collisions will impart torque to the solute particles.

**Fix srd requires SRD particles all have same mass** Self-explanatory.

**Fix srd requires ghost atoms store velocity** Use the comm_modify_vel yes command to enable this.

**Fix store/state compute array is accessed out-of-range** Self-explanatory.

**Fix store/state compute does not calculate a per-atom array** The compute calculates a per-atom vector.

**Fix store/state compute does not calculate a per-atom vector** The compute calculates a per-atom vector.

**Fix store/state compute does not calculate per-atom values** Computes that calculate global or local quantities cannot be used with fix store/state.

**Fix store/state fix array is accessed out-of-range** Self-explanatory.

**Fix store/state fix does not calculate a per-atom array** The fix calculates a per-atom vector.

**Fix store/state fix does not calculate a per-atom vector** The fix calculates a per-atom array.

**Fix store/state fix does not calculate per-atom values** Fixes that calculate global or local quantities cannot be used with fix store/state.

**Fix store/state for atom property that is not allocated** Self-explanatory.

**Fix store/state variable is not atom-style variable** Only atom-style variables calculate per-atom quantities.

**Fix temp/berendsen period must be > 0.0** Self-explanatory.

**Fix temp/berendsen variable returned negative temperature** Self-explanatory.

**Fix temp/csld is not compatible with fix rattle or fix shake** These two commands cannot currently be used together with fix temp/csld.

**Fix temp/csld variable returned negative temperature** Self-explanatory.

**Fix temp/edr variable returned negative temperature** Self-explanatory.

**Fix temp/rescale variable returned negative temperature** Self-explanatory.

**Fix tfmc displacement length must be > 0** Self-explanatory.

**Fix tfmc is not compatible with fix shake** These two commands cannot currently be used together.

**Fix tfmc temperature must be > 0** Self-explanatory.

**Fix thermal/conductivity swap value must be positive** Self-explanatory.

**Fix tmd must come after integration fixes** Any fix tmd command must appear in the input script after all time integration fixes (nve, nvt, npt). See the fix tmd documentation for details.
Fix ttm electron temperatures must be > 0.0  Self-explanatory.
Fix ttm electronic density must be > 0.0  Self-explanatory.
Fix ttm electronic specific heat must be > 0.0  Self-explanatory.
Fix ttm electronic thermal conductivity must be >= 0.0  Self-explanatory.
Fix ttm gamma_p must be > 0.0  Self-explanatory.
Fix ttm gamma_s must be >= 0.0  Self-explanatory.
Fix ttm number of nodes must be > 0  Self-explanatory.
Fix ttm v_0 must be >= 0.0  Self-explanatory.

Fix used in compute chunk/atom not computed at compatible time  The chunk/atom compute cannot query the output of the fix on a timestep it is needed.
Fix used in compute reduce not computed at compatible time  Fixes generate their values on specific timesteps. Compute reduce is requesting a value on a non-allowed timestep.
Fix used in compute slice not computed at compatible time  Fixes generate their values on specific timesteps. Compute slice is requesting a value on a non-allowed timestep.
Fix vector cannot set output array intensive/extensive from these inputs  The inputs to the command have conflicting intensive/extensive attributes. You need to use more than one fix vector command.
Fix vector compute does not calculate a scalar  Self-explanatory.
Fix vector compute does not calculate a vector  Self-explanatory.
Fix vector compute vector is accessed out-of-range  Self-explanatory.
Fix vector fix does not calculate a scalar  Self-explanatory.
Fix vector fix does not calculate a vector  Self-explanatory.
Fix vector fix vector is accessed out-of-range  Self-explanatory.
Fix viscosity swap value must be positive  Self-explanatory.
Fix viscosity vtarget value must be positive  Self-explanatory.
Fix wall cutoff <= 0.0  Self-explanatory.
Fix wall/colloid requires atom style sphere  Self-explanatory.
Fix wall/colloid requires extended particles  One of the particles has radius 0.0.
Fix wall/gran is incompatible with Pair style  Must use a granular pair style to define the parameters needed for this fix.
Fix wall/gran requires atom style sphere  Self-explanatory.
Fix wall/piston command only available at zlo  The face keyword must be zlo.
Fix wall/region colloid requires atom style sphere  Self-explanatory.
Fix wall/region colloid requires extended particles  One of the particles has radius 0.0.
Fix wall/region cutoff <= 0.0  Self-explanatory.
Fix modify pressure ID does not compute pressure  The compute ID assigned to the fix must compute pressure.
Fix modify temperature ID does not compute temperature  The compute ID assigned to the fix must compute temperature.
For triclinic deformation, specified target stress must be hydrostatic. Triclinic pressure control is allowed using the tri keyword, but non-hydrostatic pressure control can not be used in this case.

Found no restart file matching pattern. When using a "*" in the restart file name, no matching file was found.

GPU library not compiled for this accelerator. Self-explanatory.

GPU package does not (yet) work with atom_style template. Self-explanatory.

GPU particle split must be set to 1 for this pair style. For this pair style, you cannot run part of the force calculation on the host. See the package command.

GPUs are requested but Kokkos has not been compiled for CUDA. Re-compile Kokkos with CUDA support to use GPUs.

Ghost velocity forward comm not yet implemented with Kokkos. This is a current restriction.

Gmask function in equal-style variable formula. Gmask is per-atom operation.

Gravity changed since fix pour was created. The gravity vector defined by fix gravity must be static.

Gravity must point in -y to use with fix pour in 2d. Self-explanatory.

Gravity must point in -z to use with fix pour in 3d. Self-explanatory.

Grmask function in equal-style variable formula. Grmask is per-atom operation.

Group ID does not exist. A group ID used in the group command does not exist.

Group ID in variable formula does not exist. Self-explanatory.

Group all cannot be made dynamic. This operation is not allowed.

Group command before simulation box is defined. The group command cannot be used before a read_data, read_restart, or create_box command.

Group dynamic cannot reference itself. Self-explanatory.

Group dynamic parent group cannot be dynamic. Self-explanatory.

Group dynamic parent group does not exist. Self-explanatory.

Group region ID does not exist. A region ID used in the group command does not exist.

If read_dump purges it cannot replace or trim. These operations are not compatible. See the read_dump doc page for details.

Illegal ... command. Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.

Illegal COMB parameter. One or more of the coefficients defined in the potential file is invalid.

Illegal COMB3 parameter. One or more of the coefficients defined in the potential file is invalid.

Illegal Stillinger-Weber parameter. One or more of the coefficients defined in the potential file is invalid.

Illegal Tersoff parameter. One or more of the coefficients defined in the potential file is invalid.

Illegal Vashishta parameter. One or more of the coefficients defined in the potential file is invalid.

Illegal compute voronoi/atom command (occupation and (surface or edges)). Self-explanatory.

Illegal coul/streitz parameter. One or more of the coefficients defined in the potential file is invalid.

Illegal dump_modify sfactor value (must be > 0.0). Self-explanatory.

Illegal dump_modify tfactor value (must be > 0.0). Self-explanatory.
Illegal fix gcmc gas mass <= 0 The computed mass of the designated gas molecule or atom type was less than or equal to zero.

Illegal fix tfmc random seed Seeds can only be nonzero positive integers.

Illegal fix wall/piston velocity The piston velocity must be positive.

Illegal integrate style Self-explanatory.

Illegal nb3b/harmonic parameter One or more of the coefficients defined in the potential file is invalid.

Illegal number of angle table entries There must be at least 2 table entries.

Illegal number of bond table entries There must be at least 2 table entries.

Illegal number of pair table entries There must be at least 2 table entries.

Illegal or unset periodicity in restart This error should not normally occur unless the restart file is invalid.

Illegal range increment value The increment must be >= 1.

Illegal simulation box The lower bound of the simulation box is greater than the upper bound.

Illegal size double vector read requested This error should not normally occur unless the restart file is invalid.

Illegal size integer vector read requested This error should not normally occur unless the restart file is invalid.

Illegal size string or corrupt restart This error should not normally occur unless the restart file is invalid.

Imageint setting in lmptype.h is invalid Imageint must be as large or larger than smallint.

Imageint setting in lmptype.h is not compatible Format of imageint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Improper atom missing in delete_bonds The delete_bonds command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

Improper atom missing in set command The set command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

Improper atoms %d %d %d %d missing on proc %d at step %ld One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

Improper atoms missing on proc %d at step %ld One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

Improper coeff for hybrid has invalid style Improper style hybrid uses another improper style as one of its coefficients. The improper style used in the improper_coeff command or read from a restart file is not recognized.

Improper coeffs are not set No improper coefficients have been assigned in the data file or via the improper_coeff command.

Improper style hybrid cannot have hybrid as an argument Self-explanatory.

Improper style hybrid cannot have none as an argument Self-explanatory.

Improper style hybrid cannot use same improper style twice Self-explanatory.

Improper_coeff command before improper_style is defined Coefficients cannot be set in the data file or via the improper_coeff command until an improper_style has been assigned.

Improper_coeff command before simulation box is defined The improper_coeff command cannot be used before a read_data, read_restart, or create_box command.
Improper_coeff command when no impropers allowed  The chosen atom style does not allow for impropers to be defined.

Improper_style command when no impropers allowed  The chosen atom style does not allow for impropers to be defined.

Impropers assigned incorrectly  Impropers read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Impropers defined but no improper types  The data file header lists improper but no improper types.

Incompatible KIM Simulator Model  The requested KIM Simulator Model was defined for a different MD code and thus is not compatible with LAMMPS.

Incompatible units for KIM Simulator Model  The selected unit style is not compatible with the requested KIM Simulator Model.

Incomplete use of variables in create_atoms command  The var and set options must be used together.

Inconsistent iparam/jparam values in fix bond/create command  If itype and jtype are the same, then their maxbond and newtype settings must also be the same.

Inconsistent line segment in data file  The end points of the line segment are not equal distances from the center point which is the atom coordinate.

Inconsistent triangle in data file  The centroid of the triangle as defined by the corner points is not the atom coordinate.

Inconsistent use of finite-size particles by molecule template molecules  Not all of the molecules define a radius for their constituent particles.

Incorrect # of floating-point values in Bodies section of data file  See doc page for body style.

Incorrect # of integer values in Bodies section of data file  See doc page for body style.

Incorrect %s format in data file  A section of the data file being read by fix property/atom does not have the correct number of values per line.

Incorrect SNAP parameter file  The file cannot be parsed correctly, check its internal syntax.

Incorrect args for angle coefficients  Self-explanatory. Check the input script or data file.

Incorrect args for bond coefficients  Self-explanatory. Check the input script or data file.

Incorrect args for dihedral coefficients  Self-explanatory. Check the input script or data file.

Incorrect args for improper coefficients  Self-explanatory. Check the input script or data file.

Incorrect args for pair coefficients  Self-explanatory. Check the input script or data file.

Incorrect args in pair_style command  Self-explanatory.

Incorrect atom format in data file  Number of values per atom line in the data file is not consistent with the atom style.

Incorrect atom format in neb file  The number of fields per line is not what expected.

Incorrect bonus data format in data file  See the read_data doc page for a description of how various kinds of bonus data must be formatted for certain atom styles.

Incorrect boundaries with slab Ewald  Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.

Incorrect boundaries with slab EwaldDisp  Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.
Incorrect boundaries with slab PPPM  Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with PPPM.

Incorrect boundaries with slab PPPMDisp  Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with pppm/disp.

Incorrect conversion in format string  A format style variable was not using either a %f, a %g, or a %e conversion. Or an immediate variable with format suffix was not using either a %f, a %g or a %e conversion in the format suffix.

Incorrect element names in ADP potential file  The element names in the ADP file do not match those requested.

Incorrect element names in EAM potential file  The element names in the EAM file do not match those requested.

Incorrect format of . . . section in data file  Number or type of values per line in the given section of the data file is not consistent with the requirements for this section.

Incorrect format in COMB potential file  Incorrect number of words per line in the potential file.

Incorrect format in COMB3 potential file  Incorrect number of words per line in the potential file.

Incorrect format in MEAM library file  Incorrect number of words per line in the potential file.

Incorrect format in SNAP coefficient file  Incorrect number of words per line in the coefficient file.

Incorrect format in SNAP parameter file  Incorrect number of words per line in the parameter file.

Incorrect format in Stillinger-Weber potential file  Incorrect number of words per line in the potential file.

Incorrect format in TMD target file  Format of file read by fix tmd command is incorrect.

Incorrect format in Tersoff potential file  Incorrect number of words per line in the potential file.

Incorrect format in Vashishta potential file  Incorrect number of words per line in the potential file.

Incorrect format in coul/streitz potential file  Incorrect number of words per line in the potential file.

Incorrect format in nb3b/harmonic potential file  Incorrect number of words per line in the potential file.

Incorrect integer value in Bodies section of data file  See doc page for body style.

Incorrect multiplicity arg for dihedral coefficients  Self-explanatory. Check the input script or data file.

Incorrect number of elements in potential file  Self-explanatory.

Incorrect rigid body format in fix rigid file  The number of fields per line is not what expected.

Incorrect rigid body format in fix rigid/small file  The number of fields per line is not what expected.

Incorrect sign arg for dihedral coefficients  Self-explanatory. Check the input script or data file.

Incorrect table format check for element types  Self-explanatory.

Incorrect velocity format in data file  Each atom style defines a format for the Velocity section of the data file. The read-in lines do not match.

Incorrect weight arg for dihedral coefficients  Self-explanatory. Check the input script or data file.

Index between variable brackets must be positive  Self-explanatory.

Indexed per-atom vector in variable formula without atom map  Accessing a value from an atom vector requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom_modify map command will force an atom map to be created.

Initial temperatures not all set in fix ttm  Self-explanatory.

Input line quote not followed by white-space  An end quote must be followed by white-space.

Insertion region extends outside simulation box  Self-explanatory.
Insufficient Jacobi rotations for POEMS body  Eigensolve for rigid body was not sufficiently accurate.
Insufficient Jacobi rotations for body nparticle  Eigensolve for rigid body was not sufficiently accurate.
Insufficient Jacobi rotations for rigid body  Eigensolve for rigid body was not sufficiently accurate.
Insufficient Jacobi rotations for rigid molecule  Eigensolve for rigid body was not sufficiently accurate.
Insufficient Jacobi rotations for triangle  The calculation of the inertia tensor of the triangle failed. This should not happen if it is a reasonably shaped triangle.
Insufficient memory on accelerator  There is insufficient memory on one of the devices specified for the gpu package
Internal error in atom_style body  This error should not occur. Contact the developers.
Invalid -reorder N value  Self-explanatory.
Invalid Angles section in molecule file  Self-explanatory.
Invalid Bonds section in molecule file  Self-explanatory.
Invalid Boolean syntax in if command  Self-explanatory.
Invalid Charges section in molecule file  Self-explanatory.
Invalid Coords section in molecule file  Self-explanatory.
Invalid Diameters section in molecule file  Self-explanatory.
Invalid Dihedrals section in molecule file  Self-explanatory.
Invalid Impropers section in molecule file  Self-explanatory.
Invalid Kokkos command-line args  Self-explanatory. See Section 2.7 of the manual for details.
Invalid LAMMPS restart file  The file does not appear to be a LAMMPS restart file since it does not contain the correct magic string at the beginning.
Invalid Masses section in molecule file  Self-explanatory.
Invalid molecule ID in molecule file  Molecule ID must be a non-zero positive integer.
Invalid Molecules section in molecule file  Self-explanatory.
Invalid REAX atom type  There is a mis-match between LAMMPS atom types and the elements listed in the ReaxFF force field file.
Invalid Special Bond Counts section in molecule file  Self-explanatory.
Invalid Types section in molecule file  Self-explanatory.
Invalid angle count in molecule file  Self-explanatory.
Invalid angle table length  Length must be 2 or greater.
Invalid angle type in Angles section of data file  Angle type must be positive integer and within range of specified angle types.
Invalid angle type in Angles section of molecule file  Self-explanatory.
Invalid angle type index for fix shake  Self-explanatory.
Invalid args for non-hybrid pair coefficients  “NULL” is only supported in pair_coeff calls when using pair hybrid
Invalid argument to factorial %d  N must be >= 0 and <= 167, otherwise the factorial result is too large.
Invalid atom ID in %s section of data file  An atom in a section of the data file being read by fix property/atom has an invalid atom ID that is <= 0 or > the maximum existing atom ID.
Invalid atom ID in Angles section of data file  Atom IDs must be positive integers and within range of defined atoms.
Invalid atom ID in Angles section of molecule file  Self-explanatory.
Invalid atom ID in Atoms section of data file  Atom IDs must be positive integers.
Invalid atom ID in Bodies section of data file  Atom IDs must be positive integers and within range of defined atoms.
Invalid atom ID in Bonds section of data file  Atom IDs must be positive integers and within range of defined atoms.
Invalid atom ID in Bonds section of molecule file  Self-explanatory.
Invalid atom ID in Bonus section of data file  Atom IDs must be positive integers and within range of defined atoms.
Invalid atom ID in Dihedrals section of data file  Atom IDs must be positive integers and within range of defined atoms.
Invalid atom ID in Fragments section of molecule file  Self-explanatory.
Invalid atom ID in Impropers section of data file  Atom IDs must be positive integers and within range of defined atoms.
Invalid atom ID in Velocities section of data file  Atom IDs must be positive integers and within range of defined atoms.
Invalid atom ID in dihedrals section of molecule file  Self-explanatory.
Invalid atom ID in impropers section of molecule file  Self-explanatory.
Invalid atom ID in variable file  Self-explanatory.
Invalid atom IDs in neb file  An ID in the file was not found in the system.
Invalid atom diameter in molecule file  Diameters must be >= 0.0.
Invalid atom mass for fix shake  Mass specified in fix shake command must be > 0.0.
Invalid atom mass in molecule file  Masses must be > 0.0.
Invalid atom type in Atoms section of data file  Atom types must range from 1 to specified # of types.
Invalid atom type in create_atoms command  The create_box command specified the range of valid atom types. An invalid type is being requested.
Invalid atom type in create_atoms mol command  The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.
Invalid atom type in fix atom/swap command  The atom type specified in the atom/swap command does not exist.
Invalid atom type in fix bond/create command  Self-explanatory.
Invalid atom type in fix deposit command  Self-explanatory.
Invalid atom type in fix deposit mol command  The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.
Invalid atom type in fix gcmc command  The atom type specified in the gcmc command does not exist.
Invalid atom type in fix pour command  Self-explanatory.
Invalid atom type in fix pour mol command  The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.
Invalid atom type in molecule file  Atom types must range from 1 to specified # of types.
Invalid atom type in neighbor exclusion list  Atom types must range from 1 to Ntypes inclusive.
Invalid atom type index for fix shake  Atom types must range from 1 to Ntypes inclusive.
Invalid atom types in pair_write command  Atom types must range from 1 to Ntypes inclusive.
Invalid atom vector in variable formula  The atom vector is not recognized.
Invalid atom_style body command  No body style argument was provided.
Invalid atom_style command  Self-explanatory.
Invalid attribute in dump custom command  Self-explanatory.
Invalid attribute in dump local command  Self-explanatory.
Invalid attribute in dump modify command  Self-explanatory.
Invalid basis setting in create_atoms command  The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.
Invalid basis setting in fix append/atoms command  The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.
Invalid bin bounds in compute chunk/atom  The lo/hi values are inconsistent.
Invalid bin bounds in fix ave/spatial  The lo/hi values are inconsistent.
Invalid body nparticle command  Arguments in atom-style command are not correct.
Invalid bond count in molecule file  Self-explanatory.
Invalid bond table length  Length must be 2 or greater.
Invalid bond type in Bonds section of data file  Bond type must be positive integer and within range of specified bond types.
Invalid bond type in Bonds section of molecule file  Self-explanatory.
Invalid bond type in create_bonds command  Self-explanatory.
Invalid bond type in fix bond/break command  Self-explanatory.
Invalid bond type in fix bond/create command  Self-explanatory.
Invalid bond type index for fix shake  Self-explanatory. Check the fix shake command in the input script.
Invalid coeffs for this dihedral style  Cannot set class 2 coeffs in data file for this dihedral style.
Invalid color in dump_modify command  The specified color name was not in the list of recognized colors. See the dump_modify doc page.
Invalid color map min/max values  The min/max values are not consistent with either each other or with values in the color map.
Invalid command-line argument  One or more command-line arguments is invalid. Check the syntax of the command you are using to launch LAMMPS.
Invalid compute ID in variable formula  The compute is not recognized.
Invalid create_atoms rotation vector for 2d model  The rotation vector can only have a z component.
Invalid custom OpenCL parameter string  There are not enough or too many parameters in the custom string for package GPU.
Invalid cutoff in comm_modify command  Specified cutoff must be >= 0.0.
Invalid cutoffs in pair_write command  Inner cutoff must be larger than 0.0 and less than outer cutoff.
Invalid d1 or d2 value for pair colloid coeff  Neither d1 or d2 can be < 0.
Invalid data file section: Angle Coeffs Atom style does not allow angles.
Invalid data file section: AngleAngle Coeffs Atom style does not allow impropers.
Invalid data file section: AngleAngleTorsion Coeffs Atom style does not allow dihedrals.
Invalid data file section: AngleTorsion Coeffs Atom style does not allow dihedrals.
Invalid data file section: Angles Atom style does not allow angles.
Invalid data file section: Bodies Atom style does not allow bodies.
Invalid data file section: Bond Coeffs Atom style does not allow bonds.
Invalid data file section: BondAngle Coeffs Atom style does not allow angles.
Invalid data file section: BondBond Coeffs Atom style does not allow angles.
Invalid data file section: BondBond13 Coeffs Atom style does not allow dihedrals.
Invalid data file section: Bonds Atom style does not allow bonds.
Invalid data file section: Dihedral Coeffs Atom style does not allow dihedrals.
Invalid data file section: Dihedrals Atom style does not allow dihedrals.
Invalid data file section: Ellipsoids Atom style does not allow ellipsoids.
Invalid data file section: EndBondTorsion Coeffs Atom style does not allow dihedrals.
Invalid data file section: Improper Coeffs Atom style does not allow impropers.
Invalid data file section: Impropers Atom style does not allow impropers.
Invalid data file section: Lines Atom style does not allow lines.
Invalid data file section: MiddleBondTorsion Coeffs Atom style does not allow dihedrals.
Invalid data file section: Triangles Atom style does not allow triangles.
Invalid delta_conf in tad command The value must be between 0 and 1 inclusive.
Invalid density in Atoms section of data file Density value cannot be <= 0.0.
Invalid density in set command Density must be > 0.0.
Invalid dihedral count in molecule file Self-explanatory.
Invalid dihedral type in Dihedrals section of data file Dihedral type must be positive integer and within range of specified dihedral types.
Invalid dihedral type in dihedrals section of molecule file Self-explanatory.
Invalid dipole length in set command Self-explanatory.
Invalid displace_atoms rotate axis for 2d Axis must be in z direction.
Invalid dump dcd filename Filenames used with the dump dcd style cannot be binary or compressed or cause multiple files to be written.
Invalid dump frequency Dump frequency must be 1 or greater.
Invalid dump image element name The specified element name was not in the standard list of elements. See the dump_modify doc page.
Invalid dump image filename The file produced by dump image cannot be binary and must be for a single processor.
Invalid dump image persp value Persp value must be >= 0.0.
Invalid dump image theta value  Theta must be between 0.0 and 180.0 inclusive.

Invalid dump image zoom value  Zoom value must be > 0.0.

Invalid dump movie filename  The file produced by dump movie cannot be binary or compressed and must be a single file for a single processor.

Invalid dump xtc filename  Filenames used with the dump xtc style cannot be binary or compressed or cause multiple files to be written.

Invalid dump xyz filename  Filenames used with the dump xyz style cannot be binary or cause files to be written by each processor.

Invalid dump_modify threshold operator  Operator keyword used for threshold specification in not recognized.

Invalid entry in -reorder file  Self-explanatory.

Invalid fix ID in variable formula  The fix is not recognized.

Invalid fix ave/time off column  Self-explanatory.

Invalid fix box/relax command for a 2d simulation  Fix box/relax styles involving the z dimension cannot be used in a 2d simulation.

Invalid fix box/relax command pressure settings  If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix box/relax pressure settings  Settings for coupled dimensions must be the same.

Invalid fix halt attribute  Self-explanatory.

Invalid fix halt operator  Self-explanatory.

Invalid fix nvt/npt/nph command for a 2d simulation  Cannot control z dimension in a 2d model.

Invalid fix nvt/npt/nph command pressure settings  If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix nvt/npt/nph pressure settings  Settings for coupled dimensions must be the same.

Invalid fix press/berendsen for a 2d simulation  The z component of pressure cannot be controlled for a 2d model.

Invalid fix press/berendsen pressure settings  Settings for coupled dimensions must be the same.

Invalid fix qeq parameter file  Element index > number of atom types.

Invalid fix rigid npt/nph command for a 2d simulation  Cannot control z dimension in a 2d model.

Invalid fix rigid npt/nph command pressure settings  If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix rigid/small npt/nph command pressure settings  If multiple dimensions are coupled, those dimensions must be specified.

Invalid flag in force field section of restart file  Unrecognized entry in restart file.

Invalid flag in header section of restart file  Unrecognized entry in restart file.

Invalid flag in peratom section of restart file  The format of this section of the file is not correct.

Invalid flag in type arrays section of restart file  Unrecognized entry in restart file.

Invalid frequency in temper command  Nevery must be > 0.

Invalid group ID in neigh_modify command  A group ID used in the neigh_modify command does not exist.

Invalid group function in variable formula  Group function is not recognized.
Invalid group in comm_modify command  Self-explanatory.

Invalid image up vector  Up vector cannot be (0,0,0).

Invalid immediate variable  Syntax of immediate value is incorrect.

Invalid improper count in molecule file  Self-explanatory.

Invalid improper type in Impropers section of data file  Improper type must be positive integer and within range of specified improper types.

Invalid improper type in impropers section of molecule file  Self-explanatory.

Invalid index for non-body particles in compute body/local command  Only indices 1,2,3 can be used for non-body particles.

Invalid index in compute body/local command  Self-explanatory.

Invalid is_active() function in variable formula  Self-explanatory.

Invalid is_available() function in variable formula  Self-explanatory.

Invalid is_defined() function in variable formula  Self-explanatory.

Invalid keyword in angle table parameters  Self-explanatory.

Invalid keyword in bond table parameters  Self-explanatory.

Invalid keyword in compute angle/local command  Self-explanatory.

Invalid keyword in compute bond/local command  Self-explanatory.

Invalid keyword in compute dihedral/local command  Self-explanatory.

Invalid keyword in compute improper/local command  Self-explanatory.

Invalid keyword in compute pair/local command  Self-explanatory.

Invalid keyword in compute property/atom command  Self-explanatory.

Invalid keyword in compute property/chunk command  Self-explanatory.

Invalid keyword in compute property/local command  Self-explanatory.

Invalid keyword in dump cfg command  Self-explanatory.

Invalid pair table cutoff  Cutoffs in pair_coeff command are not valid with read-in pair table.

Invalid pair table parameters  Keyword used in list of table parameters is not recognized.

Invalid length in set command  Self-explanatory.

Invalid mass in set command  Self-explanatory.

Invalid mass line in data file  Self-explanatory.

Invalid mass value  Self-explanatory.

Invalid math function in variable formula  Self-explanatory.

Invalid math/group/special function in variable formula  Self-explanatory.

Invalid option in lattice command for non-custom style  Certain lattice keywords are not supported unless the lattice style is “custom”.

Invalid order of forces within respa levels  For respa, ordering of force computations within respa levels must obey certain rules. E.g. bonds cannot be compute less frequently than angles, pairwise forces cannot be computed less frequently than kspace, etc.

Invalid pair table cutoff  Cutoffs in pair_coeff command are not valid with read-in pair table.

Invalid pair table length  Length of read-in pair table is invalid.
Invalid param file for fix qeq/shielded  Invalid value of gamma.
Invalid param file for fix qeq/slater  Zeta value is 0.0.
Invalid partitions in processors part command  Valid partitions are numbered 1 to N and the sender and receiver cannot be the same partition.
Invalid python command  Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.
Invalid radius in Atoms section of data file  Radius must be >= 0.0.
Invalid random number seed in fix ttm command  Random number seed must be > 0.
Invalid random number seed in set command  Random number seed must be > 0.
Invalid replace values in compute reduce  Self-explanatory.
Invalid rigid body ID in fix rigid file  The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid command.
Invalid rigid body ID in fix rigid/small file  The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid/small command.
Invalid run command N value  The number of timesteps must fit in a 32-bit integer. If you want to run for more steps than this, perform multiple shorter runs.
Invalid run command start/stop value  Self-explanatory.
Invalid run command upto value  Self-explanatory.
Invalid seed for Marsaglia random # generator  The initial seed for this random number generator must be a positive integer less than or equal to 900 million.
Invalid seed for Park random # generator  The initial seed for this random number generator must be a positive integer.
Invalid shake angle type in molecule file  Self-explanatory.
Invalid shake atom in molecule file  Self-explanatory.
Invalid shake bond type in molecule file  Self-explanatory.
Invalid shake flag in molecule file  Self-explanatory.
Invalid shape in Ellipsoids section of data file  Self-explanatory.
Invalid shape in Triangles section of data file  Two or more of the triangle corners are duplicate points.
Invalid shape in set command  Self-explanatory.
Invalid shear direction for fix wall/gran  Self-explanatory.
Invalid special atom index in molecule file  Self-explanatory.
Invalid special function in variable formula  Self-explanatory.
Invalid style in pair_write command  Self-explanatory. Check the input script.
Invalid syntax in variable formula  Self-explanatory.
Invalid t_event in prd command  Self-explanatory.
Invalid t_event in tad command  The value must be greater than 0.
Invalid template atom in Atoms section of data file  The atom indices must be between 1 to N, where N is the number of atoms in the template molecule the atom belongs to.
Invalid template index in Atoms section of data file The template indices must be between 1 to N, where N is the number of molecules in the template.

Invalid thermo keyword in variable formula The keyword is not recognized.

Invalid threads_per_atom specified. For 3-body potentials on the GPU, the threads_per_atom setting cannot be greater than 4 for NVIDIA GPUs.

Invalid timestep reset for fix ave/atom Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/chunk Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/correlate Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/histo Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/spatial Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/time Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid tmax in tad command The value must be greater than 0.0.

Invalid type for mass set Mass command must set a type from 1-N where N is the number of atom types.

Invalid use of library file() function This function is called through the library interface. This error should not occur. Contact the developers if it does.

Invalid value in set command The value specified for the setting is invalid, likely because it is too small or too large.

Invalid variable evaluation in variable formula A variable used in a formula could not be evaluated.

Invalid variable in next command Self-explanatory.

Invalid variable name Variable name used in an input script line is invalid.

Invalid variable name in variable formula Variable name is not recognized.

Invalid variable style in special function next Only file-style or atomfile-style variables can be used with next().

Invalid variable style with next command Variable styles equal and world cannot be used in a next command.

Invalid volume in set command Volume must be > 0.0.

Invalid wiggle direction for fix wall/gran Self-explanatory.

Invoked angle equil angle on angle style none Self-explanatory.

Invoked angle single on angle style none Self-explanatory.

Invoked bond equil distance on bond style none Self-explanatory.

Invoked bond single on bond style none Self-explanatory.

Invoked pair single on pair style none A command (e.g. a dump) attempted to invoke the single() function on a pair style none, which is illegal. You are probably attempting to compute per-atom quantities with an undefined pair style.

Invoking coulombic in pair style lj/coul requires atom attribute q The atom style defined does not have this attribute.

Invoking coulombic in pair style lj/long/dipole/long requires atom attribute q The atom style defined does not have these attributes.
**KIM Simulator Model has no Model definition**  There is no model definition (key: model-defn) in the KIM Simulator Model. Please contact the OpenKIM database maintainers to verify and potentially correct this.

**KOKKOS package does not yet support comm_style tiled**  Self-explanatory.

**KOKKOS package requires a kokkos enabled atom_style**  Self-explanatory.

**KSpace accuracy must be > 0**  The kspace accuracy designated in the input must be greater than zero.

**KSpace accuracy too large to estimate G vector**  Reduce the accuracy request or specify gewald explicitly via the kspace_modify command.

**KSpace accuracy too low**  Requested accuracy must be less than 1.0.

**KSpace solver requires a pair style**  No pair style is defined.

**KSpace style does not yet support triclinic geometries**  The specified kspace style does not allow for non-orthogonal simulation boxes.

**KSpace style has not yet been set**  Cannot use kspace_modify command until a kspace style is set.

**KSpace style is incompatible with Pair style**  Setting a kspace style requires that a pair style with matching long-range Coulombic or dispersion components be used.

**Keyword %s in MEAM parameter file not recognized**  Self-explanatory.

**Kokkos has been compiled for CUDA but no GPUs are requested**  One or more GPUs must be used when Kokkos is compiled for CUDA.

**Kspace_modify mesh parameter must be all zero or all positive**  Valid kspace mesh parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero (the default).

**Kspace_modify mesh/disp parameter must be all zero or all positive**  Valid kspace mesh/disp parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero and the required accuracy via force/disp/real as well as force/disp/kspace is set.

**Kspace style does not support compute group/group**  Self-explanatory.

**Kspace style pppm/disp/tip4p requires newton on**  Self-explanatory.

**Kspace style pppm/tip4p requires newton on**  Self-explanatory.

**Kspace style requires atom attribute q**  The atom style defined does not have these attributes.

**Kspace_modify eigtol must be smaller than one**  Self-explanatory.

**LAMMPS is not built with Python embedded**  This is done by including the PYTHON package before LAMMPS is built. This is required to use python-style variables.

**LAMMPS unit_style lj not supported by KIM models**  Self-explanatory. Check the input script or data file.

**LJ6 off not supported in pair_style buck/long/coul/long**  Self-explanatory.

**Label wasn’t found in input script**  Self-explanatory.

**Lattice orient vectors are not orthogonal**  The three specified lattice orientation vectors must be mutually orthogonal.

**Lattice orient vectors are not right-handed**  The three specified lattice orientation vectors must create a right-handed coordinate system such that a1 cross a2 = a3.

**Lattice primitive vectors are collinear**  The specified lattice primitive vectors do not for a unit cell with non-zero volume.

**Lattice settings are not compatible with 2d simulation**  One or more of the specified lattice vectors has a non-zero z component.

**Lattice spacings are invalid**  Each x,y,z spacing must be > 0.
**Lattice style incompatible with simulation dimension**  2d simulation can use sq, sq2, or hex lattice. 3d simulation can use sc, bcc, or fcc lattice.

**Log of zero/negative value in variable formula**  Self-explanatory.

**Lost atoms via balance: original %ld current %ld**  This should not occur. Report the problem to the developers.

**Lost atoms: original %ld current %ld**  Lost atoms are checked for each time thermo output is done. See the thermo_modify lost command for options. Lost atoms usually indicate bad dynamics, e.g. atoms have been blown far out of the simulation box, or moved further than one processor’s sub-domain away before reneighboring.

**MEAM library error %d**  A call to the MEAM Fortran library returned an error.

**MPI_LMP_BIGINT and bigint in lmptype.h are not compatible**  The size of the MPI datatype does not match the size of a bigint.

**MPI_LMP_TAGINT and tagint in lmptype.h are not compatible**  The size of the MPI datatype does not match the size of a tagint.

**MSM can only currently be used with comm_style brick**  This is a current restriction in LAMMPS.

**MSM grid is too large**  The global MSM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 16384. You likely need to decrease the requested accuracy.

**MSM order must be 4, 6, 8, or 10**  This is a limitation of the MSM implementation in LAMMPS: the MSM order can only be 4, 6, 8, or 10.

**Mass command before simulation box is defined**  The mass command cannot be used before a read_data, read_restart, or create_box command.

**Matrix factorization to split dispersion coefficients failed**  This should not normally happen. Contact the developers.

**Min_style command before simulation box is defined**  The min_style command cannot be used before a read_data, read_restart, or create_box command.

**Minimization could not find thermo_pe compute**  This compute is created by the thermo command. It must have been explicitly deleted by a uncompute command.

**Minimize command before simulation box is defined**  The minimize command cannot be used before a read_data, read_restart, or create_box command.

**Mismatched brackets in variable**  Self-explanatory.

**Mismatched compute in variable formula**  A compute is referenced incorrectly or a compute that produces per-atom values is used in an equal-style variable formula.

**Mismatched fix in variable formula**  A fix is referenced incorrectly or a fix that produces per-atom values is used in an equal-style variable formula.

**Mismatched parameter in MEAM library file: z!=lat**  The coordination number and lattice do not match, check that consistent values are given.

**Mismatched variable in variable formula**  A variable is referenced incorrectly or an atom-style variable that produces per-atom values is used in an equal-style variable formula.

**Modulo 0 in variable formula**  Self-explanatory.

**Molecule IDs too large for compute chunk/atom**  The IDs must not be larger than can be stored in a 32-bit integer since chunk IDs are 32-bit integers.

**Molecule auto special bond generation overflow**  Counts exceed maxspecial setting for other atoms in system.

**Molecule file has angles but no nangles setting**  Self-explanatory.

**Molecule file has body params but no setting for them**  Self-explanatory.
Molecule file has bonds but no nbonds setting  Self-explanatory.
Molecule file has dihedrals but no ndihedrals setting  Self-explanatory.
Molecule file has impropers but no nimpropers setting  Self-explanatory.
Molecule file has no Body Doubles section  Self-explanatory.
Molecule file has no Body Integers section  Self-explanatory.
Molecule file has special flags but no bonds  Self-explanatory.
Molecule file needs both Special Bond sections  Self-explanatory.
Molecule file requires atom style body  Self-explanatory.
Molecule file shake flags not before shake atoms  The order of the two sections is important.
Molecule file shake flags not before shake bonds  The order of the two sections is important.
Molecule file shake info is incomplete  All 3 SHAKE sections are needed.
Molecule file special list does not match special count  The number of values in an atom’s special list does not match count.
Molecule file z center-of-mass must be 0.0 for 2d  Self-explanatory.
Molecule file z coord must be 0.0 for 2d  Self-explanatory.
Molecule natoms must be 1 for body particle  Self-explanatory.
Molecule sizescale must be 1.0 for body particle  Self-explanatory.
Molecule template ID for atom_style template does not exist  Self-explanatory.
Molecule template ID for create_atoms does not exist  Self-explanatory.
Molecule template ID for fix deposit does not exist  Self-explanatory.
Molecule template ID for fix gcmc does not exist  Self-explanatory.
Molecule template ID for fix pour does not exist  Self-explanatory.
Molecule template ID for fix rigid/small does not exist  Self-explanatory.
Molecule template ID for fix shake does not exist  Self-explanatory.
Molecule template ID must be alphanumeric or underscore characters  Self-explanatory.
Molecule topology/atom exceeds system topology/atom  The number of bonds, angles, etc per-atom in the molecule exceeds the system setting. See the create_box command for how to specify these values.
Molecule topology type exceeds system topology type  The number of bond, angle, etc types in the molecule exceeds the system setting. See the create_box command for how to specify these values.
More than one fix deform  Only one fix deform can be defined at a time.
More than one fix freeze  Only one of these fixes can be defined, since the granular pair potentials access it.
More than one fix shake  Only one fix shake can be defined.
Mu not allowed when not using semi-grand in fix atom/swap command  Self-explanatory.
Must define angle_style before Angle Coeffs  Must use an angle_style command before reading a data file that defines Angle Coeffs.
Must define angle_style before BondAngle Coeffs  Must use an angle_style command before reading a data file that defines Angle Coeffs.
Must define angle_style before BondBond Coeffs  Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define bond_style before Bond Coeffs  Must use a bond_style command before reading a data file that defines Bond Coeffs.

Must define dihedral_style before AngleAngleTorsion Coeffs  Must use a dihedral_style command before reading a data file that defines AngleAngleTorsion Coeffs.

Must define dihedral_style before AngleTorsion Coeffs  Must use a dihedral_style command before reading a data file that defines AngleTorsion Coeffs.

Must define dihedral_style before BondBond13 Coeffs  Must use a dihedral_style command before reading a data file that defines BondBond13 Coeffs.

Must define dihedral_style before Dihedral Coeffs  Must use a dihedral_style command before reading a data file that defines Dihedral Coeffs.

Must define dihedral_style before EndBondTorsion Coeffs  Must use a dihedral_style command before reading a data file that defines EndBondTorsion Coeffs.

Must define dihedral_style before MiddleBondTorsion Coeffs  Must use a dihedral_style command before reading a data file that defines MiddleBondTorsion Coeffs.

Must define improper_style before AngleAngle Coeffs  Must use an improper_style command before reading a data file that defines AngleAngle Coeffs.

Must define improper_style before Improper Coeffs  Must use an improper_style command before reading a data file that defines Improper Coeffs.

Must define pair_style before Pair Coeffs  Must use a pair_style command before reading a data file that defines Pair Coeffs.

Must define pair_style before PairIJ Coeffs  Must use a pair_style command before reading a data file that defines PairIJ Coeffs.

Must have more than one processor partition to temper  Cannot use the temper command with only one processor partition. Use the -partition command-line option.

Must not have multiple fixes change box parameter  .  .  .  Self-explanatory.

Must read Atoms before Angles  The Atoms section of a data file must come before an Angles section.

Must read Atoms before Bodies  The Atoms section of a data file must come before a Bodies section.

Must read Atoms before Bonds  The Atoms section of a data file must come before a Bonds section.

Must read Atoms before Dihedrals  The Atoms section of a data file must come before a Dihedrals section.

Must read Atoms before Ellipsoids  The Atoms section of a data file must come before a Ellipsoids section.

Must read Atoms before Impropers  The Atoms section of a data file must come before an Impropers section.

Must read Atoms before Lines  The Atoms section of a data file must come before a Lines section.

Must read Atoms before Triangles  The Atoms section of a data file must come before a Triangles section.

Must read Atoms before Velocities  The Atoms section of a data file must come before a Velocities section.

Must re-specify non-restarted pair style (xxx) after read_restart  For pair styles, that do not store their settings in a restart file, it must be defined with a new ’pair_style’ command after read_restart.

Must set both respa inner and outer  Cannot use just the inner or outer option with respa without using the other.

Must set number of threads via package omp command  Because you are using the USER-OMP package, set the number of threads via its settings, not by the pair_style snap nthreads setting.

12.4. Error messages
Must shrink-wrap piston boundary  The boundary style of the face where the piston is applied must be of type s (shrink-wrapped).

Must specify a region in fix deposit  The region keyword must be specified with this fix.

Must specify a region in fix pour  Self-explanatory.

Must specify at least 2 types in fix atom/swap command  Self-explanatory.

Must use ‘kim_style init’ command before simulation box is defined  Self-explanatory.

Must use ‘kim_style define’ command after simulation box is defined  Self-explanatory.

Must use ‘kim_style init’ command before ‘kim_style define’  Self-explanatory.

Must use ‘kspace_modify pressure/scalar no’ for rRESPA with kspace_style MSM  The kspace scalar pressure option cannot (yet) be used with rRESPA.

Must use ‘kspace_modify pressure/scalar no’ for tensor components with kspace_style msm  Otherwise MSM will compute only a scalar pressure. See the kspace_modify command for details on this setting.

Must use ‘kspace_modify pressure/scalar no’ to obtain per-atom virial with kspace_style MSM  The kspace scalar pressure option cannot be used to obtain per-atom virial.

Must use ‘kspace_modify pressure/scalar no’ with GPU MSM Pair styles  The kspace scalar pressure option is not (yet) compatible with GPU MSM Pair styles.

Must use ‘kspace_modify pressure/scalar no’ with kspace_style msm/cg  The kspace scalar pressure option is not compatible with kspace_style msm/cg.

Must use -in switch with multiple partitions  A multi-partition simulation cannot read the input script from stdin. The -in command-line option must be used to specify a file.

Must use Kokkos half/thread or full neighbor list with threads or GPUs  Using Kokkos half-neighbor lists with threading is not allowed.

Must use a block or cylinder region with fix pour  Self-explanatory.

Must use a block region with fix pour for 2d simulations  Self-explanatory.

Must use a bond style with TIP4P potential  TIP4P potentials assume bond lengths in water are constrained by a fix shake command.

Must use a molecular atom style with fix poems molecule  Self-explanatory.

Must use a z-axis cylinder region with fix pour  Self-explanatory.

Must use an angle style with TIP4P potential  TIP4P potentials assume angles in water are constrained by a fix shake command.

Must use atom map style array with Kokkos  See the atom_modify map command.

Must use atom style with molecule IDs with fix bond/swap  Self-explanatory.

Must use pair_style comb or comb3 with fix qeq/comb  Self-explanatory.

Must use variable energy with fix addforce  Must define an energy variable when applying a dynamic force during minimization.

Must use variable energy with fix efield  You must define an energy when performing a minimization with a variable E-field.

NEB command before simulation box is defined  Self-explanatory.

NEB requires damped dynamics minimizer  Use a different minimization style.

NEB requires use of fix neb  Self-explanatory.
NL ramp in wall/piston only implemented in zlo for now  The ramp keyword can only be used for piston applied to face zlo.

Need nswaptypes mu values in fix atom/swap command  Self-explanatory.

Needed bonus data not in data file  Some atom styles require bonus data. See the read_data doc page for details.

Needed molecular topology not in data file  The header of the data file indicated bonds, angles, etc would be included, but they are not present.

Neigh_modify exclude molecule requires atom attribute molecule  Self-explanatory.

Neigh_modify include group != atom_modify first group  Self-explanatory.

Neighbor delay must be 0 or multiple of every setting  The delay and every parameters set via the neigh_modify command are inconsistent. If the delay setting is non-zero, then it must be a multiple of the every setting.

Neighbor include group not allowed with ghost neighbors  This is a current restriction within LAMMPS.

Neighbor list overflow, boost neigh_modify one  There are too many neighbors of a single atom. Use the neigh_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

Neighbor multi not yet enabled for ghost neighbors  This is a current restriction within LAMMPS.

Neighbor multi not yet enabled for granular  Self-explanatory.

Neighbor multi not yet enabled for rRESPA  Self-explanatory.

Neighbor page size must be >= 10x the one atom setting  This is required to prevent wasting too much memory.

New atom IDs exceed maximum allowed ID  See the setting for tagint in the src/lmptype.h file.

New bond exceeded bonds per atom in create_bonds  See the read_data command for info on using the “extra/bond/per/atom” keyword to allow for additional bonds to be formed

New bond exceeded bonds per atom in fix bond/create  See the read_data command for info on using the “extra/bond/per/atom” keyword to allow for additional bonds to be formed

New bond exceeded special list size in fix bond/create  See the “read_data extra/special/per/atom” command (or the “create_box extra/special/per/atom” command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

Newton bond change after simulation box is defined  The newton command cannot be used to change the newton bond value after a read_data, read_restart, or create_box command.

Next command must list all universe and uloop variables  This is to insure they stay in sync.

No Kspace style defined for compute group/group  Self-explanatory.

No OpenMP support compiled in  An OpenMP flag is set, but LAMMPS was not built with OpenMP support.

No angle style is defined for compute angle/local  Self-explanatory.

No angles allowed with this atom style  Self-explanatory.

No atoms in data file  The header of the data file indicated that atoms would be included, but they are not present.

No basis atoms in lattice  Basis atoms must be defined for lattice style user.

No bodies allowed with this atom style  Self-explanatory. Check data file.

No bond style is defined for compute bond/local  Self-explanatory.

No bonds allowed with this atom style  Self-explanatory.

No box information in dump. You have to use ‘box no’  Self-explanatory.
No count or invalid atom count in molecule file  The number of atoms must be specified.

No dihedral style is defined for compute dihedral/local  Self-explanatory.

No dihedrals allowed with this atom style  Self-explanatory.

No dump custom arguments specified  The dump custom command requires that atom quantities be specified to output to dump file.

No dump local arguments specified  Self-explanatory.

No ellipsoids allowed with this atom style  Self-explanatory. Check data file.

No fix gravity defined for fix pour  Gravity is required to use fix pour.

No improper style is defined for compute improper/local  Self-explanatory.

No impropers allowed with this atom style  Self-explanatory.

No input values for fix ave/spatial  Self-explanatory.

No lines allowed with this atom style  Self-explanatory. Check data file.

No matching element in ADP potential file  The ADP potential file does not contain elements that match the requested elements.

No matching element in EAM potential file  The EAM potential file does not contain elements that match the requested elements.

No molecule topology allowed with atom style template  The data file cannot specify the number of bonds, angles, etc, because this info if inferred from the molecule templates.

No overlap of box and region for create_atoms  Self-explanatory.

No pair coul/streitz for fix qeq/slater  These commands must be used together.

No pair hbond/dreiding coefficients set  Self-explanatory.

No pair style defined for compute group/group  Cannot calculate group interactions without a pair style defined.

No pair style is defined for compute pair/local  Self-explanatory.

No pair style is defined for compute property/local  Self-explanatory.

No rigid bodies defined  The fix specification did not end up defining any rigid bodies.

No triangles allowed with this atom style  Self-explanatory. Check data file.

No values in fix ave/chunk command  Self-explanatory.

No values in fix ave/time command  Self-explanatory.

Non digit character between brackets in variable  Self-explanatory.

Non integer # of swaps in temper command  Swap frequency in temper command must evenly divide the total # of timesteps.

Non-numeric box dimensions - simulation unstable  The box size has apparently blown up.

Non-zero atom IDs with atom_modify id = no  Self-explanatory.

Non-zero read_data shift z value for 2d simulation  Self-explanatory.

Nprocs not a multiple of N for -reorder  Self-explanatory.

Number of core atoms != number of shell atoms  There must be a one-to-one pairing of core and shell atoms.

Numeric index is out of bounds  A command with an argument that specifies an integer or range of integers is using a value that is less than 1 or greater than the maximum allowed limit.
One or more Atom IDs is negative Atom IDs must be positive integers.

One or more atom IDs is too big The limit on atom IDs is set by the SMALLBIG, BIGBIG, SMALLSMALL setting in your LAMMPS build. See the Build settings doc page for more info.

One or more atom IDs is zero Either all atoms IDs must be zero or none of them.

One or more atoms belong to multiple rigid bodies Two or more rigid bodies defined by the fix rigid command cannot contain the same atom.

One or more rigid bodies are a single particle Self-explanatory.

One or zero atoms in rigid body Any rigid body defined by the fix rigid command must contain 2 or more atoms.

Only 2 types allowed when not using semi-grand in fix atom/swap command Self-explanatory.

Only one cut-off allowed when requesting all long Self-explanatory.

Only one cutoff allowed when requesting all long Self-explanatory.

Only zhi currently implemented for fix append/atoms Self-explanatory.

Out of range atoms - cannot compute MSM One or more atoms are attempting to map their charge to a MSM grid point that is not owned by a processor. This is likely for one of two reasons, both of them bad. First, it may mean that an atom near the boundary of a processor’s sub-domain has moved more than 1/2 the neighbor skin distance without neighbor lists being rebuilt and atoms being migrated to new processors. This also means you may be missing pairwise interactions that need to be computed. The solution is to change the re-neighboring criteria via the neigh_modify command. The safest settings are “delay 0 every 1 check yes”. Second, it may mean that an atom has moved far outside a processor’s sub-domain or even the entire simulation box. This indicates bad physics, e.g. due to highly overlapping atoms, too large a timestep, etc.

Out of range atoms - cannot compute PPPM One or more atoms are attempting to map their charge to a PPPM grid point that is not owned by a processor. This is likely for one of two reasons, both of them bad. First, it may mean that an atom near the boundary of a processor’s sub-domain has moved more than 1/2 the neighbor skin distance without neighbor lists being rebuilt and atoms being migrated to new processors. This also means you may be missing pairwise interactions that need to be computed. The solution is to change the re-neighboring criteria via the neigh_modify command. The safest settings are “delay 0 every 1 check yes”. Second, it may mean that an atom has moved far outside a processor’s sub-domain or even the entire simulation box. This indicates bad physics, e.g. due to highly overlapping atoms, too large a timestep, etc.

Out of range atoms - cannot compute PPPMDisp One or more atoms are attempting to map their charge to a PPPM grid point that is not owned by a processor. This is likely for one of two reasons, both of them bad. First, it may mean that an atom near the boundary of a processor’s sub-domain has moved more than 1/2 the neighbor skin distance without neighbor lists being rebuilt and atoms being migrated to new processors. This also means you may be missing pairwise interactions that need to be computed. The solution is to change the re-neighboring criteria via the neigh_modify command. The safest settings are “delay 0 every 1 check yes”. Second, it may mean that an atom has moved far outside a processor’s sub-domain or even the entire simulation box. This indicates bad physics, e.g. due to highly overlapping atoms, too large a timestep, etc.

Overflow of allocated fix vector storage This should not normally happen if the fix correctly calculated how long the vector will grow to. Contact the developers.

Overlapping large/large in pair colloid This potential is infinite when there is an overlap.

Overlapping small/large in pair colloid This potential is infinite when there is an overlap.

POEMS fix must come before NPT/NPH fix NPT/NPH fix must be defined in input script after all poems fixes, else the fix contribution to the pressure virial is incorrect.

PPPMD can only currently be used with comm_style brick This is a current restriction in LAMMPS.

PPPMD grid is too large The global PPPMD grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.
PPPM grid stencil extends beyond nearest neighbor processor  This is not allowed if the kspace_modify overlap setting is no.

PPPM order < minimum allowed order  The default minimum order is 2. This can be reset by the kspace_modify minorder command.

PPPM order cannot be < 2 or > than %d  This is a limitation of the PPPM implementation in LAMMPS.

PPPMDisp Coulomb grid is too large  The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPMDisp Dispersion grid is too large  The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPMDisp can only currently be used with comm_style brick  This is a current restriction in LAMMPS.

PPPMDisp coulomb order cannot be greater than %d  This is a limitation of the PPPM implementation in LAMMPS.

PPPMDisp used but no parameters set, for further information please see the pppm/disp documentation  An efficient and accurate usage of the pppm/disp requires settings via the kspace_modify command. Please see the pppm/disp documentation for further instructions.

PRD command before simulation box is defined  The prd command cannot be used before a read_data, read_restart, or create_box command.

PRD nsteps must be multiple of t_event  Self-explanatory.

PRD t_corr must be multiple of t_event  Self-explanatory.

Package command after simulation box is defined  The package command cannot be used after a read_data, read_restart, or create_box command.

Package gpu command without GPU package installed  The GPU package must be installed via “make yes-gpu” before LAMMPS is built.

Package intel command without USER-INTEL package installed  The USER-INTEL package must be installed via “make yes-user-intel” before LAMMPS is built.

Package kokkos command without KOKKOS package enabled  The KOKKOS package must be installed via “make yes-kokkos” before LAMMPS is built, and the “-k on” must be used to enable the package.

Package omp command without USER-OMP package installed  The USER-OMP package must be installed via “make yes-user-omp” before LAMMPS is built.

Pair body requires atom style body  Self-explanatory.

Pair body requires body style nparticle  This pair style is specific to the nparticle body style.

Pair brownian requires atom style sphere  Self-explanatory.

Pair brownian requires extended particles  One of the particles has radius 0.0.

Pair brownian requires monodisperse particles  All particles must be the same finite size.

Pair brownian/poly requires atom style sphere  Self-explanatory.

Pair brownian/poly requires extended particles  One of the particles has radius 0.0.

Pair brownian/poly requires newton pair off  Self-explanatory.

Pair coeff for hybrid has invalid style  Style in pair coeff must have been listed in pair_style command.

Pair coul/wolf requires atom attribute q  The atom style defined does not have this attribute.

Pair cutoff < Respa interior cutoff  One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.
Pair dipole/cut requires atom attributes q, mu, torque The atom style defined does not have these attributes.
Pair dipole/cut/gpu requires atom attributes q, mu, torque The atom style defined does not have this attribute.
Pair dipole/long requires atom attributes q, mu, torque The atom style defined does not have these attributes.
Pair dipole/sf/gpu requires atom attributes q, mu, torque The atom style defined does not one or more of these attributes.

Pair distance < table inner cutoff Two atoms are closer together than the pairwise table allows.
Pair distance > table outer cutoff Two atoms are further apart than the pairwise table allows.
Pair dpd requires ghost atoms store velocity Use the comm_modify vel yes command to enable this.
Pair gayberne epsilon a,b,c coeffs are not all set Each atom type involved in pair_style gayberne must have these 3 coefficients set at least once.
Pair gayberne requires atom style ellipsoid Self-explanatory.
Pair gayberne requires atoms with same type have same shape Self-explanatory.
Pair gayberne/gpu requires atom style ellipsoid Self-explanatory.
Pair gayberne/gpu requires atoms with same type have same shape Self-explanatory.
Pair granular requires atom attributes radius, rmass The atom style defined does not have these attributes.
Pair granular requires ghost atoms store velocity Use the comm_modify vel yes command to enable this.
Pair granular with shear history requires newton pair off This is a current restriction of the implementation of pair granular styles with history.
Pair hybrid single calls do not support per sub-style special bond values Self-explanatory.
Pair hybrid sub-style does not support single call You are attempting to invoke a single() call on a pair style that does not support it.
Pair hybrid sub-style is not used No pair_coeff command used a sub-style specified in the pair_style command.
Pair inner cutoff < Respa interior cutoff One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.
Pair inner cutoff >= Pair outer cutoff The specified cutoffs for the pair style are inconsistent.
Pair line/lj requires atom style line Self-explanatory.
Pair lj/long/dipole/long requires atom attributes mu, torque The atom style defined does not have these attributes.
Pair lubricate requires atom style sphere Self-explanatory.
Pair lubricate requires ghost atoms store velocity Use the comm_modify vel yes command to enable this.
Pair lubricate requires monodisperse particles All particles must be the same finite size.
Pair lubricate/poly requires atom style sphere Self-explanatory.
Pair lubricate/poly requires extended particles One of the particles has radius 0.0.
Pair lubricate/poly requires ghost atoms store velocity Use the comm_modify vel yes command to enable this.
Pair lubricate/poly requires newton pair off Self-explanatory.
Pair lubricateU requires atom style sphere Self-explanatory.
Pair lubricateU requires ghost atoms store velocity Use the comm_modify vel yes command to enable this.
Pair lubricateU requires monodisperse particles All particles must be the same finite size.
Pair lubricateU/poly requires ghost atoms store velocity Use the comm_modify vel yes command to enable this.
Pair lubricateU/poly requires newton pair off  Self-explanatory.
Pair peri lattice is not identical in x, y, and z  The lattice defined by the lattice command must be cubic.
Pair peri requires a lattice be defined  Use the lattice command for this purpose.
Pair peri requires an atom map, see atom_modify  Even for atomic systems, an atom map is required to find Peridynamic bonds. Use the atom_modify command to define one.
Pair resquared epsilon a,b,c coeffs are not all set  Self-explanatory.
Pair resquared epsilon and sigma coeffs are not all set  Self-explanatory.
Pair resquared requires atom style ellipsoid  Self-explanatory.
Pair resquared/gpu requires atoms with same type have same shape  Self-explanatory.
Pair style AIREBO requires atom IDs  This is a requirement to use the AIREBO potential.
Pair style AIREBO requires newton pair on  See the newton command. This is a restriction to use the AIREBO potential.
Pair style BOP requires atom IDs  This is a requirement to use the BOP potential.
Pair style BOP requires newton pair on  See the newton command. This is a restriction to use the BOP potential.
Pair style COMB requires atom IDs  This is a requirement to use the AIREBO potential.
Pair style COMB requires atom attribute q  Self-explanatory.
Pair style COMB requires newton pair on  See the newton command. This is a restriction to use the COMB potential.
Pair style COMB3 requires atom IDs  This is a requirement to use the COMB3 potential.
Pair style COMB3 requires atom attribute q  Self-explanatory.
Pair style COMB3 requires newton pair on  See the newton command. This is a restriction to use the COMB3 potential.
Pair style LCBOP requires atom IDs  This is a requirement to use the LCBOP potential.
Pair style LCBOP requires newton pair on  See the newton command. This is a restriction to use the Tersoff potential.
Pair style MEAM requires newton pair on  See the newton command. This is a restriction to use the MEAM potential.
Pair style SNAP requires newton pair on  See the newton command. This is a restriction to use the SNAP potential.
Pair style Stillinger-Weber requires atom IDs  This is a requirement to use the SW potential.
Pair style Stillinger-Weber requires newton pair on  See the newton command. This is a restriction to use the SW potential.
Pair style Tersoff requires atom IDs  This is a requirement to use the Tersoff potential.
Pair style Tersoff requires newton pair on  See the newton command. This is a restriction to use the Tersoff potential.
Pair style Vashishta requires atom IDs  This is a requirement to use the Vashishta potential.
Pair style Vashishta requires newton pair on  See the newton command. This is a restriction to use the Vashishta potential.
Pair style bop requires comm ghost cutoff at least 3x larger than %g  Use the communicate ghost command to set this. See the pair bop doc page for more details.
Pair style born/coul/long requires atom attribute \( q \)  An atom style that defines this attribute must be used.
Pair style born/coul/long/gpu requires atom attribute \( q \)  The atom style defined does not have this attribute.
Pair style buck/coul/wolf requires atom attribute \( q \)  The atom style defined does not have this attribute.
Pair style buck/coul/cut requires atom attribute \( q \)  The atom style defined does not have this attribute.
Pair style buck/coul/long requires atom attribute \( q \)  The atom style defined does not have these attributes.
Pair style buck/coul/gpu requires atom attribute \( q \)  The atom style defined does not have this attribute.
Pair style buck/long/coul/long requires atom attribute \( q \)  The atom style defined does not have this attribute.
Pair style coul/cut requires atom attribute \( q \)  The atom style defined does not have these attributes.
Pair style coul/cut/gpu requires atom attribute \( q \)  The atom style defined does not have this attribute.
Pair style coul/debye/gpu requires atom attribute \( q \)  The atom style defined does not have this attribute.
Pair style coul/dsf requires atom attribute \( q \)  The atom style defined does not have this attribute.
Pair style coul/dsf/gpu requires atom attribute \( q \)  The atom style defined does not have this attribute.
Pair style coul/long/gpu requires atom attribute \( q \)  The atom style defined does not have these attributes.
Pair style coul/streitz requires atom attribute \( q \)  Self-explanatory.
Pair style does not have extra field requested by compute pair/local  The pair style does not support the \( pN \) value requested by the compute pair/local command.
Pair style does not support bond_style quartic  The pair style does not have a single() function, so it cannot be invoked by bond_style quartic.
Pair style does not support compute group/group  The pair style does not have a single() function, so it cannot be invoked by the compute group/group command.
Pair style does not support compute pair/local  The pair style does not have a single() function, so it cannot be invoked by compute pair/local.
Pair style does not support compute property/local  The pair style does not have a single() function, so it cannot be invoked by fix bond/swap.
Pair style does not support fix bond/swap  The pair style does not have a single() function, so it cannot be invoked by fix bond/swap.
Pair style does not support pair_write  The pair style does not have a single() function, so it cannot be invoked by pair_write.
Pair style does not support rRESPA inner/middle/outer  You are attempting to use rRESPA options with a pair style that does not support them.
Pair style granular with history requires atoms have IDs  Atoms in the simulation do not have IDs, so history effects cannot be tracked by the granular pair potential.
Pair style hbond/dreiding requires an atom map, see atom_modify  Self-explanatory.
Pair style hbond/dreiding requires atom IDs  Self-explanatory.
Pair style hbond/dreiding requires molecular system  Self-explanatory.
Pair style hbond/dreiding requires newton pair on  See the newton command for details.
Pair style hybrid cannot have hybrid as an argument  Self-explanatory.
Pair style hybrid cannot have none as an argument  Self-explanatory.
**Pair style is incompatible with KSpace style** If a pair style with a long-range Coulombic component is selected, then a kspace style must also be used.

**Pair style is incompatible with TIP4P KSpace style** The pair style does not have the requires TIP4P settings.

**Pair style lj/charmm/coul/charmm requires atom attribute q** The atom style defined does not have these attributes.

**Pair style lj/charmm/coul/long requires atom attribute q** The atom style defined does not have these attributes.

**Pair style lj/charmm/coul/long/gpu requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/class2/coul/cut requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/class2/coul/long requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/class2/coul/long/gpu requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/cut/coul requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/cut/coul/cut/gpu requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/cut/coul/debye/gpu requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/cut/dsf requires atom attribute q** The atom style defined does not have these attributes.

**Pair style lj/cut/dsf/gpu requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/cut/long requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/cut/long/gpu requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/cut/tip4p/cut requires atom attribute q** The atom style defined does not have this attribute.

**Pair style lj/cut/tip4p/cut requires newton pair on** See the newton command. This is a restriction to use this potential.

**Pair style lj/cut/tip4p/long requires atom IDs** There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

**Pair style lj/cut/tip4p/long requires atom attribute q** The atom style defined does not have these attributes.

**Pair style lj/cut/tip4p/long requires newton pair on** This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

**Pair style lj/gromacs/coul/gromacs requires atom attribute q** An atom_style with this attribute is needed.

**Pair style lj/dipole/long does not currently support respa** This feature is not yet supported.

**Pair style lj/dipole/long requires atom IDs** There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

**Pair style lj/dipole/long requires atom attribute q** The atom style defined does not have these attributes.

**Pair style lj/sdk/coul/long/gpu requires atom attribute q** The atom style defined does not have this attribute.

**Pair style nb3b/harmonic requires atom IDs** This is a requirement to use this potential.

**Pair style nb3b/harmonic requires newton pair on** See the newton command. This is a restriction to use this potential.

**Pair style rmn/cut/coul/cut requires atom attribute q** The atom style defined does not have this attribute.

**Pair style rmn/cut/coul/long requires atom attribute q** The atom style defined does not have this attribute.

**Pair style peri requires atom style peri** Self-explanatory.
Pair style polymorphic requires atom IDs  This is a requirement to use the polymorphic potential.

Pair style polymorphic requires newton pair on  See the newton command. This is a restriction to use the polymorphic potential.

Pair style reax requires atom IDs  This is a requirement to use the ReaxFF potential.

Pair style reax requires atom attribute q  The atom style defined does not have this attribute.

Pair style reax requires newton pair on  This is a requirement to use the ReaxFF potential.

Pair style requires a KSpace style  No kspace style is defined.

Pair style requires use of kspace_style ewald/disp  Self-explanatory.

Pair style sw/gpu requires atom IDs  This is a requirement to use this potential.

Pair style sw/gpu requires newton pair off  See the newton command. This is a restriction to use this potential.

Pair style vashishta/gpu requires atom IDs  This is a requirement to use this potential.

Pair style vashishta/gpu requires newton pair off  See the newton command. This is a restriction to use this pair style.

Pair style tersoff/gpu requires atom IDs  This is a requirement to use the tersoff/gpu potential.

Pair style tersoff/gpu requires newton pair off  See the newton command. This is a restriction to use this pair style.

Pair style tip4p/cut requires atom IDs  This is a requirement to use this potential.

Pair style tip4p/cut requires atom attribute q  The atom style defined does not have this attribute.

Pair style tip4p/cut requires newton pair on  See the newton command. This is a restriction to use this potential.

Pair style tip4p/long requires atom IDs  There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style tip4p/long requires atom attribute q  The atom style defined does not have these attributes.

Pair style tip4p/long requires newton pair on  This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair table cutoffs must all be equal to use with KSpace  When using pair style table with a long-range KSpace solver, the cutoffs for all atom type pairs must all be the same, since the long-range solver starts at that cutoff.

Pair table parameters did not set N  List of pair table parameters must include N setting.

Pair tersoff/zbl requires metal or real units  This is a current restriction of this pair potential.

Pair tersoff/zbl/kk requires metal or real units  This is a current restriction of this pair potential.

Pair tri/lj requires atom style tri  Self-explanatory.

Pair yukawa/colloid requires atom style sphere  Self-explanatory.

Pair yukawa/colloid requires atoms with same type have same radius  Self-explanatory.

Pair yukawa/colloid/gpu requires atom style sphere  Self-explanatory.

Pair KIM only works with 3D problems  This is a current limitation.

Pair_coeff command before pair_style is defined  Self-explanatory.

Pair_coeff command before simulation box is defined  The pair_coeff command cannot be used before a read_data, read_restart, or create_box command.

Pair_modify command before pair_style is defined  Self-explanatory.

Pair_modify special setting for pair hybrid incompatible with global special_bonds setting  Cannot override a setting of 0.0 or 1.0 or change a setting between 0.0 and 1.0.
Pair_write command before pair_style is defined  Self-explanatory.

Particle on or inside fix wall surface  Particles must be “exterior” to the wall in order for energy/force to be calculated.

Particle outside surface of region used in fix wall/region  Particles must be inside the region for energy/force to be calculated. A particle outside the region generates an error.

Per-atom compute in equal-style variable formula  Equal-style variables cannot use per-atom quantities.

Per-atom energy was not tallied on needed timestep  You are using a thermo keyword that requires potentials to have tallied energy, but they did not on this timestep. See the variable doc page for ideas on how to make this work.

Per-atom fix in equal-style variable formula  Equal-style variables cannot use per-atom quantities.

Per-atom virial was not tallied on needed timestep  You are using a thermo keyword that requires potentials to have tallied the virial, but they did not on this timestep. See the variable doc page for ideas on how to make this work.

Per-processor system is too big  The number of owned atoms plus ghost atoms on a single processor must fit in 32-bit integer.

Potential energy ID for fix neb does not exist  Self-explanatory.

Potential energy ID for fix nvt/nph/npt does not exist  A compute for potential energy must be defined.

Potential file has duplicate entry  The potential file has more than one entry for the same element.

Potential file is missing an entry  The potential file does not have a needed entry.

Power by 0 in variable formula  Self-explanatory.

Pressure ID for fix box/relax does not exist  The compute ID needed to compute pressure for the fix does not exist.

Pressure ID for fix modify does not exist  Self-explanatory.

Pressure ID for fix npt/nph does not exist  Self-explanatory.

Pressure ID for fix press/berendsen does not exist  The compute ID needed to compute pressure for the fix does not exist.

Pressure ID for fix rigid npt/nph does not exist  Self-explanatory.

Pressure ID for thermo does not exist  The compute ID needed to compute pressure for thermodynamics does not exist.

Pressure control can not be used with fix nvt  Self-explanatory.

Pressure control can not be used with fix nvt/asphere  Self-explanatory.

Pressure control can not be used with fix nvt/body  Self-explanatory.

Pressure control can not be used with fix nvt/sllod  Self-explanatory.

Pressure control can not be used with fix nvt/sphere  Self-explanatory.

Pressure control must be used with fix nph  Self-explanatory.

Pressure control must be used with fix nph/asphere  Self-explanatory.

Pressure control must be used with fix nph/body  Self-explanatory.

Pressure control must be used with fix nph/small  Self-explanatory.

Pressure control must be used with fix nph/sphere  Self-explanatory.

Pressure control must be used with fix nphug  A pressure control keyword (iso, aniso, tri, x, y, or z) must be provided.

Pressure control must be used with fix npt  Self-explanatory.
Pressure control must be used with fix npt/asphere  Self-explanatory.
Pressure control must be used with fix npt/body  Self-explanatory.
Pressure control must be used with fix npt/sphere  Self-explanatory.
Processor count in z must be 1 for 2d simulation  Self-explanatory.
Processor partitions do not match number of allocated processors  The total number of processors in all partitions must match the number of processors LAMMPS is running on.
Processors command after simulation box is defined  The processors command cannot be used after a read_data, read_restart, or create_box command.
Processors custom grid file is inconsistent  The values in the custom file are not consistent with the number of processors you are running on or the Px,Py,Pz settings of the processors command. Or there was not a setting for every processor.
Processors grid numa and map style are incompatible  Using numa for gstyle in the processors command requires using cart for the map option.
Processors part option and grid style are incompatible  Cannot use gstyle numa or custom with the part option.
Processors twogrid requires proc count be a multiple of core count  Self-explanatory.
Pstart and Pstop must have the same value  Self-explanatory.
Python function evaluation failed  The Python function did not run successfully and/or did not return a value (if it is supposed to return a value). This is probably due to some error condition in the function.
Python function is not callable  The provided Python code was run successfully, but it not define a callable function with the required name.
Python invoke of undefined function  Cannot invoke a function that has not been previously defined.
Python variable does not match Python function  This matching is defined by the python-style variable and the python command.
Python variable has no function  No python command was used to define the function associated with the python-style variable.
QEQ with ‘newton pair off’ not supported  See the newton command. This is a restriction to use the QEQ fixes.
R0 < 0 for fix spring command  Equilibrium spring length is invalid.
RATTLE coordinate constraints are not satisfied up to desired tolerance  Self-explanatory.
RATTLE determinant = 0.0  The determinant of the matrix being solved for a single cluster specified by the fix rattle command is numerically invalid.
RATTLE failed  Certain constraints were not satisfied.
RATTLE velocity constraints are not satisfied up to desired tolerance  Self-explanatory.
Read data add offset is too big  It cannot be larger than the size of atom IDs, e.g. the maximum 32-bit integer.
Read dump of atom property that is not allocated  Self-explanatory.
Read rerun dump file timestep > specified stop  Self-explanatory.
Read restart MPI-IO input not allowed with % in filename  This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.
Read_data shrink wrap did not assign all atoms correctly  This is typically because the box-size specified in the data file is large compared to the actual extent of atoms in a shrink-wrapped dimension. When LAMMPS shrink-wraps the box atoms will be lost if the processor they are re-assigned to is too far away. Choose a box size closer to the actual extent of the atoms.
Read_dump command before simulation box is defined  The read_dump command cannot be used before a read_data, read_restart, or create_box command.

Read_dump field not found in dump file  Self-explanatory.

Read_dump triclinic status does not match simulation  Both the dump snapshot and the current LAMMPS simulation must be using either an orthogonal or triclinic box.

Read_dump xyz fields do not have consistent scaling/wrapping  Self-explanatory.

Reading from MPI-IO filename when MPIIO package is not installed  Self-explanatory.

Reax_defs.h setting for NATDEF is too small  Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

Reax_defs.h setting for NNEIGHMAXDEF is too small  Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

Receiving partition in processors part command is already a receiver  Cannot specify a partition to be a receiver twice.

Region ID for compute chunk/atom does not exist  Self-explanatory.

Region ID for compute reduce/region does not exist  Self-explanatory.

Region ID for compute temp/region does not exist  Self-explanatory.

Region ID for dump custom does not exist  Self-explanatory.

Region ID for fix addforce does not exist  Self-explanatory.

Region ID for fix atom/swap does not exist  Self-explanatory.

Region ID for fix ave/spatial does not exist  Self-explanatory.

Region ID for fix aveforce does not exist  Self-explanatory.

Region ID for fix deposit does not exist  Self-explanatory.

Region ID for fix efield does not exist  Self-explanatory.

Region ID for fix evaporate does not exist  Self-explanatory.

Region ID for fix gcmc does not exist  Self-explanatory.

Region ID for fix heat does not exist  Self-explanatory.

Region ID for fix setforce does not exist  Self-explanatory.

Region ID for fix wall/region does not exist  Self-explanatory.

Region ID for group dynamic does not exist  Self-explanatory.

Region ID in variable formula does not exist  Self-explanatory.

Region cannot have 0 length rotation vector  Self-explanatory.

Region for fix oneway does not exist  Self-explanatory.

Region intersect region ID does not exist  Self-explanatory.

Region union or intersect cannot be dynamic  The sub-regions can be dynamic, but not the combined region.

Region union region ID does not exist  One or more of the region IDs specified by the region union command does not exist.

Replacing a fix, but new style != old style  A fix ID can be used a second time, but only if the style matches the previous fix. In this case it is assumed you with to reset a fix’s parameters. This error may mean you are mistakenly re-using a fix ID when you do not intend to.
Replicate command before simulation box is defined  The replicate command cannot be used before a read_data, read_restart, or create_box command.

Replicate did not assign all atoms correctly  Atoms replicated by the replicate command were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box.

Replicated system atom IDs are too big  See the setting for tagint in the src/lmptype.h file.

Replicated system is too big  See the setting for bigint in the src/lmptype.h file.

Required border comm not yet implemented with Kokkos  There are various limitations in the communication options supported by Kokkos.

Rerun command before simulation box is defined  The rerun command cannot be used before a read_data, read_restart, or create_box command.

Rerun dump file does not contain requested snapshot  Self-explanatory.

Resetting timestep size is not allowed with fix move  This is because fix move is moving atoms based on elapsed time.

Respa inner cutoffs are invalid  The first cutoff must be <= the second cutoff.

Respa levels must be >= 1  Self-explanatory.

Respa middle cutoffs are invalid  The first cutoff must be <= the second cutoff.

Restart file MPI-IO output not allowed with % in filename  This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

Restart file byte ordering is not recognized  The file does not appear to be a LAMMPS restart file since it does not contain a recognized byte-ordering flag at the beginning.

Restart file byte ordering is swapped  The file was written on a machine with different byte-ordering than the machine you are reading it on. Convert it to a text data file instead, on the machine you wrote it on.

Restart file incompatible with current version  This is probably because you are trying to read a file created with a version of LAMMPS that is too old compared to the current version. Use your older version of LAMMPS and convert the restart file to a data file.

Restart file is a MPI-IO file  The file is inconsistent with the filename you specified for it.

Restart file is a multi-proc file  The file is inconsistent with the filename you specified for it.

Restart file is not a MPI-IO file  The file is inconsistent with the filename you specified for it.

Restart file is not a multi-proc file  The file is inconsistent with the filename you specified for it.

Restart variable returned a bad timestep  The variable must return a timestep greater than the current timestep.

Restrain atoms %d %d %d %d missing on proc %d at step %ld  The 4 atoms in a restrain dihedral specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Restrain atoms %d %d %d %d missing on proc %d at step %ld  The 3 atoms in a restrain angle specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Restrain atoms %d %d %d missing on proc %d at step %ld  The 2 atoms in a restrain bond specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Reuse of compute ID  A compute ID cannot be used twice.

Reuse of dump ID  A dump ID cannot be used twice.

Reuse of molecule template ID  The template IDs must be unique.

Reuse of region ID  A region ID cannot be used twice.
Rigid body atoms %d %d missing on proc %d at step %ld This means that an atom cannot find the atom that owns the rigid body it is part of, or vice versa. The solution is to use the communicate cutoff command to insures that all ghost atoms are acquired from far enough away to encompass the max distance printed when the fix rigid/small command was invoked.

Rigid body has degenerate moment of inertia Fix poems will only work with bodies (collections of atoms) that have non-zero principal moments of inertia. This means they must be 3 or more non-collinear atoms, even with joint atoms removed.

Rigid fix must come before NPT/NPH fix NPT/NPH fix must be defined in input script after all rigid fixes, else the rigid fix contribution to the pressure virial is incorrect.

Rmask function in equal-style variable formula Rmask is per-atom operation.

Run command before simulation box is defined The run command cannot be used before a read_data, read_restart, or create_box command.

Run command start value is after start of run Self-explanatory.

Run command stop value is before end of run Self-explanatory.

Run_style command before simulation box is defined The run_style command cannot be used before a read_data, read_restart, or create_box command.

SRD bin size for fix srd differs from user request Fix SRD had to adjust the bin size to fit the simulation box. See the cubic keyword if you want this message to be an error vs warning.

SRD bins for fix srd are not cubic enough The bin shape is not within tolerance of cubic. See the cubic keyword if you want this message to be an error vs warning.

SRD particle %d started inside big particle %d on step %ld bounce %d See the inside keyword if you want this message to be an error vs warning.

SRD particle %d started inside wall %d on step %ld bounce %d See the inside keyword if you want this message to be an error vs warning.

Same dimension twice in fix ave/spatial Self-explanatory.

Sending partition in processors part command is already a sender Cannot specify a partition to be a sender twice.

Set command before simulation box is defined The set command cannot be used before a read_data, read_restart, or create_box command.

Set command floating point vector does not exist Self-explanatory.

Set command integer vector does not exist Self-explanatory.

Set command with no atoms existing No atoms are yet defined so the set command cannot be used.

Set region ID does not exist Region ID specified in set command does not exist.

Shake angles have different bond types All 3-atom angle-constrained SHAKE clusters specified by the fix shake command that are the same angle type, must also have the same bond types for the 2 bonds in the angle.

Shake atoms %d %d %d %d missing on proc %d at step %ld The 4 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake atoms %d %d %d %d missing on proc %d at step %ld The 3 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake atoms %d %d missing on proc %d at step %ld The 2 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake cluster of more than 4 atoms A single cluster specified by the fix shake command can have no more than 4 atoms.
**Shake clusters are connected**  A single cluster specified by the fix shake command must have a single central atom with up to 3 other atoms bonded to it.

**Shake determinant = 0.0**  The determinant of the matrix being solved for a single cluster specified by the fix shake command is numerically invalid.

**Shake fix must come before NPT/NPH fix**  NPT fix must be defined in input script after SHAKE fix, else the SHAKE fix contribution to the pressure virial is incorrect.

**Shear history overflow, boost neigh_modify one**  There are too many neighbors of a single atom. Use the neigh_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

**Small to big integers are not sized correctly**  This error occurs when the sizes of smallint, imageint, tagint, bigint, as defined in src/lmptype.h are not what is expected. Contact the developers if this occurs.

**Smallint setting in lmptype.h is invalid**  It has to be the size of an integer.

**Smallint setting in lmptype.h is not compatible**  Smallint stored in restart file is not consistent with LAMMPS version you are running.

**Special list size exceeded in fix bond/create**  See the “read_data extra/special/per/atom” command (or the “create_box extra/special/per/atom” command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

**Species XXX is not supported by this KIM Simulator Model**  The kim_style define command was referencing a species that is not present in the requested KIM Simulator Model.

**Specified processors != physical processors**  The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

**Specified target stress must be uniaxial or hydrostatic**  Self-explanatory.

**Sqrt of negative value in variable formula**  Self-explanatory.

**Subsequent read data induced too many angles per atom**  See the extra/angle/per/atom keyword for the create_box or the read_data command to set this limit larger.

**Subsequent read data induced too many bonds per atom**  See the extra/bond/per/atom keyword for the create_box or the read_data command to set this limit larger.

**Subsequent read data induced too many dihedrals per atom**  See the extra/dihedral/per/atom keyword for the create_box or the read_data command to set this limit larger.

**Subsequent read data induced too many impropers per atom**  See the extra/improper/per/atom keyword for the create_box or the read_data command to set this limit larger.

**Substitution for illegal variable**  Input script line contained a variable that could not be substituted for.

**Support for writing images in JPEG format not included**  LAMMPS was not built with the -DLAMMPS_JPEG switch in the Makefile.

**Support for writing images in PNG format not included**  LAMMPS was not built with the -DLAMMPS_PNG switch in the Makefile.

**Support for writing movies not included**  LAMMPS was not built with the -DLAMMPS_FFMPEG switch in the Makefile.

**System in data file is too big**  See the setting for bigint in the src/lmptype.h file.

**System is not charge neutral, net charge = %g**  The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is an error.

**TAD nsteps must be multiple of t_event**  Self-explanatory.
**TIP4P hydrogen has incorrect atom type**  The TIP4P pairwise computation found an H atom whose type does not agree with the specified H type.

**TIP4P hydrogen is missing**  The TIP4P pairwise computation failed to find the correct H atom within a water molecule.

**TMD target file did not list all group atoms**  The target file for the fix tmd command did not list all atoms in the fix group.

**Tad command before simulation box is defined**  Self-explanatory.

**Tagint setting in lmptype.h is invalid**  Tagint must be as large or larger than smallint.

**Tagint setting in lmptype.h is not compatible**  Format of tagint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

**Target pressure for fix rigid/nph cannot be < 0.0**  Self-explanatory.

**Target pressure for fix rigid/npt/small cannot be < 0.0**  Self-explanatory.

**Target temperature for fix nvt/npt/nph cannot be 0.0**  Self-explanatory.

**Target temperature for fix rigid/npt cannot be 0.0**  Self-explanatory.

**Target temperature for fix rigid/npt/small cannot be 0.0**  Self-explanatory.

**Target temperature for fix rigid/nvt cannot be 0.0**  Self-explanatory.

**Target temperature for fix rigid/nvt/small cannot be 0.0**  Self-explanatory.

**Temper command before simulation box is defined**  The temper command cannot be used before a read_data, read_restart, or create_box command.

**Temperature ID for fix bond/swap does not exist**  Self-explanatory.

**Temperature ID for fix box/relax does not exist**  Self-explanatory.

**Temperature ID for fix nvt/npt does not exist**  Self-explanatory.

**Temperature ID for fix press/berendsen does not exist**  Self-explanatory.

**Temperature ID for fix rigid nvt/npt/nph does not exist**  Self-explanatory.

**Temperature ID for fix temp/berendsen does not exist**  Self-explanatory.

**Temperature ID for fix temp/csl does not exist**  Self-explanatory.

**Temperature ID for fix temp/csvr does not exist**  Self-explanatory.

**Temperature ID for fix temp/rescale does not exist**  Self-explanatory.

**Temperature compute degrees of freedom < 0**  This should not happen if you are calculating the temperature on a valid set of atoms.

**Temperature control can not be used with fix nph**  Self-explanatory.

**Temperature control can not be used with fix nph/asphere**  Self-explanatory.

**Temperature control can not be used with fix nph/body**  Self-explanatory.

**Temperature control can not be used with fix nph/sphere**  Self-explanatory.

**Temperature control must be used with fix nphug**  The temp keyword must be provided.

**Temperature control must be used with fix npt**  Self-explanatory.

**Temperature control must be used with fix npt/asphere**  Self-explanatory.

**Temperature control must be used with fix npt/body**  Self-explanatory.
Temperature control must be used with fix npt/sphere Self-explanatory.
Temperature control must be used with fix nvt Self-explanatory.
Temperature control must be used with fix nvt/asphere Self-explanatory.
Temperature control must be used with fix nvt/body Self-explanatory.
Temperature control must be used with fix nvt/sllod Self-explanatory.
Temperature control must be used with fix nvt/sphere Self-explanatory.
Temperature control must not be used with fix nph/small Self-explanatory.
Temperature for fix nvt/sllod does not have a bias The specified compute must compute temperature with a bias.
Tempering could not find thermo_pe compute This compute is created by the thermo command. It must have been explicitly deleted by a uncompute command.
Tempering fix ID is not defined The fix ID specified by the temper command does not exist.
Tempering temperature fix is not valid The fix specified by the temper command is not one that controls temperature (nvt or langevin).
Test descriptor string already allocated This is an internal error. Contact the developers.
The package gpu command is required for gpu styles Self-explanatory.
Thermo and fix not computed at compatible times Fixes generate values on specific timesteps. The thermo output does not match these timesteps.
Thermo compute array is accessed out-of-range Self-explanatory.
Thermo compute does not compute array Self-explanatory.
Thermo compute does not compute scalar Self-explanatory.
Thermo compute does not compute vector Self-explanatory.
Thermo compute vector is accessed out-of-range Self-explanatory.
Thermo custom variable cannot be indexed Self-explanatory.
Thermo custom variable is not equal-style variable Only equal-style variables can be output with thermodynamics, not atom-style variables.
Thermo every variable returned a bad timestep The variable must return a timestep greater than the current timestep.
Thermo fix array is accessed out-of-range Self-explanatory.
Thermo fix does not compute array Self-explanatory.
Thermo fix does not compute scalar Self-explanatory.
Thermo fix does not compute vector Self-explanatory.
Thermo fix vector is accessed out-of-range Self-explanatory.
Thermo keyword in variable requires thermo to use/init pe You are using a thermo keyword in a variable that requires potential energy to be calculated, but your thermo output does not use it. Add it to your thermo output.
Thermo keyword in variable requires thermo to use/init press You are using a thermo keyword in a variable that requires pressure to be calculated, but your thermo output does not use it. Add it to your thermo output.
Thermo keyword in variable requires thermo to use/init temp You are using a thermo keyword in a variable that requires temperature to be calculated, but your thermo output does not use it. Add it to your thermo output.
Thermo style does not use press Cannot use thermo_modify to set this parameter since the thermo_style is not computing this quantity.
LAMMPS Documentation

Thermo style does not use temp Cannot use thermo_modify to set this parameter since the thermo_style is not computing this quantity.

Thermo_modify every variable returned a bad timestep The returned timestep is less than or equal to the current timestep.

Thermo_modify int format does not contain d character Self-explanatory.

Thermo_modify pressure ID does not compute pressure The specified compute ID does not compute pressure.

Thermo_modify temperature ID does not compute temperature The specified compute ID does not compute temperature.

Thermo_style command before simulation box is defined The thermo_style command cannot be used before a read_data, read_restart, or create_box command.

This variable thermo keyword cannot be used between runs Keywords that refer to time (such as cpu, elapsed) do not make sense in between runs.

Threshold for an atom property that is not allocated A dump threshold has been requested on a quantity that is not defined by the atom style used in this simulation.

Timestep must be >= 0 Specified timestep is invalid.

Too big a problem to use velocity create loop all The system size must fit in a 32-bit integer to use this option.

Too big a timestep for dump dcd The timestep must fit in a 32-bit integer to use this dump style.

Too big a timestep for dump xtc The timestep must fit in a 32-bit integer to use this dump style.

Too few bits for lookup table Table size specified via pair_modify command does not work with your machine’s floating point representation.

Too few lines in %s section of data file Self-explanatory.

Too few values in body lines in data file Self-explanatory.

Too few values in body section of molecule file Self-explanatory.

Too many -pk arguments in command line The string formed by concatenating the arguments is too long. Use a package command in the input script instead.

Too many MSM grid levels The max number of MSM grid levels is hardwired to 10.

Too many args in variable function More args are used than any variable function allows.

Too many atom pairs for pair bop The number of atomic pairs exceeds the expected number. Check your atomic structure to ensure that it is realistic.

Too many atom sorting bins This is likely due to an immense simulation box that has blown up to a large size.

Too many atom triplets for pair bop The number of three atom groups for angle determinations exceeds the expected number. Check your atomic structure to ensure that it is realistic.

Too many atoms for dump dcd The system size must fit in a 32-bit integer to use this dump style.

Too many atoms for dump xtc The system size must fit in a 32-bit integer to use this dump style.

Too many atoms to dump sort Cannot sort when running with more than 2^31 atoms.

Too many elements extracted from MEAM library Increase ‘maxelt’ in meam.h and recompile.

Too many exponent bits for lookup table Table size specified via pair_modify command does not work with your machine’s floating point representation.

Too many groups The maximum number of atom groups (including the “all” group) is given by MAX_GROUP in group.cpp and is 32.
Too many iterations You must use a number of iterations that fit in a 32-bit integer for minimization.

Too many lines in one body in data file - boost MAXBODY MAXBODY is a setting at the top of the src/read_data.cpp file. Set it larger and re-compile the code.

Too many local+ghost atoms for neighbor list The number of nlocal + nghost atoms on a processor is limited by the size of a 32-bit integer with 2 bits removed for masking 1-2, 1-3, 1-4 neighbors.

Too many mantissa bits for lookup table Table size specified via pair_modify command does not work with your machine’s floating point representation.

Too many masses for fix shake The fix shake command cannot list more masses than there are atom types.

Too many molecules for fix poems The limit is 2^31 = ~2 billion molecules.

Too many molecules for fix rigid The limit is 2^31 = ~2 billion molecules.

Too many neighbor bins This is likely due to an immense simulation box that has blown up to a large size.

Too many timesteps The cumulative timesteps must fit in a 64-bit integer.

Too many timesteps for NEB You must use a number of timesteps that fit in a 32-bit integer for NEB.

Too many total atoms See the setting for bigint in the src/lmptype.h file.

Too many total bits for bitmapped lookup table Table size specified via pair_modify command is too large. Note that a value of N generates a 2^N size table.

Too many values in body lines in data file Self-explanatory.

Too many values in body section of molecule file Self-explanatory.

Too much buffered per-proc info for dump The size of the buffered string must fit in a 32-bit integer for a dump.

Too much per-proc info for dump Number of local atoms times number of columns must fit in a 32-bit integer for dump.

Tree structure in joint connections Fix poems cannot (yet) work with coupled bodies whose joints connect the bodies in a tree structure.

Triclinic box skew is too large The displacement in a skewed direction must be less than half the box length in that dimension. E.g. the xy tilt must be between -half and +half of the x box length. This constraint can be relaxed by using the box tilt command.

Tried to convert a double to int, but input_double > INT_MAX Self-explanatory.

Trying to build an occasional neighbor list before initialization completed This is not allowed. Source code caller needs to be modified.

Two fix ave commands using same compute chunk/atom command in incompatible ways They are both attempting to “lock” the chunk/atom command so that the chunk assignments persist for some number of timesteps, but are doing it in different ways.

Two groups cannot be the same in fix spring couple Self-explanatory.

Unable to initialize accelerator for use There was a problem initializing an accelerator for the gpu package.

Unbalanced quotes in input line No matching end double quote was found following a leading double quote.

Unexpected end of -reorder file Self-explanatory.

Unexpected empty line in AngleCoeffs section Read a blank line where there should be coefficient data.

Unexpected empty line in BondCoeffs section Read a blank line where there should be coefficient data.

Unexpected empty line in DihedralCoeffs section Read a blank line where there should be coefficient data.

Unexpected empty line in ImproperCoeffs section Read a blank line where there should be coefficient data.
Unrecognized command: %s The command is not known to LAMMPS. Check the input script.

Unrecognized compute style The choice of compute style is unknown.

Unrecognized dihedral style The choice of dihedral style is unknown.

Unrecognized dump reader style The choice of dump reader style via the format keyword is unknown.

Unrecognized dump style The choice of dump style is unknown.

Unknown error in GPU library Self-explanatory.

Unrecognized fix style The choice of fix style is unknown.

Unknown identifier in data file: %s A section of the data file cannot be read by LAMMPS.

Unrecognized improper style The choice of improper style is unknown.

Unknown keyword in thermo_style custom command One or more specified keywords are not recognized.

Unrecognized kspace style The choice of kspace style is unknown.

Unknown name for info newton category Self-explanatory.

Unknown name for info package category Self-explanatory.

Unknown name for info pair category Self-explanatory.

Unrecognized pair style The choice of pair style is unknown.

Unknown pair_modify hybrid sub-style The choice of sub-style is unknown.

Unrecognized region style The choice of region style is unknown.
Unknown section in molecule file  Self-explanatory.

Unknown table style in angle style table  Self-explanatory.

Unknown table style in bond style table  Self-explanatory.

Unknown table style in pair_style command  Style of table is invalid for use with pair_style table command.

Unknown unit style  Self-explanatory. Check the input script or data file.

Unrecognized lattice type in MEAM library file  The lattice type in an entry of the MEAM library file is not valid.

Unrecognized lattice type in MEAM parameter file  The lattice type in an entry of the MEAM parameter file is not valid.

Unrecognized pair style in compute pair command  Self-explanatory.

Unsupported mixing rule in kspace_style ewald/disp  Only geometric mixing is supported.

Unsupported order in kspace_style ewald/disp  Only 1/r^6 dispersion or dipole terms are supported.

Unsupported order in kspace_style pppm/disp, pair_style %s  Only pair styles with 1/r and 1/r^6 dependence are currently supported.

Unsupported parameter in MEAM library file  Self-explanatory.

Use cutoff keyword to set cutoff in single mode  Mode is single so cutoff/multi keyword cannot be used.

Use cutoff/multi keyword to set cutoff in multi mode  Mode is multi so cutoff keyword cannot be used.

Using fix nvt/sllod with inconsistent fix deform remap option  Fix nvt/sllod requires that deforming atoms have a velocity profile provided by “remap v” as a fix deform option.

Using fix nvt/sllod with no fix deform defined  Self-explanatory.

Using fix srdf with inconsistent fix deform remap option  When shearing the box in an SRD simulation, the remap v option for fix deform needs to be used.

Using pair lubricate with inconsistent fix deform remap option  Must use remap v option with fix deform with this pair style.

Using pair lubricate/poly with inconsistent fix deform remap option  If fix deform is used, the remap v option is required.

Using suffix gpu without GPU package installed  Self-explanatory.

Using suffix intel without USER-INTEL package installed  Self-explanatory.

Using suffix kk without KOKKOS package enabled  Self-explanatory.

Using suffix omp without USER-OMP package installed  Self-explanatory.

Using update dipole flag requires atom attribute mu  Self-explanatory.

Using update dipole flag requires atom style sphere  Self-explanatory.

Variable ID in variable formula does not exist  Self-explanatory.

Variable atom ID is too large  Specified ID is larger than the maximum allowed atom ID.

Variable evaluation before simulation box is defined  Cannot evaluate a compute or fix or atom-based value in a variable before the simulation has been setup.

Variable evaluation in fix wall gave bad value  The returned value for epsilon or sigma < 0.0.

Variable evaluation in region gave bad value  Variable returned a radius < 0.0.

Variable for compute ti is invalid style  Self-explanatory.
Variable for create_atoms is invalid style The variables must be equal-style variables.
Variable for displace_atoms is invalid style It must be an equal-style or atom-style variable.
Variable for dump every is invalid style Only equal-style variables can be used.
Variable for dump image center is invalid style Must be an equal-style variable.
Variable for dump image persp is invalid style Must be an equal-style variable.
Variable for dump image phi is invalid style Must be an equal-style variable.
Variable for dump image theta is invalid style Must be an equal-style variable.
Variable for dump image zoom is invalid style Must be an equal-style variable.
Variable for fix adapt is invalid style Only equal-style variables can be used.
Variable for fix addforce is invalid style Self-explanatory.
Variable for fix aveforce is invalid style Only equal-style variables can be used.
Variable for fix deform is invalid style The variable must be an equal-style variable.
Variable for fix efield is invalid style The variable must be an equal- or atom-style variable.
Variable for fix gravity is invalid style Only equal-style variables can be used.
Variable for fix heat is invalid style Only equal-style or atom-style variables can be used.
Variable for fix indent is invalid style Only equal-style variables can be used.
Variable for fix indent is not equal style Only equal-style variables can be used.
Variable for fix langevin is invalid style It must be an equal-style variable.
Variable for fix move is invalid style Only equal-style variables can be used.
Variable for fix setforce is invalid style Only equal-style variables can be used.
Variable for fix temp/berendsen is invalid style Only equal-style variables can be used.
Variable for fix temp/csl is invalid style Only equal-style variables can be used.
Variable for fix temp/csvr is invalid style Only equal-style variables can be used.
Variable for fix temp/rescale is invalid style Only equal-style variables can be used.
Variable for fix wall is invalid style Only equal-style variables can be used.
Variable for fix wall/reflect is invalid style Only equal-style variables can be used.
Variable for fix wall/srd is invalid style Only equal-style variables can be used.
Variable for group dynamic is invalid style The variable must be an atom-style variable.
Variable for group is invalid style Only atom-style variables can be used.
Variable for region cylinder is invalid style Only equal-style variables are allowed.
Variable for region is invalid style Only equal-style variables can be used.
Variable for region is not equal style Self-explanatory.
Variable for region sphere is invalid style Only equal-style variables are allowed.
Variable for restart is invalid style Only equal-style variables can be used.
Variable for set command is invalid style Only atom-style variables can be used.
Variable for thermo every is invalid style Only equal-style variables can be used.
Variable for velocity set is invalid style Only atom-style variables can be used.

Variable for voronoi radius is not atom style Self-explanatory.

Variable formula compute array is accessed out-of-range Self-explanatory.

Variable formula compute vector is accessed out-of-range Self-explanatory.

Variable formula fix array is accessed out-of-range Self-explanatory.

Variable formula fix vector is accessed out-of-range Self-explanatory.

Variable has circular dependency A circular dependency is when variable “a” in used by variable “b” and variable “b” is also used by variable “a”. Circular dependencies with longer chains of dependence are also not allowed.

Variable name between brackets must be alphanumeric or underscore characters Self-explanatory.

Variable name for compute chunk/atom does not exist Self-explanatory.

Variable name for compute reduce does not exist Self-explanatory.

Variable name for compute ti does not exist Self-explanatory.

Variable name for create_atoms does not exist Self-explanatory.

Variable name for displace_atoms does not exist Self-explanatory.

Variable name for dump every does not exist Self-explanatory.

Variable name for dump image center does not exist Self-explanatory.

Variable name for dump image persp does not exist Self-explanatory.

Variable name for dump image phi does not exist Self-explanatory.

Variable name for dump image theta does not exist Self-explanatory.

Variable name for dump image zoom does not exist Self-explanatory.

Variable name for fix adapt does not exist Self-explanatory.

Variable name for fix addforce does not exist Self-explanatory.

Variable name for fix ave/atom does not exist Self-explanatory.

Variable name for fix ave/chunk does not exist Self-explanatory.

Variable name for fix ave/correlate does not exist Self-explanatory.

Variable name for fix ave/histo does not exist Self-explanatory.

Variable name for fix ave/spatial does not exist Self-explanatory.

Variable name for fix ave/time does not exist Self-explanatory.

Variable name for fix aveforce does not exist Self-explanatory.

Variable name for fix deform does not exist Self-explanatory.

Variable name for fix efield does not exist Self-explanatory.

Variable name for fix gravity does not exist Self-explanatory.

Variable name for fix heat does not exist Self-explanatory.

Variable name for fix indent does not exist Self-explanatory.

Variable name for fix langevin does not exist Self-explanatory.

Variable name for fix move does not exist Self-explanatory.
Variable name for fix setforce does not exist  Self-explanatory.
Variable name for fix store/state does not exist  Self-explanatory.
Variable name for fix temp/berendsen does not exist  Self-explanatory.
Variable name for fix temp/csl does not exist  Self-explanatory.
Variable name for fix temp/csv does not exist  Self-explanatory.
Variable name for fix temp/rescale does not exist  Self-explanatory.
Variable name for fix vector does not exist  Self-explanatory.
Variable name for fix wall does not exist  Self-explanatory.
Variable name for fix wall/reflect does not exist  Self-explanatory.
Variable name for fix wall/srd does not exist  Self-explanatory.
Variable name for group does not exist  Self-explanatory.
Variable name for group dynamic does not exist  Self-explanatory.
Variable name for region cylinder does not exist  Self-explanatory.
Variable name for region does not exist  Self-explanatory.
Variable name for region sphere does not exist  Self-explanatory.
Variable name for restart does not exist  Self-explanatory.
Variable name for set command does not exist  Self-explanatory.
Variable name for thermo every does not exist  Self-explanatory.
Variable name for velocity set does not exist  Self-explanatory.
Variable name for voronoi radius does not exist  Self-explanatory.
Variable name must be alphanumeric or underscore characters  Self-explanatory.
Variable uses atom property that is not allocated  Self-explanatory.
Velocity command before simulation box is defined  The velocity command cannot be used before a read_data, read_restart, or create_box command.
Velocity command with no atoms existing  A velocity command has been used, but no atoms yet exist.
Velocity ramp in z for a 2d problem  Self-explanatory.
Velocity rigid used with non-rigid fix-ID  Self-explanatory.
Velocity temperature ID does calculate a velocity bias  The specified compute must compute a bias for temperature.
Velocity temperature ID does not compute temperature  The compute ID given to the velocity command must compute temperature.
Verlet/split can only currently be used with comm_style brick  This is a current restriction in LAMMPS.
Verlet/split does not yet support TIP4P  This is a current limitation.
Verlet/split requires 2 partitions  See the -partition command-line switch.
Verlet/split requires Rspace partition layout be multiple of Kspace partition layout in each dim  This is controlled by the processors command.
Verlet/split requires Rspace partition size be multiple of Kspace partition size  This is so there is an equal number of Rspace processors for every Kspace processor.
Virial was not tallied on needed timestep You are using a thermo keyword that requires potentials to have tallied the virial, but they did not on this timestep. See the variable doc page for ideas on how to make this work.

Voro++ error: narea and neigh have a different size This error is returned by the Voro++ library.

Wall defined twice in fix wall command Self-explanatory.

Wall defined twice in fix wall/reflect command Self-explanatory.

Wall defined twice in fix wall/srd command Self-explanatory.

Water H epsilon must be 0.0 for pair style lj/cut/tip4p/cut This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

Water H epsilon must be 0.0 for pair style lj/cut/tip4p/long This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

Water H epsilon must be 0.0 for pair style lj/long/tip4p/long This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

World variable count does not match # of partitions A world-style variable must specify a number of values equal to the number of processor partitions.

Write_data command before simulation box is defined Self-explanatory.

Write_restart command before simulation box is defined The write_restart command cannot be used before a read_data, read_restart, or create_box command.

Writing to MPI-IO filename when MPIIO package is not installed Self-explanatory.

Zero length rotation vector with displace_atoms Self-explanatory.

Zero length rotation vector with fix move Self-explanatory.

Zero-length lattice orient vector Self-explanatory.

12.5 Warning messages

This is an alphabetic list of the WARNING messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. Warning messages also list the source file and line number where the warning was generated. For example, a message like this:

WARNING: Bond atom missing in box size check (domain.cpp:187)

means that line #187 in the file src/domain.cpp generated the error. Looking in the source code may help you figure out what went wrong.

Note that warning messages from user-contributed packages are not listed here. If such a warning occurs and is not self-explanatory, you will need to look in the source code or contact the author of the package.

Doc page with ERROR messages

Adjusting Coulombic cutoff for MSM, new cutoff = %g The adjust/cutoff command is turned on and the Coulombic cutoff has been adjusted to match the user-specified accuracy.

Angle atoms missing at step %ld One or more of 3 atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

Angle style in data file differs from currently defined angle style Self-explanatory.
**Angles are defined but no angle style is set**  The topology contains angles, but there are no angle forces computed since there was no angle_style command.

**Atom style in data file differs from currently defined atom style**  Self-explanatory.

**Bond atom missing in box size check**  The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

**Bond atom missing in image check**  The second atom in a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

**Bond atoms missing at step %ld**  The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

**Bond style in data file differs from currently defined bond style**  Self-explanatory.

**Bonds are defined but no bond style is set**  The topology contains bonds, but there are no bond forces computed since there was no bond_style command.

**Bond/angle/dihedral extent > half of periodic box length**  This is a restriction because LAMMPS can be confused about which image of an atom in the bonded interaction is the correct one to use. “Extent” in this context means the maximum end-to-end length of the bond/angle/dihedral. LAMMPS computes this by taking the maximum bond length, multiplying by the number of bonds in the interaction (e.g. 3 for a dihedral) and adding a small amount of stretch.

**Bond/react: Atom affected by reaction too close to template edge**  This means an atom which changes type or connectivity during the reaction is too close to an ‘edge’ atom defined in the superimpose file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.

**Both groups in compute group/group have a net charge; the Kspace boundary correction to energy will be non-zero**  Self-explanatory.

**Calling write_dump before a full system init.**  The write_dump command is used before the system has been fully initialized as part of a ‘run’ or ‘minimize’ command. Not all dump styles and features are fully supported at this point and thus the command may fail or produce incomplete or incorrect output. Insert a “run 0” command, if a full system init is required.

**Cannot count rigid body degrees-of-freedom before bodies are fully initialized**  This means the temperature associated with the rigid bodies may be incorrect on this timestep.

**Cannot count rigid body degrees-of-freedom before bodies are initialized**  This means the temperature associated with the rigid bodies may be incorrect on this timestep.

**Cannot include log terms without 1/r terms; setting flagHI to 1**  Self-explanatory.

**Cannot include log terms without 1/r terms; setting flagHI to 1.**  Self-explanatory.

**Charges are set, but coulombic solver is not used**  Self-explanatory.

**Charges did not converge at step %ld: %lg**  Self-explanatory.

**Communication cutoff is 0.0. No ghost atoms will be generated. Atoms may get lost**  The communication cutoff defaults to the maximum of what is inferred from pair and bond styles (will be zero, if none are defined) and what is specified via `comm_modify cutoff` (defaults to 0.0). If this results to 0.0, no ghost atoms will be generated and LAMMPS may lose atoms or use incorrect periodic images of atoms in interaction lists. To avoid, either use `pair style zero` with a suitable cutoff or use `comm_modify cutoff`.

**Communication cutoff is shorter than a bond length based estimate. This may lead to errors.**
Since LAMMPS stores topology data with individual atoms, all atoms comprising a bond, angle, dihedral or improper must be present on any sub-domain that “owns” the atom with the information, either as a local or a ghost atom. The communication cutoff is what determines up to what distance from a sub-domain boundary ghost atoms are created. The communication cutoff is by default the largest non-bonded cutoff plus the neighbor skin distance, but for short or non-bonded cutoffs and/or long bonds, this may not be sufficient. This warning indicates that there is an increased risk of a simulation stopping unexpectedly because of Bond/Angle/Dihedral/Improper atoms missing. It can be silenced by manually setting the communication cutoff via `comm_modify cutoff`. However, since the heuristic used to determine the estimate is not always accurate, it is not changed automatically and the warning may be ignored depending on the specific system being simulated.

**Communication cutoff is too small for SNAP micro load balancing, increased to %lf** Self-explanatory.

**Compute cnat/atom cutoff may be too large to find ghost atom neighbors** The neighbor cutoff used may not encompass enough ghost atoms to perform this operation correctly.

**Computing temperature of portions of rigid bodies** The group defined by the temperature compute does not encompass all the atoms in one or more rigid bodies, so the change in degrees-of-freedom for the atoms in those partial rigid bodies will not be accounted for.

**Create_bonds max distance > minimum neighbor cutoff** This means atom pairs for some atom types may not be in the neighbor list and thus no bond can be created between them.

**Delete_atoms cutoff > minimum neighbor cutoff** This means atom pairs for some atom types may not be in the neighbor list and thus an atom in that pair cannot be deleted.

**Dihedral atoms missing at step %ld** One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

**Dihedral problem** Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

**Dihedral problem: %d %ld %d %d %d %d** Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

**Dihedral style in data file differs from currently defined dihedral style** Self-explanatory.

**Dihedrals are defined but no dihedral style is set** The topology contains dihedrals, but there are no dihedral forces computed since there was no `dihedral_style` command.

**Dump dcd/xtc timestamp may be wrong with fix dt/reset** If the fix changes the timestep, the dump dcd file will not reflect the change.

**Energy due to X extra global DOFs will be included in minimizer energies** When using fixes like box/relax, the potential energy used by the minimizer is augmented by an additional energy provided by the fix. Thus the printed converged energy may be different from the total potential energy.

**Estimated error in splitting of dispersion coeffs is %g** Error is greater than 0.0001 percent.

**Ewald/disp Newton solver failed, using old method to estimate g_ewald** Self-explanatory. Choosing a different cutoff value may help.

**FENE bond too long** A FENE bond has stretched dangerously far. It’s interaction strength will be truncated to attempt to prevent the bond from blowing up.

**FENE bond too long: %ld %d %d %g** A FENE bond has stretched dangerously far. It’s interaction strength will be truncated to attempt to prevent the bond from blowing up.

**FENE bond too long: %ld %g** A FENE bond has stretched dangerously far. It’s interaction strength will be truncated to attempt to prevent the bond from blowing up.

**Fix halt condition for fix-id %s met on step %ld with value %g** Self explanatory.
Fix SRD walls overlap but fix srd overlap not set You likely want to set this in your input script.

- Fix bond/create is used multiple times or with fix bond/break - may not work as expected When using fix bond/create multiple times or in combination with fix bond/break, the individual fix instances do not share information about changes they made at the same time step and thus it may result in unexpected behavior.

Fix bond/swap will ignore defined angles See the doc page for fix bond/swap for more info on this restriction.

Fix deposit near setting < possible overlap separation %g This test is performed for finite size particles with a diameter, not for point particles. The near setting is smaller than the particle diameter which can lead to overlaps.

Fix evaporate may delete atom with non-zero molecule ID This is probably an error, since you should not delete only one atom of a molecule.

Fix gcmc using full_energy option Fix gcmc has automatically turned on the full_energy option since it is required for systems like the one specified by the user. User input included one or more of the following: kspace, triclinic, a hybrid pair style, an eam pair style, or no “single” function for the pair style.

Fix langevin gif using random gaussians is not implemented with kokkos This will most likely cause errors in kinetic fluctuations.

Fix property/atom mol or charge w/out ghost communication A model typically needs these properties defined for ghost atoms.

Fix qeq CG convergence failed (%g) after %d iterations at %ld step Self-explanatory.

Fix qeq has non-zero lower Taper radius cutoff Absolute value must be <= 0.01.

Fix qeq has very low Taper radius cutoff Value should typically be >= 5.0.

Fix qeq/dynamic tolerance may be too small for damped dynamics Self-explanatory.

Fix qeq/fire tolerance may be too small for damped fires Self-explanatory.

Fix rattle should come after all other integration fixes This fix is designed to work after all other integration fixes change atom positions. Thus it should be the last integration fix specified. If not, it will not satisfy the desired constraints as well as it otherwise would.

Fix recenter should come after all other integration fixes Other fixes may change the position of the center-of-mass, so fix recenter should come last.

Fix srd SRD moves may trigger frequent reneighboring This is because the SRD particles may move long distances.

Fix srd grid size > 1/4 of big particle diameter This may cause accuracy problems.

Fix srd particle moved outside valid domain This may indicate a problem with your simulation parameters.

Fix srd particles may move > big particle diameter This may cause accuracy problems.

Fix srd viscosity < 0.0 due to low SRD density This may cause accuracy problems.

Fixes cannot send data in Kokkos communication, switching to classic communication This is current restriction with Kokkos.

For better accuracy use ‘pair_modify table 0’ The user-specified force accuracy cannot be achieved unless the table feature is disabled by using ‘pair_modify table 0’.

Geometric mixing assumed for 1/r^6 coefficients Self-explanatory.

Group for fix_modify temp != fix group The fix_modify command is specifying a temperature computation that computes a temperature on a different group of atoms than the fix itself operates on. This is probably not what you want to do.

H matrix size has been exceeded: m_fill=%d H.m=%dn This is the size of the matrix.
Ignoring unknown or incorrect info command flag  Self-explanatory. An unknown argument was given to the info command. Compare your input with the documentation.

Improper atoms missing at step %ld  One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

Improper problem: %ld %ld %ld %ld %ld Conformation of the 4 listed improper atoms is extreme; you may want to check your simulation geometry.

Improper style in data file differs from currently defined improper style  Self-explanatory.

Impropers are defined but no improper style is set  The topology contains impropers, but there are no improper forces computed since there was no improper_style command.

Inconsistent image flags  The image flags for a pair on bonded atoms appear to be inconsistent. Inconsistent means that when the coordinates of the two atoms are unwrapped using the image flags, the two atoms are far apart. Specifically they are further apart than half a periodic box length. Or they are more than a box length apart in a non-periodic dimension. This is usually due to the initial data file not having correct image flags for the 2 atoms in a bond that straddles a periodic boundary. They should be different by 1 in that case. This is a warning because inconsistent image flags will not cause problems for dynamics or most LAMMPS simulations. However they can cause problems when such atoms are used with the fix rigid or replicate commands. Note that if you have an infinite periodic crystal with bonds then it is impossible to have fully consistent image flags, since some bonds will cross periodic boundaries and connect two atoms with the same image flag.

Increasing communication cutoff for GPU style  The pair style has increased the communication cutoff to be consistent with the communication cutoff requirements for this pair style when run on the GPU.

KIM Model does not provide ‘energy’; Potential energy will be zero  Self-explanatory.

KIM Model does not provide ‘forces’; Forces will be zero  Self-explanatory.

KIM Model does not provide ‘particleEnergy’; energy per atom will be zero  Self-explanatory.

KIM Model does not provide ‘particleVirial’; virial per atom will be zero  Self-explanatory.

Kspace_modify slab param < 2.0 may cause unphysical behavior  The kspace_modify slab parameter should be larger to insure periodic grids padded with empty space do not overlap.

Less insertions than requested  The fix pour command was unsuccessful at finding open space for as many particles as it tried to insert.

Library error in lammps_gather_atoms  This library function cannot be used if atom IDs are not defined or are not consecutively numbered.

Library error in lammps_scatter_atoms  This library function cannot be used if atom IDs are not defined or are not consecutively numbered, or if no atom map is defined. See the atom_modify command for details about atom maps.

Likewise 1-2 special neighbor interactions != 1.0  The topology contains bonds, but there is no bond style defined and a 1-2 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the bond style.

Likewise 1-3 special neighbor interactions != 1.0  The topology contains angles, but there is no angle style defined and a 1-3 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the angle style.

Likewise 1-4 special neighbor interactions != 1.0  The topology contains dihedrals, but there is no dihedral style defined and a 1-4 special neighbor scaling factor was not 1.0. This means that pair style interactions may have
scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the dihedral style.

**Lost atoms via change_box:** original %ld current %ld  The command options you have used caused atoms to be lost.

**Lost atoms via displace_atoms:** original %ld current %ld  The command options you have used caused atoms to be lost.

**Lost atoms:** original %ld current %ld  Lost atoms are checked for each time thermo output is done. See the thermo_modify lost command for options. Lost atoms usually indicate bad dynamics, e.g. atoms have been blown far out of the simulation box, or moved further than one processor’s sub-domain away before reneighboring.

**MSM mesh too small, increasing to 2 points in each direction**  Self-explanatory.

**Mismatch between velocity and compute groups**  The temperature computation used by the velocity command will not be on the same group of atoms that velocities are being set for.

**Mixing forced for lj coefficients**  Self-explanatory.

**Molecule attributes do not match system attributes**  An attribute is specified (e.g. diameter, charge) that is not defined for the specified atom style.

**Molecule has bond topology but no special bond settings**  This means the bonded atoms will not be excluded in pairwise interactions.

**Molecule template for create_atoms has multiple molecules**  The create_atoms command will only create molecules of a single type, i.e. the first molecule in the template.

**Molecule template for fix gcme has multiple molecules**  The fix gcme command will only create molecules of a single type, i.e. the first molecule in the template.

**Molecule template for fix shake has multiple molecules**  The fix shake command will only recognize molecules of a single type, i.e. the first molecule in the template.

**More than one compute centro/atom**  It is not efficient to use compute centro/atom more than once.

**More than one compute cluster/atom**  It is not efficient to use compute cluster/atom more than once.

**More than one compute cna/atom defined**  It is not efficient to use compute cna/atom more than once.

**More than one compute contact/atom**  It is not efficient to use compute contact/atom more than once.

**More than one compute coord/atom**  It is not efficient to use compute coord/atom more than once.

**More than one compute damage/atom**  It is not efficient to use compute ke/atom more than once.

**More than one compute dilatation/atom**  Self-explanatory.

**More than one compute erorate/sphere/atom**  It is not efficient to use compute erorate/sphere/atom more than once.

**More than one compute hexorder/atom**  It is not efficient to use compute hexorder/atom more than once.

**More than one compute ke/atom**  It is not efficient to use compute ke/atom more than once.

**More than one compute orientorder/atom**  It is not efficient to use compute orientorder/atom more than once.

**More than one compute plasticity/atom**  Self-explanatory.

**More than one compute sna/atom**  Self-explanatory.

**More than one compute snad/atom**  Self-explanatory.

**More than one compute snav/atom**  Self-explanatory.

**More than one fix poems**  It is not efficient to use fix poems more than once.

**More than one fix rigid**  It is not efficient to use fix rigid more than once.
**Neighbor exclusions used with KSpace solver may give inconsistent Coulombic energies**  This is because excluding specific pair interactions also excludes them from long-range interactions which may not be the desired effect. The special_bonds command handles this consistently by insuring excluded (or weighted) 1-2, 1-3, 1-4 interactions are treated consistently by both the short-range pair style and the long-range solver. This is not done for exclusions of charged atom pairs via the neigh_modify exclude command.

**New thermo_style command, previous thermo_modify settings will be lost**  If a thermo_style command is used after a thermo_modify command, the settings changed by the thermo_modify command will be reset to their default values. This is because the thermo_modify command acts on the currently defined thermo style, and a thermo_style command creates a new style.

**No Kspace calculation with verlet/split**  The second partition performs a kspace calculation so the kspace_style command must be used.

**No automatic unit conversion to XTC file format conventions possible for units lj**  This means no scaling will be performed.

**No fixes defined, atoms won’t move**  If you are not using a fix like nve, nvt, npt then atom velocities and coordinates will not be updated during time stepping.

**No joints between rigid bodies, use fix rigid instead**  The bodies defined by fix poems are not connected by joints. POEMS will integrate the body motion, but it would be more efficient to use fix rigid.

**Not using real units with pair reax**  This is most likely an error, unless you have created your own ReaxFF parameter file in a different set of units.

**Number of MSM mesh points changed to be a multiple of 2**  MSM requires that the number of grid points in each direction be a multiple of two and the number of grid points in one or more directions have been adjusted to meet this requirement.

**OMP_NUM_THREADS environment is not set.**  This environment variable must be set appropriately to use the USER-OMP package.

**One or more atoms are time integrated more than once**  This is probably an error since you typically do not want to advance the positions or velocities of an atom more than once per timestep.

**One or more chunks do not contain all atoms in molecule**  This may not be what you intended.

**One or more dynamic groups may not be updated at correct point in timestep**  If there are other fixes that act immediately after the initial stage of time integration within a timestep (i.e. after atoms move), then the command that sets up the dynamic group should appear after those fixes. This will insure that dynamic group assignments are made after all atoms have moved.

**One or more respa levels compute no forces**  This is computationally inefficient.

**Pair COMB charge %10f with force %10f hit max barrier**  Something is possibly wrong with your model.

**Pair COMB charge %10f with force %10f hit min barrier**  Something is possibly wrong with your model.

**Pair brownian needs newton pair on for momentum conservation**  Self-explanatory.

**Pair dpd needs newton pair on for momentum conservation**  Self-explanatory.

**Pair dsmc: num_of_collisions > number_of_A**  Collision model in DSMC is breaking down.

**Pair dsmc: num_of_collisions > number_of_B**  Collision model in DSMC is breaking down.

**Pair style in data file differs from currently defined pair style**  Self-explanatory.

**Pair style restartinfo set but has no restart support**  This pair style has a bug, where it does not support reading and writing information to a restart file, but does not set the member variable “restartinfo” to 0 as required in that case.
**Particle deposition was unsuccessful**  The fix deposit command was not able to insert as many atoms as needed. The requested volume fraction may be too high, or other atoms may be in the insertion region.

**Proc sub-domain size < neighbor skin, could lead to lost atoms**  The decomposition of the physical domain (likely due to load balancing) has led to a processor’s sub-domain being smaller than the neighbor skin in one or more dimensions. Since reneighboring is triggered by atoms moving the skin distance, this may lead to lost atoms, if an atom moves all the way across a neighboring processor’s sub-domain before reneighboring is triggered.

**Reducing PPPM order b/c stencil extends beyond nearest neighbor processor**  This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

**Reducing PPPMDisp Coulomb order b/c stencil extends beyond neighbor processor**  This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

**Reducing PPPMDisp dispersion order b/c stencil extends beyond neighbor processor**  This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

**Replacing a fix, but new group != old group**  The ID and style of a fix match for a fix you are changing with a fix command, but the new group you are specifying does not match the old group.

**Replicating in a non-periodic dimension**  The parameters for a replicate command will cause a non-periodic dimension to be replicated; this may cause unwanted behavior.

**Resetting reneighboring criteria during PRD**  A PRD simulation requires that neigh_modify settings be delay = 0, every = 1, check = yes. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the PRD simulation.

**Resetting reneighboring criteria during TAD**  A TAD simulation requires that neigh_modify settings be delay = 0, every = 1, check = yes. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the TAD simulation.

**Resetting reneighboring criteria during minimization**  Minimization requires that neigh_modify settings be delay = 0, every = 1, check = yes. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the minimization.

**Restart file used different # of processors**  The restart file was written out by a LAMMPS simulation running on a different number of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

**Restart file used different 3d processor grid**  The restart file was written out by a LAMMPS simulation running on a different 3d grid of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

**Restart file used different boundary settings, using restart file values**  Your input script cannot change these restart file settings.

**Restart file used different newton bond setting, using restart file value**  The restart file value will override the setting in the input script.

**Restart file used different newton pair setting, using input script value**  The input script value will override the setting in the restart file.

**Restrain problem: %d %ld %d %d %d %d**  Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

**Running PRD with only one replica**  This is allowed, but you will get no parallel speed-up.

**SRD bin shifting turned on due to small lamda**  This is done to try to preserve accuracy.

**SRD bin size for fix srd differs from user request**  Fix SRD had to adjust the bin size to fit the simulation box. See the cubic keyword if you want this message to be an error vs warning.
**SRD bins for fix srd are not cubic enough**  The bin shape is not within tolerance of cubic. See the cubic keyword if you want this message to be an error vs warning.

**SRD particle %d started inside big particle %d on step %ld bounce %d**  See the inside keyword if you want this message to be an error vs warning.

**SRD particle %d started inside wall %d on step %ld bounce %d**  See the inside keyword if you want this message to be an error vs warning.

**Shake determinant < 0.0**  The determinant of the quadratic equation being solved for a single cluster specified by the fix shake command is numerically suspect. LAMMPS will set it to 0.0 and continue.

**Shell command ‘%s’ failed with error ‘%s’**  Self-explanatory.

**Shell command returned with non-zero status**  This may indicate the shell command did not operate as expected.

**Should not allow rigid bodies to bounce off reflecting walls**  LAMMPS allows this, but their dynamics are not computed correctly.

**Should not use fix nve/limit with fix shake or fix rattle**  This will lead to invalid constraint forces in the SHAKE/RATTLE computation.

**Simulations might be very slow because of large number of structure factors**  Self-explanatory.

**Slab correction not needed for MSM**  Slab correction is intended to be used with Ewald or PPPM and is not needed by MSM.

**Specifying an ‘subset’ value of ‘0’ is equivalent to no ‘subset’ keyword**  Self-explanatory.

**System is not charge neutral, net charge = %g**  The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is only a warning.

**Table inner cutoff >= outer cutoff**  You specified an inner cutoff for a Coulombic table that is longer than the global cutoff. Probably not what you wanted.

**Temperature for MSST is not for group all**  User-assigned temperature to MSST fix does not compute temperature for all atoms. Since MSST computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by MSST could be inaccurate.

**Temperature for NPT is not for group all**  User-assigned temperature to NPT fix does not compute temperature for all atoms. Since NPT computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by NPT could be inaccurate.

**Temperature for fix modify is not for group all**  The temperature compute is being used with a pressure calculation which does operate on group all, so this may be inconsistent.

**Temperature for thermo pressure is not for group all**  User-assigned temperature to thermo via the thermo_modify command does not compute temperature for all atoms. Since thermo computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure printed by thermo could be inaccurate.

**The fix ave/spatial command has been replaced by the more flexible fix ave/chunk and compute chunk/atom commands – fix ave/spatial will be removed in the summer of 2015**  Self-explanatory.

**The minimizer does not re-orient dipoles when using fix efield**  This means that only the atom coordinates will be minimized, not the orientation of the dipoles.

**Too many common neighbors in CNA %d times**  More than the maximum # of neighbors was found multiple times. This was unexpected.

**Too many inner timesteps in fix ttm**  Self-explanatory.

**Too many neighbors in CNA for %d atoms**  More than the maximum # of neighbors was found multiple times. This was unexpected.
**Triclinic box skew is large**  The displacement in a skewed direction is normally required to be less than half the box length in that dimension. E.g. the xy tilt must be between -half and +half of the x box length. You have relaxed the constraint using the box tilt command, but the warning means that a LAMMPS simulation may be inefficient as a result.

**Use special bonds = 0,1,1 with bond style fene**  Most FENE models need this setting for the special_bonds command.

**Use special bonds = 0,1,1 with bond style fene/expand**  Most FENE models need this setting for the special_bonds command.

**Using a many-body potential with bonds/angles/dihedrals and special_bond exclusions**  This is likely not what you want to do. The exclusion settings will eliminate neighbors in the neighbor list, which the many-body potential needs to calculated its terms correctly.

**Using compute temp/deform with inconsistent fix deform remap option**  Fix nvt/sllod assumes deforming atoms have a velocity profile provided by “remap v” or “remap none” as a fix deform option.

**Using compute temp/deform with no fix deform defined**  This is probably an error, since it makes little sense to use compute temp/deform in this case.

**Using fix srd with box deformation but no SRD thermostat**  The deformation will heat the SRD particles so this can be dangerous.

**Using kspace solver on system with no charge**  Self-explanatory.

**Using largest cut-off for lj/long/dipole/long long long**  Self-explanatory.

**Using largest cutoff for buck/long/coul/long**  Self-explanatory.

**Using largest cutoff for lj/long/coul/long**  Self-explanatory.

**Using largest cutoff for pair_style lj/long/tip4p/long**  Self-explanatory.

**Using package gpu without any pair style defined**  Self-explanatory.

**Using pair potential shift with pair_modify compute no**  The shift effects will thus not be computed.

**Using pair tail corrections with nonperiodic system**  This is probably a bogus thing to do, since tail corrections are computed by integrating the density of a periodic system out to infinity.

**Using pair tail corrections with pair_modify compute no**  The tail corrections will thus not be computed.

pair style reax is now deprecated and will soon be retired. Users should switch to pair_style reax/e  Self-explanatory.
Depending on how you obtained LAMMPS and whether you have built the manual yourself, this directory has a number of sub-directories and files. Here is a list with descriptions:

- **README**: # brief info about the documentation
- **src**: # content files for LAMMPS documentation
- **html**: # HTML version of the LAMMPS manual (see html/Manual.html)
- **utils**: # tools and settings for building the documentation
- **lammps.1**: # man page for the lammps command
- **msi2lmp.1**: # man page for the msi2lmp command
- **Manual.pdf**: # large PDF version of entire manual
- **LAMMPS.epub**: # Manual in ePUB e-book format
- **LAMMPS.mobi**: # Manual in MOBI e-book format
- **docenv**: # virtualenv folder for processing the manual sources
- **doctrees**: # temporary data from processing the manual
- **mathjax**: # code and fonts for rendering math in html
- **doxygen**: # doxygen configuration and output
- **.gitignore**: # list of files and folders to be ignored by git

If you downloaded LAMMPS as a tarball from the LAMMPS website, the html folder and the PDF files should be included.

If you downloaded LAMMPS from the public git repository, then the HTML and PDF files are not included. Instead you need to create them, in one of two ways:

a. You can “fetch” the current HTML and PDF files from the LAMMPS web site. Just type `make fetch`. This should download a html_www directory and a Manual_www.pdf file. Note that if new LAMMPS features have been added more recently than the date of your LAMMPS version, the fetched documentation will include those changes (but your source code will not, unless you update your local repository).

b. You can build the HTML or PDF files yourself, by typing `make html` or `make pdf`. This requires various tools and files. Some of them have to be installed (more on that below). For the rest the build process will attempt to download and install them into a python virtual environment and local folders. This download is required only once, unless you type `make clean-all`. After that, viewing and processing of the documentation can be done without internet access.

A current version of the manual (latest patch release, aka unstable branch) is is available online at: https://lammps.sandia.gov/doc/Manual.html A version of the manual corresponding to the ongoing development (aka master branch) is available online at: https://docs.lammps.org/

The generation of all documentation is managed by the Makefile in the doc directory. The following documentation related make commands are available:
13.1 Installing prerequisites for HTML build

To run the HTML documentation build toolchain, python 3, git, doxygen, and virtualenv have to be installed locally. Here are instructions for common setups:

13.1.1 Ubuntu

```bash
sudo apt-get install python-virtualenv git doxygen
```

13.1.2 Fedora (up to version 21) and Red Hat Enterprise Linux or CentOS (up to version 7.x)

```bash
sudo yum install python3-virtualenv git doxygen
```

13.1.3 Fedora (since version 22)

```bash
sudo dnf install python3-virtualenv git doxygen
```

13.1.4 MacOS X

Python 3

Download the latest Python 3 MacOS X package from https://www.python.org and install it. This will install both Python 3 and pip3.
virtualenv

Once Python 3 is installed, open a Terminal and type

```
pip3 install virtualenv
```

This will install virtualenv from the Python Package Index.

13.2 Installing prerequisites for PDF build

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with support for PDFLaTeX and a selection of LaTeX styles/packages are required. To run the PDFLaTeX translation the tools `latexmk` and `xindy` need to be installed as well.

13.3 Installing prerequisites for e-book reader builds

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with a few add-on LaTeX packages as well as the `dvipng` tool are required to convert embedded math expressions transparently into embedded images.

For converting the generated ePUB file to a MOBI format file (for e-book readers, like Kindle, that cannot read ePUB), you also need to have the `ebook-convert` tool from the “calibre” software installed. http://calibre-ebook.com/

Typing `make mobi` will first create the ePUB file and then convert it. On the Kindle readers in particular, you also have support for PDF files, so you could download and view the PDF version as an alternative.

13.4 Instructions for Developers

When adding new styles or options to the LAMMPS code, corresponding documentation is required and either existing files in the `src` folder need to be updated or new files added. These files are written in reStructuredText markup for translation with the Sphinx tool.

Before contributing any documentation, please check that both the HTML and the PDF format documentation can translate without errors. Please also check the output to the console for any warnings or problems. There will be multiple tests run automatically:

- A test for correctness of all anchor labels and their references
- A test that all LAMMPS packages (= folders with sources in `lammps/src`) are documented and listed. A typical warning shows the name of the folder with the suspected new package code and the documentation files where they need to be listed:

```
Found 33 standard and 41 user packages
Standard package NEWPACKAGE missing in Packages_standard.rst
Standard package NEWPACKAGE missing in Packages_details.rst
```

- A test that only standard, printable ASCII text characters are used. This runs the command `env LC_ALL=C grep -n '^[^-~]' src/*.rst` and thus prints all offending lines with filename and line number prepended to the screen. Special characters like the Angstrom Å should be typeset with embedded math (like this: `\mathrm{\mathring{A}}`).

- A test whether all styles are documented and listed in their respective overview pages. A typical output with warnings looks like this:
Parsed style names w/o suffixes from C++ tree in ../src:

<table>
<thead>
<tr>
<th>Style Type</th>

Fix style entry newfix is missing or incomplete in fix.rst
Pair style entry new is missing or incomplete in Commands_pair.rst
Pair style entry new is missing or incomplete in pair_style.rst
Pair style entry new is missing or incomplete in pair_style.rst

In addition, there is the option to run a spellcheck on the entire manual with make spelling. This requires a library called enchant. To avoid printing out false positives (e.g. keywords, names, abbreviations) those can be added to the file lammps/doc/utils/sphinx-config/false_positives.txt.
Part II

Programmer Documentation
CHAPTER
FOURTEEN

LAMMPS LIBRARY INTERFACES

As described on the library interface to LAMMPS doc page, LAMMPS can be built as a library (static or shared), so that it can be called by another code, used in a coupled manner with other codes, or driven through a Python script. Even the LAMMPS standalone executable is essentially a thin wrapper on top of the LAMMPS library, creating a LAMMPS instance, processing input and then exiting.

Several of these approaches are based on C language wrapper functions in the files src/library.h and src/library.cpp, but it is also possible to use C++ directly. The basic procedure is always the same: you create one or more instances of the LAMMPS and then pass commands as strings or from files to that LAMMPS instance to execute calculations, or read, manipulate, and update data from the active class instances inside the LAMMPS to do analysis or perform operations that are not possible with existing commands.

Thread-safety

LAMMPS was initially not conceived as a thread-safe program, but over the years changes have been applied to replace operations that collide with creating multiple LAMMPS instances from multiple-threads of the same process with thread-safe alternatives. This primarily applies to the core LAMMPS code and less so on add-on packages, especially when those packages require additional code in the lib folder, interface LAMMPS to Fortran libraries, or the code uses static variables (like the USER-COLVARS package).

Another major issue to deal with is to correctly handle MPI. Creating a LAMMPS instance requires passing an MPI communicator, or it assumes the MPI_COMM_WORLD communicator, which spans all MPI processor ranks. When creating multiple LAMMPS object instances from different threads, this communicator has to be different for each thread or else collisions can happen. or it has to be guaranteed, that only one thread at a time is active. MPI communicators, however, are not a problem, if LAMMPS is compiled with the MPI STUBS library, which implies that there is no MPI communication and only 1 MPI rank.

14.1 LAMMPS C Library API

The C library interface is most commonly used path to manage LAMMPS instances from a compiled code and it is the basis for the Python and Fortran modules. Almost all functions of the C language API require an argument containing a “handle” in the form of a void * type variable, which points to the location of a LAMMPS class instance.

The library.h header file by default includes the mpi.h header for an MPI library, so it must be present when compiling code using the library interface. This usually must be the header from the same MPI library as the LAMMPS library was compiled with. The exception is when LAMMPS was compiled in serial mode using the STUBS MPI library. In that case the calling code may be compiled with a different MPI library for as long as lammps_open_no_mpi() is called to create a LAMMPS instance. Then you may set the define -DLAMMPS_LIB_NO_MPI when compiling your code and the inclusion of mpi.h will be skipped and consequently the function lammps_open() may not be used.
Errors versus exceptions

If any of the function calls in the LAMMPS library API will trigger an error inside LAMMPS, this will result in an abort of the entire program. This is not always desirable. Instead, LAMMPS can be compiled to instead throw a C++ exception.

**Warning:** No checks are made on the arguments of the function calls of the C library interface. *All* function arguments must be non-NULL unless explicitly allowed and point to consistent and valid data. Buffers for storing returned data must be allocated to a suitable size. Passing invalid or unsuitable information will likely cause crashes or corrupt data.

14.1.1 Creating or deleting a LAMMPS object

The *lammps_open()* and *lammps_open_no_mpi()* functions are used to create and initialize a LAMMPS() instance. The calling program has to provide a handle where a reference to this instance can be stored and which has to be used in all subsequent function calls until that instance is destroyed by calling *lammps_close()*.

Here is a simple example demonstrating its use:

```c
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
    int version;
    const char *lmpargv[] = { "liblammps", "-log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    /* create LAMMPS instance */
    handle = lammps_open_no_mpi(lmpargc, lmpargv, NULL);
    if (handle == NULL) {
        printf("LAMMPS initialization failed\n");
        lammps_mpi_finalize();
        return 1;
    }

    /* get and print numerical version code */
    version = lammps_version(handle);
    printf("LAMMPS Version: %d\n",version);

    /* delete LAMMPS instance and shut down MPI */
    lammps_close(handle);
    lammps_mpi_finalize();
    return 0;
}
```

The LAMMPS library will be using the MPI library it was compiled with and will either run on all processors in the `MPI_COMM_WORLD` communicator or on the set of processors in the communicator given in the `comm` argument of *lammps_open()*.

This means the calling code can run LAMMPS on all or a subset of processors. For example, a wrapper code might decide to alternate between LAMMPS and another code, allowing them both to run on all the processors. Or it might allocate part of the processors to LAMMPS and the rest to the other code by creating a custom
communicator with MPI_Comm_split() and running both codes concurrently before syncing them up periodically. Or it might instantiate multiple instances of LAMMPS to perform different calculations and either alternate between them, run them concurrently on split communicators, or run them one after the other. The lammps_open() function may be called multiple times for this latter purpose.

The lammps_close() function is used to shut down the LAMMPS class pointed to by the handle passed as an argument and free all its memory. This has to be called for every instance created with any of the lammps_open() functions. It will, however, not call MPI_Finalize(), since that may only be called once. See lammps_mpi_finalize() for an alternative to calling MPI_Finalize() explicitly in the calling program.

The lammps_free() function is a clean-up function to free memory that the library allocated previously via other function calls. See below for notes in the descriptions of the individual commands where such memory buffers were allocated.

```c
void *lammps_open(int argc, char **argv, MPI_Comm comm, void **ptr)
```

Create instance of the LAMMPS class and return pointer to it.

The lammps_open() function creates a new LAMMPS class instance while passing in a list of strings as if they were command-line arguments for the LAMMPS executable, and an MPI communicator for LAMMPS to run under. Since the list of arguments is exactly as when called from the command line, the first argument would be the name of the executable and thus is otherwise ignored. However argc may be set to 0 and then argv may be NULL. If MPI is not yet initialized, MPI_Init() will be called during creation of the LAMMPS class instance.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument ptr.

Deprecated since version 18Sep2020: The ptr argument will be removed in a future release of LAMMPS. It should be set to NULL instead.

**Note:** This function is not declared when the code linking to the LAMMPS library interface is compiled with -DLAMMPS_LIB_NO_MPI, or contains a #define LAMMPS_LIB_NO_MPI 1 statement before #include "library.h". In that case, you must use the lammps_open_no_mpi() function.

**See also** lammps_open_no_mpi(), lammps_open_fortran()

**Return** pointer to new LAMMPS instance cast to void *

**Parameters**

- **argc**: number of command line arguments
- **argv**: list of command line argument strings
- **comm**: MPI communicator for this LAMMPS instance
- **ptr**: pointer to a void pointer variable which serves as a handle; may be NULL

```c
void *lammps_open_no_mpi(int argc, char **argv, void **ptr)
```
Variant of ``lammps_open()`` that implicitly uses ``MPI_COMM_WORLD``.

This function is a version of `lammps_open()`, that is missing the MPI communicator argument. It will use `MPI_COMM_WORLD` instead. The type and purpose of arguments and return value are otherwise the same.

Outside of the convenience, this function is useful, when the LAMMPS library was compiled in serial mode, but the calling code runs in parallel and the `MPI_Comm` data type of the STUBS library would not be compatible with that of the calling code.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument `ptr`.

Deprecated since version 18Sep2020: The `ptr` argument will be removed in a future release of LAMMPS. It should be set to `NULL` instead.

*See also* `lammps_open()`, `lammps_open_fortran()`

**Return** pointer to new LAMMPS instance cast to `void *`

**Parameters**

- `argc`: number of command line arguments
- `argv`: list of command line argument strings
- `ptr`: pointer to a void pointer variable which serves as a handle; may be `NULL`

---

```c
void *lammps_open_fortran(int argc, char **argv, int f_comm)
```

Variant of ``lammps_open()`` using a Fortran MPI communicator.

This function is a version of `lammps_open()`, that uses an integer for the MPI communicator as the MPI Fortran interface does. It is used in the `lammps()` constructor of the LAMMPS Fortran module. Internally it converts the `f_comm` argument into a C-style MPI communicator with `MPI_Comm_f2c()` and then calls `lammps_open()`.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

*See also* `lammps_open_fortran()`, `lammps_open_no_mpi()`

**Return** pointer to new LAMMPS instance cast to `void *`

**Parameters**

- `argc`: number of command line arguments
- `argv`: list of command line argument strings
- `f_comm`: Fortran style MPI communicator for this LAMMPS instance

---

```c
void lammps_close(void *handle)
```

Chapter 14. LAMMPS Library Interfaces
Delete a LAMMPS instance created by lammps_open() or its variants.

This function deletes the LAMMPS class instance pointed to by handle that was created by one of the lammps_open() variants. It does not call MPI_Finalize() to allow creating and deleting multiple LAMMPS instances concurrently or sequentially. See lammps_mpi_finalize() for a function performing this operation.

Parameters

- handle: pointer to a previously created LAMMPS instance

void lammps_mpi_init()

Ensure the MPI environment is initialized.

The MPI standard requires that any MPI application must call MPI_Init() exactly once before performing any other MPI function calls. This function checks, whether MPI is already initialized and calls MPI_Init() in case it is not.

void lammps_mpi_finalize()

Shut down the MPI infrastructure.

The MPI standard requires that any MPI application calls MPI_Finalize() before exiting. Even if a calling program does not do any MPI calls, MPI is still initialized internally to avoid errors accessing any MPI functions. This function should then be called right before exiting the program to wait until all (parallel) tasks are completed and then MPI is cleanly shut down. After this function no more MPI calls may be made.

void lammps_free(void *ptr)

Free memory buffer allocated by LAMMPS.

Some of the LAMMPS C library interface functions return data as pointer to a buffer that has been allocated by LAMMPS or the library interface. This function can be used to delete those in order to avoid memory leaks.

Parameters

- ptr: pointer to data allocated by LAMMPS

### 14.1.2 Executing LAMMPS commands

Once a LAMMPS instance is created, there are multiple ways to “drive” a simulation. In most cases it is easiest to process single or multiple LAMMPS commands like in an input file. This can be done through reading a file or passing single commands or lists of commands or blocks of commands with the following functions.

Via these functions, the calling code can have the LAMMPS instance act on a series of input file commands that are either read from a file or passed as strings. This for, for example, allows to setup a problem from a template file and then run it in stages while performing other operations in between or concurrently. The caller can interleave
the LAMMPS function calls with operations it performs, calls to extract information from or set information within
LAMMPS, or calls to another code’s library.

Also equivalent to regular input script parsing is the handling of comments and expansion of variables with \$\{\text{name}\}
or \$\{\text{expression}\} syntax before the commands are parsed and executed. Below is a short example using some of
these functions.

```c
#include "library.h"
#include <mpi.h>
#include <stdio.h>

int main(int argc, char **argv)
{
  void *handle;
  int i;

  MPI_Init(&argc, &argv);
  handle = lammps_open(0, NULL, MPI_COMM_WORLD, NULL);
  lammps_file(handle,"in.sysinit");
  lammps_command(handle,"run 1000 post no");

  for (i=0; i < 100; ++i) {
    lammps_commands_string(handle,"run 100 pre no post no\n"
      "print 'PE = $(pe)'
      "print 'KE = $(ke)'");
  }
  lammps_close(handle);
  MPI_Finalize();
  return 0;
}
```

void **lammps_file** (void *handle, const char *filename)

Process LAMMPS input from a file.

This function processes commands in the file pointed to by filename line by line and thus functions very similar
to the include command. The function returns when the end of the file is reached and the commands have
completed.

The actual work is done by the functions Input::file(const char *) and Input::file().

**Parameters**

- handle: pointer to a previously created LAMMPS instance
- filename: name of a file with LAMMPS input

char **lammps_command** (void *handle, const char *cmd)

Process a single LAMMPS input command from a string.

This function tells LAMMPS to execute the single command in the string cmd. The entire string is con-
sidered as command and need not have a (final) newline character. Newline characters in the body of the
string, however, will be treated as part of the command and will not start a second command. The function
lammps_commands_string() processes a string with multiple command lines.

The function returns the name of the command on success or NULL when passing a string without a command.
Return: string with parsed command name or NULL

Parameters

- **handle**: pointer to a previously created LAMMPS instance
- **cmd**: string with a single LAMMPS command

```c
void lammps_commands_list(void *handle, int ncmd, const char **cmds)
```

Process multiple LAMMPS input commands from list of strings.

This function processes multiple commands from a list of strings by first concatenating the individual strings in `cmds` into a single string, inserting newline characters as needed. The combined string is passed to `lammps_commands_string()` for processing.

Parameters

- **handle**: pointer to a previously created LAMMPS instance
- **ncmd**: number of lines in `cmds`
- **cmds**: list of strings with LAMMPS commands

```c
void lammps_commands_string(void *handle, const char *str)
```

Process a block of LAMMPS input commands from a single string.

This function processes a multi-line string similar to a block of commands from a file. The string may have multiple lines (separated by newline characters) and also single commands may be distributed over multiple lines with continuation characters ('&'). Those lines are combined by removing the ‘&’ and the following newline character. After this processing the string is handed to LAMMPS for parsing and executing.

**Note:** Multi-line commands enabled by triple quotes will NOT work with this function.

Parameters

- **handle**: pointer to a previously created LAMMPS instance
- **str**: string with block of LAMMPS input commands

### 14.1.3 Retrieving or setting LAMMPS system properties

The library interface allows to extract different kinds of information about the active simulation instance and also to modify some of it. This enables combining MD simulation steps with other processing and simulation methods computed in the calling code or another code that is coupled to LAMMPS via the library interface. In some cases the data returned is direct reference to the original data inside LAMMPS cast to a void pointer. In that case the data needs to be cast to a suitable pointer to be able to access it, and you need to know the correct dimensions and lengths. When accessing per-atom data, please note that this data is the per-processor **local** data and indexed accordingly. These arrays can change sizes and order at every neighbor list rebuild and atom sort event as atoms are migrating between sub-domains.
```c
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
  void *handle;
  int i;

  handle = lammps_open_no_mpi(0, NULL, NULL);
  lammps_file(handle,"in.sysinit");
  printf("running simulation with %g atoms
",
         lammps_get_natoms(handle));

  lammps_command(handle,"run 1000 post no");

  for (i=0; i < 10; ++i) {
    lammps_command(handle,"run 100 pre no post no");
    printf("PE = %g
KE = %g
",
            lammps_get_thermo(handle,"pe"),
            lammps_get_thermo(handle,"ke"));
  }

  lammps_close(handle);
  return 0;
}
```

The `lammps_version()` function returns an integer representing the version of the LAMMPS code in the format YYYYMMDD. This can be used to implement backward compatibility in software using the LAMMPS library interface. The specific format guarantees, that this version number is growing with every new LAMMPS release.

**Return** an integer representing the version data in the format YYYYMMDD

**Parameters**
- handle: pointer to a previously created LAMMPS instance

This function will retrieve memory usage information for the current LAMMPS instance or process. The `meminfo` buffer will be filled with 3 different numbers (if supported by the operating system). The first is the tally (in MBytes) of all large memory allocations made by LAMMPS. This is a lower boundary of how much memory is requested and does not account for memory allocated on the stack or allocations via `new`. The second number is the current memory allocation of the current process as returned by a memory allocation reporting in the system library. The third number is the maximum amount of RAM (not swap) used by the process so far. If any of the two latter parameters is not supported by the operating system it will be set to zero.

**Parameters**
- handle: pointer to a previously created LAMMPS instance
- meminfo: memory usage information buffer

**LAMMPS Documentation**

- **handle**: pointer to a previously created LAMMPS instance
- **meminfo**: buffer with space for at least 3 double to store data in.

```c
int lammps_get_mpi_comm(void *handle)
```

Return current LAMMPS world communicator as integer.

This will take the LAMMPS “world” communicator and convert it to an integer using MPI_Comm_c2f(), so it is equivalent to the corresponding MPI communicator in Fortran. This way it can be safely passed around between different programming languages. To convert it to the C language representation use MPI_Comm_f2c().

If LAMMPS was compiled with MPI_STUBS, this function returns -1.

**See also** lammps_openFortran()

**Return** Fortran representation of the LAMMPS world communicator

**Parameters**

- **handle**: pointer to a previously created LAMMPS instance

```c
double lammps_get_natoms(void *handle)
```

Return the total number of atoms in the system.

This number may be very large when running large simulations across multiple processors. Depending on compile time choices, LAMMPS may be using either 32-bit or a 64-bit integer to store this number. For portability this function returns thus a double precision floating point number, which can represent up to a 53-bit signed integer exactly ($\approx 10^{16}$).

As an alternative, you can use lammps_extract_global() and cast the resulting pointer to an integer pointer of the correct size and dereference it. The size of that integer (in bytes) can be queried by calling lammps_extract_setting() to return the size of a bigint integer.

Changed in version 18Sep2020: The type of the return value was changed from int to double to accommodate reporting atom counts for larger systems that would overflow a 32-bit int without having to depend on a 64-bit bit integer type definition.

**Return** total number of atoms or 0 if value is too large

**Parameters**

- **handle**: pointer to a previously created LAMMPS instance

```c
double lammps_get_thermo(void *handle, const char *keyword)
```

Get current value of a thermo keyword.

This function returns the current value of a thermo keyword. Unlike lammps_extract_global() it does not give access to the storage of the desired data but returns its value as a double, so it can also return information that is computed on-the-fly.

14.1. LAMMPS C Library API
Return value of the requested thermo property or 0.0

Parameters

- handle: pointer to a previously created LAMMPS instance
- keyword: string with the name of the thermo keyword

```c
void lammps_extract_box (void *handle, double *boxlo, double *boxhi, double *xy, double *yz, double *xz, int *pflags, int *boxflag)
```

Extract simulation box parameters.

This function (re-)initializes the simulation box and boundary information and then assign the designated data to the locations in the pointers passed as arguments. Any argument (except the first) may be a NULL pointer and then will not be assigned.

Parameters

- handle: pointer to a previously created LAMMPS instance
- boxlo: pointer to 3 doubles where the lower box boundary is stored
- boxhi: pointer to 3 doubles where the upper box boundary is stored
- xy: pointer to a double where the xy tilt factor is stored
- yz: pointer to a double where the yz tilt factor is stored
- xz: pointer to a double where the xz tilt factor is stored
- pflags: pointer to 3 ints, set to 1 for periodic boundaries and 0 for non-periodic
- boxflag: pointer to an int, which is set to 1 if the box will be changed during a simulation by a fix and 0 if not.

```c
void lammps_reset_box (void *handle, double *boxlo, double *boxhi, double xy, double yz, double xz)
```

Reset simulation box parameters.

This function sets the simulation box dimensions (upper and lower bounds and tilt factors) from the provided data and then re-initializes the box information and all derived settings.

Parameters

- handle: pointer to a previously created LAMMPS instance
- boxlo: pointer to 3 doubles containing the lower box boundary
- boxhi: pointer to 3 doubles containing the upper box boundary
- xy: xy tilt factor
- yz: yz tilt factor
- xz: xz tilt factor

```c
int lammps_extract_setting (void *handle, const char *keyword)
```
Query LAMMPS about global settings.

This function will retrieve or compute global properties. In contrast to `lammps_get_thermo()` this function returns an int. The following keywords are currently supported. If a keyword is not recognized, the function returns -1.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description / Return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>bigint</td>
<td>size of the bigint integer type, 4 or 8 bytes. Set at compile time.</td>

See also `lammps_extract_global()`

**Return** value of the queried setting or -1 if unknown

**Parameters**

- handle: pointer to a previously created LAMMPS instance
- keyword: string with the name of the thermo keyword

```c
int lammps_extract_global_datatype(void *handle, const char *name)
```

Get data type of internal global LAMMPS variables or arrays.

This function returns an integer that encodes the data type of the global property with the specified name. See `_LMP_DATATYPE_CONST` for valid values. Callers of `lammps_extract_global()` can use this information to then decide how to cast the (void*) pointer and access the data.

**Return** integer constant encoding the data type of the property or -1 if not found.

**Parameters**

- handle: pointer to a previously created LAMMPS instance
- name: string with the name of the extracted property

```c
void *lammps_extract_global(void *handle, const char *name)
```
Get pointer to internal global LAMMPS variables or arrays.

This function returns a pointer to the location of some global property stored in one of the constituent classes of a LAMMPS instance. The returned pointer is cast to void * and needs to be cast to a pointer of the type that the entity represents. The pointers returned by this function are generally persistent; therefore it is not necessary to call the function again, unless a clear command command is issued which wipes out and recreates the contents of the LAMMPS class.

Please also see lammps_extract_setting(), lammps_get_thermo(), and lammps_extract_box().

Warning: Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures or crashes or bogus simulations. In general it is thus usually better to use a LAMMPS input command that sets or changes these parameters. Those will takes care of all side effects and necessary updates of settings derived from such settings. Where possible a reference to such a command or a relevant section of the manual is given below.

This table lists the supported names, their data types, length of the data area, and a short description. The bigint type may be defined to be either an int or an int64_t. This is selected at compile time and can be queried through calling lammps_extract_setting().

Return pointer (cast to void *) to the location of the requested property. NULL if name is not known.

Parameters

- handle: pointer to a previously created LAMMPS instance
- name: string with the name of the extracted property

```c
int lammps_extract_atom_datatype(void *handle, const char *name)
```

Get data type of a LAMMPS per-atom property.

This function returns an integer that encodes the data type of the per-atom property with the specified name. See _LMP_DATATYPE_CONST for valid values. Callers of lammps_extract_atom() can use this information to then decide how to cast the (void*) pointer and access the data.

Return integer constant encoding the data type of the property or -1 if not found.

Parameters

- handle: pointer to a previously created LAMMPS instance
- name: string with the name of the extracted property

```c
void *lammps_extract_atom(void *handle, const char *name)
```

Get pointer to a LAMMPS per-atom property.

This function returns a pointer to the location of per-atom properties (and per-atom-type properties in the case of the ‘mass’ keyword). Per-atom data is distributed across sub-domains and thus MPI ranks. The returned pointer is cast to void * and needs to be cast to a pointer of data type that the entity represents.
A table with supported keywords is included in the documentation of the `Atom::extract()` function.

**Warning:** The pointers returned by this function are generally not persistent since per-atom data may be re-distributed, re-allocated, and re-ordered at every re-neighboring operation.

**Return** pointer (cast to `void *`) to the location of the requested data or `NULL` if not found.

**Parameters**

- `handle`: pointer to a previously created LAMMPS instance
- `name`: string with the name of the extracted property

```c
int lammps_create_atoms( void *handle, int n, int *id, int *type, double *x, double *v, int *image, int bexpand)
```

Create N atoms from list of coordinates

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```c
int lammps_create_atoms(void *handle, int n, int64_t *id, int *type, double *x, double *v, int64_t *image, int bexpand);
```

This function creates additional atoms from a given list of coordinates and a list of atom types. Additionally the atom-IDs, velocities, and image flags may be provided. If atom-IDs are not provided, they will be automatically created as a sequence following the largest existing atom-ID.

This function is useful to add atoms to a simulation or - in tandem with `lammps_reset_box()` - to restore a previously extracted and saved state of a simulation. Additional properties for the new atoms can then be assigned via the `lammps_scatter_atoms()` functions.

For non-periodic boundaries, atoms will not be created that have coordinates outside the box unless it is a shrink-wrap boundary and the shrinkexceed flag has been set to a non-zero value. For periodic boundaries atoms will be wrapped back into the simulation cell and its image flags adjusted accordingly, unless explicit image flags are provided.

The function returns the number of atoms created or -1 on failure, e.g. when called before as box has been created.

Coordinates and velocities have to be given in a 1d-array in the order \(X(1),Y(1),Z(1),X(2),Y(2),Z(2),\ldots,X(N),Y(N),Z(N)\).

**Return** number of atoms created on success; -1 on failure (no box, no atom IDs, etc.)

**Parameters**

- `handle`: pointer to a previously created LAMMPS instance
- `n`: number of atoms, \(N\), to be added to the system
- `id`: pointer to \(N\) atom IDs; `NULL` will generate IDs
- `type`: pointer to \(N\) atom types (required)
- `x`: pointer to \(3N\) doubles with \(x\)-,\(y\)-,\(z\)- positions of the new atoms (required)
- `v`: pointer to \(3N\) doubles with \(x\)-,\(y\)-,\(z\)- velocities of the new atoms (set to 0.0 if `NULL`)
- `image`: pointer to \(N\) imageint sets of image flags, or `NULL`
• `bexpand`: if 1, atoms outside of shrink-wrap boundaries will still be created and not dropped and the box extended

### 14.1.4 Retrieving or setting properties of LAMMPS objects

This section documents accessing or modifying data from objects like computes, fixes, or variables in LAMMPS.

```c
void *lammps_extract_compute (void *handle, char *id, int, int)
```

Get pointer to data from a LAMMPS compute.

This function returns a pointer to the location of data provided by a `compute command` instance identified by the compute-ID. Computes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array or they may provide the information about the dimensions of the respective data. Since computes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines what kind of pointer the returned pointer needs to be cast to access the data correctly. The function returns `NULL` if the compute ID is not found or the requested data is not available or current. The following table lists the available options.

<table>
<thead>
<tr>
<th>Style</th>
<th>Type</th>
<th>Returned type</th>
<th>Returned data</th>
</tr>
</thead>
<tbody>
<tr>
<td>LMP_STYLE_GLOBAL</td>
<td>LMP_TYPE_SCALAR</td>
<td>double *</td>
<td>Global scalar</td>
</tr>
<tr>
<td>LMP_STYLE_GLOBAL</td>
<td>LMP_TYPE_VECTOR</td>

<tr>
<td>LMP_STYLE_LOCAL</td>
<td>LMP_TYPE_ARRAY</td>
<td>double **</td>
<td>Local data array</td>
</tr>
<tr>
<td>LMP_STYLE_LOCAL</td>
<td>LMP_SIZE_ROWS</td>
<td>int *</td>
<td>Number of local data rows</td>
</tr>
<tr>
<td>LMP_STYLE_LOCAL</td>
<td>LMP_SIZE_COLS</td>
<td>int *</td>
<td>Number of local data columns</td>
</tr>
</tbody>
</table>

**Warning:** The pointers returned by this function are generally not persistent since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation. It is advisable to re-invoke this function before the data is accessed, or make a copy if the data shall be used after other LAMMPS commands have been issued.

**Note:** If the compute’s data is not computed for the current step, the compute will be invoked. LAMMPS cannot easily check at that time, if it is valid to invoke a compute, so it may fail with an error. The caller has to check to avoid such an error.
Return pointer (cast to `void *`) to the location of the requested data or `NULL` if not found.

**Parameters**

- `handle`: pointer to a previously created LAMMPS instance
- `id`: string with ID of the compute
- `style`: constant indicating the style of data requested (global, per-atom, or local)
- `type`: constant indicating type of data (scalar, vector, or array) or size of rows or columns

```c
void *lammps_extract_fix(void *handle, char*, int, int, int, int)
```

This function returns a pointer to data provided by a fix command instance identified by its fix-ID. Fixes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array, or they may provide the information about the dimensions of the respective data. Since individual fixes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines to what kind of pointer the returned pointer needs to be cast to access the data correctly. The function returns `NULL` if the fix ID is not found or the requested data is not available.

**Note:** When requesting global data, the fix data can only be accessed one item at a time without access to the pointer itself. Thus this function will allocate storage for a single double value, copy the returned value to it, and returns a pointer to the location of the copy. Therefore the allocated storage needs to be freed after its use to avoid a memory leak. Example:

```c
double *dptr = (double *) lammps_extract_fix(handle, name, 0, 1, 0, 0);
double value = *dptr;
lammps_free((void *)dptr);
```

The following table lists the available options.
<table>
<thead>
<tr>
<th>Style</th>
<th>Type</th>
<th>Returned type</th>
<th>Returned data</th>
</tr>
</thead>
<tbody>
<tr>
<td>LMP_STYLE_GLOBAL</td>
<td>LMP_TYPE_SCALAR</td>
<td>double *</td>
<td>Copy of global scalar</td>
</tr>
<tr>
<td>LMP_STYLE_GLOBAL</td>
<td>LMP_TYPE_VECTOR</td>

<td>int *</td>
<td>Length of global vector</td>
</tr>
<tr>
<td>LMP_STYLE_GLOBAL</td>
<td>LMP_SIZE_ROWS</td>
<td>int *</td>
<td>Rows in global array</td>
</tr>
<tr>
<td>LMP_STYLE_GLOBAL</td>
<td>LMP_SIZE_COLS</td>
<td>int *</td>
<td>Columns in global array</td>
</tr>
<tr>
<td>LMP_STYLE_ATOM</td>
<td>LMP_TYPE_VECTOR</td>
<td>double *</td>
<td>Per-atom value</td>
</tr>
<tr>
<td>LMP_STYLE_ATOM</td>
<td>LMP_TYPE_ARRAY</td>
<td>double **</td>
<td>Per-atom vector</td>
</tr>
<tr>
<td>LMP_STYLE_ATOM</td>
<td>LMP_SIZE_COLS</td>
<td>int *</td>
<td>Columns of per-atom array, 0 if vector</td>
</tr>
<tr>
<td>LMP_STYLE_LOCAL</td>
<td>LMP_TYPE_VECTOR</td>
<td>double *</td>
<td>Local data vector</td>
</tr>
<tr>
<td>LMP_STYLE_LOCAL</td>
<td>LMP_TYPE_ARRAY</td>
<td>double **</td>
<td>Local data array</td>
</tr>
<tr>
<td>LMP_STYLE_LOCAL</td>
<td>LMP_SIZE_ROWS</td>
<td>int *</td>
<td>Number of local data rows</td>
</tr>
<tr>
<td>LMP_STYLE_LOCAL</td>
<td>LMP_SIZE_COLS</td>
<td>int *</td>
<td>Number of local data columns</td>
</tr>
</tbody>
</table>

**Warning:** The pointers returned by this function for per-atom or local data are generally not persistent, since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation of the fix. It is thus advisable to re-invoke this function before the data is accessed, or make a copy, if the data shall be used after other LAMMPS commands have been issued.

**Note:** LAMMPS cannot easily check if it is valid to access the data, so it may fail with an error. The caller has to avoid such an error.

**Return** pointer (cast to `void *`) to the location of the requested data or `NULL` if not found.

**Parameters**
- `handle`: pointer to a previously created LAMMPS instance
- `id`: string with ID of the fix
- `style`: constant indicating the style of data requested (global, per-atom, or local)
- `type`: constant indicating type of data (scalar, vector, or array) or size of rows or columns
- `nrow`: row index (only used for global vectors and arrays)
- `ncol`: column index (only used for global arrays)

```c
void *lammps_extract_variable (void *handle, char*, char*)
```
Get pointer to data from a LAMMPS variable.

This function returns a pointer to data from a LAMMPS variable command identified by its name. The variable must be either an equal-style compatible or an atom-style variable. Variables of style internal are compatible with equal-style variables and so are python-style variables, if they return a numeric value. The function returns NULL when a variable of the provided name is not found or of an incompatible style. The group argument is only used for atom-style variables and ignored otherwise. If set to NULL when extracting data from and atom-style variable, the group is assumed to be “all”.

**Note:** When requesting data from an equal-style or compatible variable this function allocates storage for a single double value, copies the returned value to it, and returns a pointer to the location of the copy. Therefore the allocated storage needs to be freed after its use to avoid a memory leak. Example:

```c
double *dptr = (double *) lammps_extract_variable(handle, name, NULL);
double value = *dptr;
lammps_free((void *)dptr);
```

For atom-style variables the data returned is a pointer to an allocated block of storage of double of the length atom->nlocal. To avoid a memory leak, also this pointer needs to be freed after use.

Since the data is returned as copies, the location will persist, but its values will not be updated, in case the variable is re-evaluated.

**Note:** LAMMPS cannot easily check if it is valid to access the data referenced by the variables, e.g. computes or fixes or thermodynamic info, so it may fail with an error. The caller has to make certain, that the data is extracted only when it safe to evaluate the variable and thus an error and crash is avoided.

**Return** pointer (cast to void *) to the location of the requested data or NULL if not found.

**Parameters**
- handle: pointer to a previously created LAMMPS instance
- name: name of the variable
- group: group-ID for atom style variable or NULL

```c
int lammps_set_variable (void*, char*, char*)
```

Set the value of a string-style variable.

This function assigns a new value from the string str to the string-style variable name. Returns -1 if a variable of that name does not exist or is not a string-style variable, otherwise 0.

**Return** 0 on success or -1 on failure

**Parameters**
- handle: pointer to a previously created LAMMPS instance
- name: name of the variable
- str: new value of the variable
enum _LMP_DATATYPE_CONST
  Data type constants for extracting data from atoms, computes and fixes
  Must be kept in sync with the equivalent constants in lammps.py
  Values:

  enumerator LAMMPS_INT
    32-bit integer (array)

  enumerator LAMMPS_INT_2D
    two-dimensional 32-bit integer array

  enumerator LAMMPS_DOUBLE
    64-bit double (array)

  enumerator LAMMPS_DOUBLE_2D
    two-dimensional 64-bit double array

  enumerator LAMMPS_INT64
    64-bit integer (array)

  enumerator LAMMPS_INT64_2D
    two-dimensional 64-bit integer array

  enumerator LAMMPS_STRING
    C-String

enum _LMP_STYLE_CONST
  Style constants for extracting data from computes and fixes.
  Must be kept in sync with the equivalent constants in lammps.py
  Values:

  enumerator LMP_STYLE_GLOBAL
    return global data

  enumerator LMP_STYLE_ATOM
    return per-atom data

  enumerator LMP_STYLE_LOCAL
    return local data

enum _LMP_Type CONST
  Type and size constants for extracting data from computes and fixes.
  Must be kept in sync with the equivalent constants in lammps.py
  Values:

  enumerator LMP_TYPE_SCALAR
    return scalar

  enumerator LMP_TYPE_VECTOR
    return vector

  enumerator LMP_TYPE_ARRAY
    return array

  enumerator LMP_SIZE_VECTOR
    return length of vector

  enumerator LMP_SIZE_ROWS
    return number of rows
enumerator LMP_SIZE_COLS
    return number of columns

14.1.5 Library functions for scatter/gather operations

void lammps_gather_atoms (void*, char*, int, int, void*)

void lammps_gather_atoms_concat (void*, char*, int, int, void*)

void lammps_gather_atoms_subset (void*, char*, int, int, int*, void*)

void lammps_scatter_atoms (void*, char*, int, int, void*)

void lammps_scatter_atoms_subset (void*, char*, int, int, int*, void*)

14.1.6 Accessing LAMMPS Neighbor lists

The following functions allow to access neighbor lists generated by LAMMPS or query their properties.

int lammps_find_compute_neighlist (void*, char*, int)
    Find neighbor list index of compute neighbor list

    Return  return neighbor list index if found, otherwise -1

    Parameters
        • handle: pointer to a previously created LAMMPS instance cast to void *.
        • id: Identifier of fix instance
        • request: request index that specifies which request should be returned, in case there are multiple neighbor lists for this fix

int lammps_find_fix_neighlist (void*, char*, int)
    Find neighbor list index of fix neighbor list

    Return  return neighbor list index if found, otherwise -1

    Parameters
        • handle: pointer to a previously created LAMMPS instance cast to void *.
        • id: Identifier of fix instance
        • request: request index that specifies which request should be returned, in case there are multiple neighbor lists for this fix
int lammps_find_pair_neighlist (void*, char*, int, int, int)
Find neighbor list index of pair style neighbor list

Try finding pair instance that matches style. If exact is set, the pair must match style exactly. If exact is 0, style
must only be contained. If pair is of style pair/hybrid, style is instead matched the nsub-th hybrid sub-style.

Once the pair instance has been identified, multiple neighbor list requests may be found. Every neighbor list is
uniquely identified by its request index. Thus, providing this request index ensures that the correct neighbor list
index is returned.

**Return**  return neighbor list index if found, otherwise -1

**Parameters**
- **handle**: pointer to a previously created LAMMPS instance cast to void *
- **style**: String used to search for pair style instance
- **exact**: Flag to control whether style should match exactly or only must be contained in pair style
  name
- **nsub**: match nsub-th hybrid sub-style
- **request**: request index that specifies which neighbor list should be returned, in case there are
  multiple neighbor lists requests for the found pair style

int lammps_neighlist_num_elements (void*, int)
Return the number of entries in the neighbor list with given index

**Return**  return number of entries in neighbor list, -1 if idx is not a valid index

**Parameters**
- **handle**: pointer to a previously created LAMMPS instance cast to void *
- **idx**: neighbor list index

void lammps_neighlist_element_neighbors (void*, int, int, int*, int*, int**)
Return atom local index, number of neighbors, and array of neighbor local atom indices of neighbor list entry

**Parameters**
- **handle**: pointer to a previously created LAMMPS instance cast to void *
- **idx**: index of this neighbor list in the list of all neighbor lists
- **element**: index of this neighbor list entry
- **[out] iatom**: local atom index (i.e. in the range [0, nlocal + nghost), -1 if invalid idx or element
  value
- **[out] numneigh**: number of neighbors of atom iatom or 0
- **[out] neighbors**: pointer to array of neighbor atom local indices or NULL
14.1.7 Retrieving LAMMPS configuration information

The following library functions can be used to query the LAMMPS library about compile time settings and included packages and styles. This enables programs that use the library interface to run LAMMPS simulations to determine, whether the linked LAMMPS library is compatible with the requirements of the application without crashing during the LAMMPS functions (e.g. due to missing pair styles from packages) or to choose between different options (e.g. whether to use \texttt{lj/cut}, \texttt{lj/cut/opt}, \texttt{lj/cut/omp} or \texttt{lj/cut/intel}). Most of the functions can be called directly without first creating a LAMMPS instance. While crashes within LAMMPS may be recovered from through enabling exceptions, avoiding them proactively is a safer approach.

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv) {
    void *handle;
    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.missing");
    if (lammps_has_error(handle)) {
        char errmsg[256];
        int errtype;
        errtype = lammps_get_last_error_message(handle, errmsg, 256);
        fprintf(stderr, "LAMMPS failed with error: %s\n", errmsg);
        return 1;
    }
    /* write compressed dump file depending on available of options */
    if (lammps_has_style(handle, "dump", "atom/zstd")) {
        lammps_command(handle, "dump d1 all atom/zstd 100 dump.zst");
    } else if (lammps_has_style(handle, "dump", "atom/gz")) {
        lammps_command(handle, "dump d1 all atom/gz 100 dump.gz");
    } else if (lammps_config_has_gzip_support()) {
        lammps_command(handle, "dump d1 all atom 100 dump.gz");
    } else {
        lammps_command(handle, "dump d1 all atom 100 dump");
    }
    lammps_close(handle);
    return 0;
}
```

**int lammps_config_has_mpi_support()**

This function is used to query whether LAMMPS was compiled with a real MPI library or in serial.

**Return** 0 when compiled with MPI STUBS, otherwise 1

**int lammps_config_has_gzip_support()**

Check if the LAMMPS library supports compressed files via a pipe to \texttt{gzip}

Several LAMMPS commands (e.g. \texttt{read_data command}, \texttt{write_data command}, \texttt{dump styles atom, custom, and xyz}) support reading and writing compressed files via creating a pipe to the \texttt{gzip} program. This function checks whether this feature was enabled at compile time. It does not check whether the \texttt{gzip} itself is installed and usable.
Return 1 if yes, otherwise 0

int lammps_config_has_png_support()

Check if the LAMMPS library supports writing PNG format images

The LAMMPS dump style image supports writing multiple image file formats. Most of them need, however, support from an external library and using that has to be enabled at compile time. This function checks whether support for the PNG image file format is available in the current LAMMPS library.

Return 1 if yes, otherwise 0

int lammps_config_has_jpeg_support()

Check if the LAMMPS library supports writing JPEG format images

The LAMMPS dump style image supports writing multiple image file formats. Most of them need, however, support from an external library and using that has to be enabled at compile time. This function checks whether support for the JPEG image file format is available in the current LAMMPS library.

Return 1 if yes, otherwise 0

int lammps_config_has_ffmpeg_support()

Check if the LAMMPS library supports creating movie files via a pipe to ffmpeg

The LAMMPS dump style movie supports generating movies from images on-the-fly via creating a pipe to the ffmpeg program. This function checks whether this feature was enabled at compile time. It does not check whether the ffmpeg itself is installed and usable.

Return 1 if yes, otherwise 0

int lammps_config_has_exceptions()

Check whether LAMMPS errors will throw a C++ exception

In case of errors LAMMPS will either abort or throw a C++ exception. The latter has to be enabled at compile time. This function checks if exceptions were enabled.

Return 1 if yes, otherwise 0

int lammps_config_has_package(const char*)

Check if a specific package has been included in LAMMPS

This function checks if the LAMMPS library in use includes the specific LAMMPS package provided as argument.
LAMMPS Documentation

**Return** 1 if included, 0 if not.

**Parameters**
- name: string with the name of the package

```
int lammps_config_package_count()
```

Count the number of installed packages in the LAMMPS library.

This function counts how many LAMMPS packages are included in the LAMMPS library in use.

**Return** number of packages included

```
int lammps_config_package_name(int, char*, int)
```

Get the name of a package in the list of installed packages in the LAMMPS library.

This function copies the name of the package with the index \( idx \) into the provided C-style string buffer. The length of the buffer must be provided as `buf_size` argument. If the name of the package exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and `buffer` is set to an empty string, otherwise 1;

**Return** 1 if successful, otherwise 0

**Parameters**
- idx: index of the package in the list of included packages (0 <= idx < package count)
- buffer: string buffer to copy the name of the package to
- buf_size: size of the provided string buffer

```
int lammps_has_style(void*, const char*, const char*)
```

Check if a specific style has been included in LAMMPS

This function checks if the LAMMPS library in use includes the specific style of a specific category provided as an argument. Valid categories are: `atom`, `integrate`, `minimize`, `pair`, `bond`, `angle`, `dihedral`, `improper`, `kspace`, `compute`, `fix`, `region`, `dump`, and `command`.

**Return** 1 if included, 0 if not.

**Parameters**
- handle: pointer to a previously created LAMMPS instance cast to void *.
- category: category of the style
- name: name of the style

```
int lammps_style_count(void*, const char*)
```
Count the number of styles of category in the LAMMPS library.

This function counts how many styles in the provided category are included in the LAMMPS library in use. Please see `lammps_has_style()` for a list of valid categories.

**Return** number of styles in category

**Parameters**

- handle: pointer to a previously created LAMMPS instance cast to void *.
- category: category of styles

```c
int lammps_style_name(void*, const char*, int, char*, int)
```

Look up the name of a style by index in the list of style of a given category in the LAMMPS library.

This function copies the name of the package with the index `idx` into the provided C-style string buffer. The length of the buffer must be provided as `buf_size` argument. If the name of the package exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and `buffer` is set to an empty string, otherwise 1. Please see `lammps_has_style()` for a list of valid categories.

**Return** 1 if successful, otherwise 0

**Parameters**

- handle: pointer to a previously created LAMMPS instance cast to void *.
- category: category of styles
- idx: index of the package in the list of included packages (0 <= idx < style count)
- buffer: string buffer to copy the name of the style to
- buf_size: size of the provided string buffer

### 14.1.8 Library interface utility functions

To simplify some of the tasks, the library interface contains some utility functions that are not directly calling LAMMPS.

```c
int lammps_encode_image_flags(int ix, int iy, int iz)
```

Encode three integer image flags into a single imageint.

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```c
int64_t lammps_encode_image_flags(int ix, int iy, int iz);
```

This function performs the bit-shift, addition, and bit-wise OR operations necessary to combine the values of three integers representing the image flags in x-, y-, and z-direction. Unless LAMMPS is compiled with `-DLAMMPS_BIGBIG`, those integers are limited 10-bit signed integers [-512, 511]. Otherwise the return type changes from `int` to `int64_t` and the valid range for the individual image flags becomes [-1048576,1048575], i.e. that of a 21-bit signed integer. There is no check on whether the arguments conform to these requirements.
Return encoded image flag integer

Parameters

• \textit{ix}: image flag value in \textit{x}
• \textit{iy}: image flag value in \textit{y}
• \textit{iz}: image flag value in \textit{z}

\begin{verbatim}
void lammps_decode_image_flags (int image, int *flags)

Decode a single image flag integer into three regular integers

The prototype for this function when compiling with \texttt{-DLAMMPS_BIGBIG} is:

\begin{verbatim}
void lammps_decode_image_flags(int64_t image, int *flags);
\end{verbatim}

This function does the reverse operation of \texttt{lammps_encode_image_flags()} and takes an image flag integer does the bit-shift and bit-masking operations to decode it and stores the resulting three regular integers into the buffer pointed to by \textit{flags}.

Parameters

• \textit{image}: encoded image flag integer
• \textit{flags}: pointer to storage where the decoded image flags are stored.
\end{verbatim}

void lammps_set_fix_external_callback (void*, char*, FixExternalFnPtr, void*)

int lammps_has_error (void *handle)

Check if there is a (new) error message available

This function can be used to query if an error inside of LAMMPS has thrown a \textit{C++ exception}.

Return 0 on no error, 1 on error.

Parameters

• \textit{handle}: pointer to a previously created LAMMPS instance cast to \texttt{void *}.

int lammps_get_last_error_message (void *handle, char *buffer, int buf_size)

Copy the last error message into the provided buffer

This function can be used to retrieve the error message that was set in the event of an error inside of LAMMPS which resulted in a \textit{C++ exception}. A suitable buffer for a C-style string has to be provided and its length. If the internally stored error message is longer, it will be truncated accordingly. The return value of the function corresponds to the kind of error: a “1” indicates an error that occurred on all MPI ranks and is often recoverable, while a “2” indicates an abort that would happen only in a single MPI rank and thus may not be recoverable as other MPI ranks may be waiting on the failing MPI ranks to send messages.
Return 1 when all ranks had the error, 1 on a single rank error.

Parameters

- handle: pointer to a previously created LAMMPS instance cast to void *.
- buffer: string buffer to copy the error message to
- buf_size: size of the provided string buffer

14.1.9 Adding code to the Library interface

The functionality of the LAMMPS library interface has historically always been motivated by the needs of its users and functions were added or expanded as they were needed and used. Contributions to the interface are always welcome. However with a refactoring of the library interface and its documentation that started in 2020, there are now a few requirements for inclusion of changes.

- New functions should be orthogonal to existing ones and not implement functionality that can already be achieved with the existing APIs.
- All changes and additions should be documented with Doxygen style comments and references to those functions added to the corresponding files in the doc/src folder.
- If possible, new unit tests to test those new features should be added.
- The new feature should also be implemented and documented for the Python and Fortran modules.
- All additions should work and be compatible with -DLAMMPS_BIGBIG, -DLAMMPS_SMALLBIG, -DLAMMPS_SMALLSMALL and compiling with and without MPI support.
- The library.h file should be kept compatible to C code at a level similar to C89. Its interfaces may not reference any custom data types (e.g. bigint, tagint, and so on) only known inside of LAMMPS.
- only C style comments, not C++ style

Please note, that these are not strict requirements, but the LAMMPS developers appreciate if they are followed closely and will assist with implementing what is missing.

14.2 LAMMPS Python APIs

The LAMMPS Python module enables calling the LAMMPS C library API from Python by dynamically loading functions in the LAMMPS shared library through the Python ctypes module. Because of the dynamic loading, it is required that LAMMPS is compiled in “shared” mode. The Python interface is object oriented, but otherwise trying to be very similar to the C library API. Three different Python classes to run LAMMPS are available and they build on each other.
14.2.1 The `lammps` Python module

The LAMMPS Python interface is implemented as a module called `lammps` in the `lammps.py` file in the `python` folder of the LAMMPS source code distribution. After compilation of LAMMPS, the module can be installed into a Python system folder or a user folder with `make install-python`. Components of the module can then loaded into a Python session with the `import` command.

There are multiple Python interface classes in the `lammps` module:

- the `lammps` class. This is a wrapper around the C-library interface and its member functions try to replicate the C-library API closely. This is the most feature-complete Python API.
- the `PyLammps` class. This is a more high-level and more Python style class implemented on top of the `lammps` class.
- the `IPyLammps` class is derived from `PyLammps` and adds embedded graphics features to conveniently include LAMMPS into Jupyter notebooks.

14.2.2 Setting up a Python virtual environment

LAMMPS and its Python module can be installed together into a Python virtual environment. This lets you isolate your customized Python environment from your user or system installation. The following is a minimal working example:

```bash
# create and change into build directory
mkdir build
cd build

# create virtual environment
venv myenv

# Add venv lib folder to LD_LIBRARY_PATH when activating it
echo 'export LD_LIBRARY_PATH=$VIRTUAL_ENV/lib:$LD_LIBRARY_PATH' >> myenv/bin/activate

# Add LAMMPS_POTENTIALS path when activating venv
echo 'export LAMMPS_POTENTIALS=$VIRTUAL_ENV/share/lammps/potentials' >> myenv/bin/activate

# activate environment
source myenv/bin/activate

# configure LAMMPS compilation
# compiles as shared library with PYTHON package and C++ exceptions
# and installs into myvenv
(myenv)$ cmake -C ../cmake/presets/minimal.cmake -D BUILD_SHARED_LIBS=on -D PKG_PYTHON=on -D LAMMPS_EXCEPTIONS=on -D CMAKE_INSTALL_PREFIX=$VIRTUAL_ENV ../cmake

# compile LAMMPS
(myenv)$ cmake --build . --parallel

# install LAMMPS into myvenv
(myenv)$ cmake --install .
```
14.2.3 Creating or deleting a LAMMPS object

With the Python interface the creation of a LAMMPS instance is included in the constructors for the lammps, PyLammps, and PyLammps classes. Internally it will call either lammps_open() or lammps_open_no_mpi() from the C library API to create the class instance.

All arguments are optional. The name argument allows loading a LAMMPS shared library that is named liblammps_machine.so instead of the default name of liblammps.so. In most cases the latter will be installed or used. The ptr argument is for use of the lammps module from inside a LAMMPS instance, e.g. with the python command, where a pointer to the already existing LAMMPS class instance can be passed to the Python class and used instead of creating a new instance. The comm argument may be used in combination with the mpi4py module to pass an MPI communicator to LAMMPS and thus it is possible to run the Python module like the library interface on a subset of the MPI ranks after splitting the communicator.

Here are simple examples using all three Python interfaces:

### lammps API

```python
from lammps import lammps

# NOTE: argv[0] is set by the lammps class constructor
args = ["-log", "none"]
# create LAMMPS instance
lmp = lammps(cmdargs=args)
# get and print numerical version code
print("LAMMPS Version: ", lmp.version())
# explicitly close and delete LAMMPS instance (optional)
lmp.close()
```

### PyLammps API

The PyLammps class is a wrapper around the lammps class and all of its lower level functions. By default, it will create a new instance of lammps passing along all arguments to the constructor of lammps.

```python
from lammps import PyLammps

# NOTE: argv[0] is set by the lammps class constructor
args = ["-log", "none"]
# create LAMMPS instance
L = PyLammps(cmdargs=args)
# get and print numerical version code
print("LAMMPS Version: ", L.version())
# explicitly close and delete LAMMPS instance (optional)
L.close()
```

PyLammps objects can also be created on top of an existing lammps object:

```python
from lammps import lammps, PyLammps
...
# create LAMMPS instance
lmp = lammps(cmdargs=args)
# create PyLammps instance using previously created LAMMPS instance
L = PyLammps(ptr=lmp)
```

This is useful if you have to create the lammps instance in a specific way, but want to take advantage of
IPyLammps API

The IPyLammps class is an extension of the PyLammps class. It has the same construction behavior. By default, it will create a new instance of lammps passing along all arguments to the constructor of lammps.

```python
from lammps import IPyLammps
# NOTE: argv[0] is set by the lammps class constructor
args = ["-log", "none"]
# create LAMMPS instance
L = IPyLammps(cmdargs=args)
# get and print numerical version code
print("LAMMPS Version: ", L.version())
# explicitly close and delete LAMMPS instance (optional)
L.close()
```

You can also initialize IPyLammps on top of an existing lammps or PyLammps object:

```python
from lammps import lammps, IPyLammps
...
# create LAMMPS instance
lmp = lammps(cmdargs=args)
# create PyLammps instance using previously created LAMMPS instance
L = PyLammps(ptr=lmp)
```

This is useful if you have to create the lammps instance in a specific way, but want to take advantage of the IPyLammps interface.

In all of the above cases, same as with the C library API, this will use the MPI_COMM_WORLD communicator for the MPI library that LAMMPS was compiled with. The lmp.close() call is optional since the LAMMPS class instance will also be deleted automatically during the lammps class destructor.

### 14.2.4 Executing LAMMPS commands

Once an instance of the lammps, PyLammps, or IPyLammps class is created, there are multiple ways to “feed” it commands. In a way that is not very different from running a LAMMPS input script, except that Python has many more facilities for structured programming than the LAMMPS input script syntax. Furthermore it is possible to “compute” what the next LAMMPS command should be.

lammps API

Same as in the equivalent C library functions, commands can be read from a file, a single string, a list of strings and a block of commands in a single multi-line string. They are processed under the same boundary conditions as the C library counterparts. The example below demonstrates the use of lammps.file(), lammps.command(), lammps.commands_list(), and lammps.commands_string():

```python
from lammps import lammps
lmp = lammps()
# read commands from file 'in.melt'
lmp.file('in.melt')
```
# issue a single command
lmp.command('variable zpos index 1.0')
# create 10 groups with 10 atoms each
cmds = ["group q{} id {}::{}".format(i,10*i+1,10*(i+1)) for i in range(10)]
lmp.commands_list(cmds)
# run commands from a multi-line string
block = ""
clear
region box block 0 2 0 2 0 2
create_box 1 box
create_atoms 1 single 1.0 1.0 ${zpos}"
""
lmp.commands_string(block)

PyLammps/IPyLammps API

Unlike the lammps API, the PyLammps/IPyLammps APIs allow running LAMMPS commands by calling equivalent member functions.

For instance, the following LAMMPS command

```bash
region box block 0 10 0 5 -0.5 0.5
```

can be executed using the following Python code if `L` is a lammps instance:

```python
L.command("region box block 0 10 0 5 -0.5 0.5")
```

With the PyLammps interface, any LAMMPS command can be split up into arbitrary parts. These parts are then passed to a member function with the name of the command. For the `region` command that means the `region` method can be called. The arguments of the command can be passed as one string, or individually.

```python
L.region("box block", 0, 10, 0, 5, -0.5, 0.5)
```

In this example all parameters except the first are Python floating-point literals. The PyLammps interface takes the entire parameter list and transparently merges it to a single command string.

The benefit of this approach is avoiding redundant command calls and easier parameterization. In the original interface parameterization this needed to be done manually by creating formatted strings.

```python
L.command("region box block %f %f %f %f %f %f" % (xlo, xhi, ylo, yhi, zlo, zhi))
```

In contrast, methods of PyLammps accept parameters directly and will convert them automatically to a final command string.

```python
L.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```

Using these facilities, the example shown for the lammps API can be rewritten as follows:

```python
from lammps import PyLammps
L = PyLammps()
# read commands from file 'in.melt'
L.file('in.melt')
# issue a single command
```
L.Variable('zpos', 'index', 1.0)
# create 10 groups with 10 atoms each
for i in range(10):
    L.group(f'g{i}', 'id', f'{{10*i+1}:{10*(i+1)}}')
L.clear()
L.region("box block", 0, 2, 0, 2, 0, 2)
L.create_box(1, "box")
L.create_atoms(1, "single", 1.0, 1.0, "${zpos}"

14.2.5 The lammps class API

The lammps class is the core of the LAMMPS Python interfaces. It is a wrapper around the LAMMPS C library API using the Python ctypes module and a shared library compiled from the LAMMPS sources code. The individual methods in this class try to closely follow the corresponding C functions. The handle argument that needs to be passed to the C functions is stored internally in the class and automatically added when calling the C library functions. Below is a detailed documentation of the API.

class lammps.lammps(name='', cmdargs=None, ptr=None, comm=None)

Create an instance of the LAMMPS Python class.

This is a Python wrapper class that exposes the LAMMPS C-library interface to Python. It either requires that LAMMPS has been compiled as shared library which is then dynamically loaded via the ctypes Python module or that this module called from a Python function that is called from a Python interpreter embedded into a LAMMPS executable, for example through the python invoke command. When the class is instantiated it calls the lammps_open() function of the LAMMPS C-library interface, which in turn will create an instance of the LAMMPS C++ class. The handle to this C++ class is stored internally and automatically passed to the calls to the C library interface.

Parameters
• name (string) – “machine” name of the shared LAMMPS library (“mpi” loads liblammps_mpi.so, “” loads liblammps.so)
• cmdargs (list) – list of command line arguments to be passed to the lammps_open() function. The executable name is automatically added.
• ptr (pointer) – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
• comm (MPI_Comm) – MPI communicator (as provided by mpi4py). None means use MPI_COMM_WORLD implicitly.

property numpy
Convert between ctypes arrays and numpy arrays

close()
Explicitly delete a LAMMPS instance through the C-library interface.

This is a wrapper around the lammps_close() function of the C-library interface.

finalize()
Shut down the MPI communication through the library interface by calling lammps_finalize().
version()
Return a numerical representation of the LAMMPS version in use.
This is a wrapper around the lammps_close() function of the C-library interface.

Returns version number
Return type int

get_mpi_comm()
Get the MPI communicator in use by the current LAMMPS instance
This is a wrapper around the lammps_get_mpi_comm() function of the C-library interface. It will return None if either the LAMMPS library was compiled without MPI support or the mpi4py Python module is not available.

Returns MPI communicator
Return type MPI_Comm

file(path)
Read LAMMPS commands from a file.
This is a wrapper around the lammps_file() function of the C-library interface. It will open the file with the name/path file and process the LAMMPS commands line by line until the end. The function will return when the end of the file is reached.

Parameters path (string) – Name of the file/path with LAMMPS commands

command(cmd)
Process a single LAMMPS input command from a string.
This is a wrapper around the lammps_command() function of the C-library interface.

Parameters cmd (string) – a single lammps command

commands_list(cmdlist)
Process multiple LAMMPS input commands from a list of strings.
This is a wrapper around the lammps_commands_list() function of the C-library interface.

Parameters cmdlist (list of strings) – a single lammps command

commands_string(multicmd)
Process a block of LAMMPS input commands from a string.
This is a wrapper around the lammps_commands_string() function of the C-library interface.

Parameters multicmd (string) – text block of lammps commands

get_natoms()
Get the total number of atoms in the LAMMPS instance.
Will be precise up to 53-bit signed integer due to the underlying lammps_get_natoms() function returning a double.

Returns number of atoms
Return type int

extract_box()
Extract simulation box parameters
This is a wrapper around the lammps_extract_box() function of the C-library interface. Unlike in the C function, the result is returned as a list.

Returns list of the extracted data: boxlo, boxhi, xy, yz, xz, periodicity, box_change
reset_box(boxlo, boxhi, xy, yz, xz)
Reset simulation box parameters

This is a wrapper around the lammps_reset_box() function of the C-library interface.

Parameters

- boxlo (list of 3 floating point numbers) – new lower box boundaries
- boxhi (list of 3 floating point numbers) – new upper box boundaries
- xy (float) – xy tilt factor
- yz (float) – yz tilt factor
- xz (float) – xz tilt factor

get_thermo(name)
Get current value of a thermo keyword

This is a wrapper around the lammps_get_thermo() function of the C-library interface.

Parameters

- name (string) – name of thermo keyword

Returns

value of thermo keyword

Return type

double or None

extract_setting(name)
Query LAMMPS about global settings that can be expressed as an integer.

This is a wrapper around the lammps_extract_setting() function of the C-library interface. Its documentation includes a list of the supported keywords.

Parameters

- name (string) – name of the setting

Returns

value of the setting

Return type

int

extract_global_datatype(name)
Retrieve global property datatype from LAMMPS

This is a wrapper around the lammps_extract_global_datatype() function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns None if the keyword is not recognized. Otherwise it will return a positive integer value that corresponds to one of the constants define in the lammps module: LAMMPS_INT, LAMMPS_INT_2D, LAMMPS_DOUBLE, LAMMPS_DOUBLE_2D, LAMMPS_INT64, LAMMPS_INT64_2D, and LAMMPS_STRING. These values are equivalent to the ones defined in _LMP_DATATYPE_CONST.

Parameters

- name (string) – name of the property

Returns

datatype of global property

Return type

int

extract_global(name, dtype=None)
Query LAMMPS about global settings of different types.

This is a wrapper around the lammps_extract_global() function of the C-library interface. Unlike the C function this method returns the value and not a pointer and thus can only return the first value for keywords representing a list of values. The lammps_extract_global() documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library.
You can also force a specific data type. For that purpose the `lammps` module contains the constants `LAMMPS_INT`, `LAMMPS_DOUBLE`, `LAMMPS_INT64`, and `LAMMPS_STRING`. These values are equivalent to the ones defined in `_LMP_DATATYPE_CONST`. This function returns `None` if either the keyword is not recognized, or an invalid data type constant is used.

**Parameters**

- `name (string)` – name of the property
- `dtype (int, optional)` – data type of the returned data (see Data Types)

**Returns** value of the property or `None`

**Return type** `int`, `float`, or `NoneType`

`extract_atom_datatype(name)` Retrieve per-atom property datatype from LAMMPS

This is a wrapper around the `lammps_extract_atom_datatype()` function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns `None` if the keyword is not recognized. Otherwise it will return an integer value that corresponds to one of the constants define in the `lammps` module: `LAMMPS_INT`, `LAMMPS_INT_2D`, `LAMMPS_DOUBLE`, `LAMMPS_DOUBLE_2D`, `LAMMPS_INT64`, `LAMMPS_INT64_2D`, and `LAMMPS_STRING`. These values are equivalent to the ones defined in `_LMP_DATATYPE_CONST`.

**Parameters** `name (string)` – name of the property

**Returns** data type of per-atom property (see Data Types)

**Return type** `int`

`extract_atom(name, dtype=None)` Retrieve per-atom properties from LAMMPS

This is a wrapper around the `lammps_extract_atom()` function of the C-library interface. Its documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library. You can also force a specific data type. For that purpose the `lammps` module contains the constants `LAMMPS_INT`, `LAMMPS_INT_2D`, `LAMMPS_DOUBLE`, `LAMMPS_DOUBLE_2D`, `LAMMPS_INT64`, `LAMMPS_INT64_2D`, and `LAMMPS_STRING`. These values are equivalent to the ones defined in `_LMP_DATATYPE_CONST`. This function returns `None` if either the keyword is not recognized, or an invalid data type constant is used.

**Parameters**

- `name (string)` – name of the property
- `dtype (int, optional)` – data type of the returned data (see Data Types)

**Returns** requested data or `None`

**Return type** `ctypes.POINTER(ctypes.c_int32)`, `ctypes.POINTER(ctypes.POINTER(ctypes.c_int32))`, `ctypes.POINTER(ctypes.c_int64)`, `ctypes.POINTER(ctypes.POINTER(ctypes.c_int64))`, `ctypes.POINTER(ctypes.c_double)`, `ctypes.POINTER(ctypes.POINTER(ctypes.c_double))`, or `NoneType`

---

**Note:** While the returned arrays of per-atom data are dimensioned for the range \([0:nmax]\) - as is the underlying storage - the data is usually only valid for the range \([0:nlocal]\), unless the property of interest is also updated for ghost atoms. In some cases, this depends on a LAMMPS setting, see for example `comm_modify vel yes`. 

---

14.2. LAMMPS Python APIs 449
extract_compute \((id, \text{style}, \text{type})\)
Retrieve data from a LAMMPS compute

This is a wrapper around the `lammps_extract_compute()` function of the C-library interface. This function returns `None` if either the compute id is not recognized, or an invalid combination of `style` and `type` constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, otherwise a pointer.

**Parameters**
- `id` *(string)* – compute ID
- `style` *(int)* – style of the data retrieve (global, atom, or local)
- `type` *(int)* – type or size of the returned data (scalar, vector, or array)

**Returns** requested data

**Return type** integer or double or pointer to 1d or 2d double array or None

extract_fix \((id, \text{style}, \text{type}, nrow=0, ncol=0)\)
Retrieve data from a LAMMPS fix

This is a wrapper around the `lammps_extract_fix()` function of the C-library interface. This function returns `None` if either the fix id is not recognized, or an invalid combination of `style` and `type` constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, also when accessing global vectors or arrays, otherwise a pointer.

**Parameters**
- `id` *(string)* – fix ID
- `style` *(int)* – style of the data retrieve (global, atom, or local)
- `type` *(int)* – type or size of the returned data (scalar, vector, or array)
- `nrow` *(int)* – index of global vector element or row index of global array element
- `ncol` *(int)* – column index of global array element

**Returns** requested data

**Return type** integer or double value, pointer to 1d or 2d double array or None

extract_variable \((name, group=None, type=0)\)
Evaluate a LAMMPS variable and return its data

This function is a wrapper around the function `lammps_extract_variable()` of the C-library interface, evaluates variable name and returns a copy of the computed data. The memory temporarily allocated by the C-interface is deleted after the data is copied to a python variable or list. The variable must be either an equal-style (or equivalent) variable or an atom-style variable. The variable type has to provided as type parameter which may be two constants: `LMP_VAR_EQUAL` or `LMP_VAR_STRING`; it defaults to equal-style variables. The group parameter is only used for atom-style variables and defaults to the group “all” if set to `None`, which is the default.

**Parameters**
- `name` *(string)* – name of the variable to execute
- `group` *(string)* – name of group for atom style variable
- `type` *(int)* – type of variable

**Returns** the requested data
Return type: double, array of doubles, or None

**set_variable**(name, value)

Set a new value for a LAMMPS string style variable

This is a wrapper around the `lammps_set_variable()` function of the C-library interface.

Parameters:
- *name* (string) - name of the variable
- *value* (any. will be converted to a string) - new variable value

Returns: either 0 on success or -1 on failure

Return type: int

**encode_image_flags**(ix, iy, iz)

Convert 3 integers with image flags for x-, y-, and z-direction into a single integer like it is used internally in LAMMPS

This method is a wrapper around the `lammps_encode_image_flags()` function of library interface.

Parameters:
- *ix* (int) - x-direction image flag
- *iy* (int) - y-direction image flag
- *iz* (int) - z-direction image flag

Returns: encoded image flags

Return type: lammps.c_imageint

**decode_image_flags**(image)

Convert encoded image flag integer into list of three regular integers.

This method is a wrapper around the `lammps_decode_image_flags()` function of library interface.

Parameters: image (lammps.c_imageint) - encoded image flags

Returns: list of three image flags in x-, y-, and z- direction

Return type: list of 3 int

**create_atoms**(n, id, type, x, v=None, image=None, shrinkexceed=False)

Create N atoms from list of coordinates and properties

This function is a wrapper around the `lammps_create_atoms()` function of the C-library interface, and the behavior is similar except that the v, image, and shrinkexceed arguments are optional and default to None, None, and False, respectively. With none being equivalent to a NULL pointer in C.

The lists of coordinates, types, atom IDs, velocities, image flags can be provided in any format that may be converted into the required internal data types. Also the list may contain more than N entries, but not fewer. In the latter case, the function will return without attempting to create atoms. You may use the `encode_image_flags` method to properly combine three integers with image flags into a single integer.

Parameters:
- *n* (int) - number of atoms for which data is provided
- *id* (list of lammps.tagint) - list of atom IDs with at least n elements or None
- *type* (list of int) - list of atom types
- *x* (list of float) - list of coordinates for x-, y-, and z (flat list of 3n entries)
• \( \mathbf{v} \) (list of float) – list of velocities for x-, y-, and z (flat list of 3n entries) or None (optional)

• \texttt{image} (list of \texttt{lammps.imageint}) – list of encoded image flags (optional)

• \texttt{shrinkexceed} (bool) – whether to expand shrink-wrap boundaries if atoms are outside the box (optional)

\textbf{Returns} number of atoms created. 0 if insufficient or invalid data

\textbf{Return type} int

\textbf{property has_mpi_support}

Report whether the LAMMPS shared library was compiled with a real MPI library or in serial.

This is a wrapper around the \texttt{lammps_config_has_mpi_support()} function of the library interface.

\textbf{Returns} False when compiled with MPI STUBS, otherwise True

\textbf{Return type} bool

\textbf{property has_exceptions}

Report whether the LAMMPS shared library was compiled with C++ exceptions handling enabled

This is a wrapper around the \texttt{lammps_config_has_exceptions()} function of the library interface.

\textbf{Returns} state of C++ exception support

\textbf{Return type} bool

\textbf{property has_gzip_support}

Report whether the LAMMPS shared library was compiled with support for reading and writing compressed files through \texttt{gzip}.

This is a wrapper around the \texttt{lammps_config_has_gzip_support()} function of the library interface.

\textbf{Returns} state of gzip support

\textbf{Return type} bool

\textbf{property has_png_support}

Report whether the LAMMPS shared library was compiled with support for writing images in PNG format.

This is a wrapper around the \texttt{lammps_config_has_png_support()} function of the library interface.

\textbf{Returns} state of PNG support

\textbf{Return type} bool

\textbf{property has_jpeg_support}

Report whether the LAMMPS shared library was compiled with support for writing images in JPEG format.

This is a wrapper around the \texttt{lammps_config_has_jpeg_support()} function of the library interface.

\textbf{Returns} state of JPEG support

\textbf{Return type} bool

\textbf{property has_ffmpeg_support}

State of support for writing movies with \texttt{ffmpeg} in the LAMMPS shared library
This is a wrapper around the `lammps_config_has_ffmpeg_support()` function of the library interface.

**Returns** state of ffmpeg support

**Return type** bool

### property installed_packages

List of the names of enabled packages in the LAMMPS shared library

This is a wrapper around the functions `lammps_config_package_count()` and `lammps_config_package_name` of the library interface.

**has_style** *(category, name)*

Returns whether a given style name is available in a given category

This is a wrapper around the function `lammps_has_style()` of the library interface.

**Parameters**

- **category** *(string)* – name of category
- **name** *(string)* – name of the style

**Returns** true if style is available in given category

**Return type** bool

### available_styles**(category)**

Returns a list of styles available for a given category

This is a wrapper around the functions `lammps_style_count()` and `lammps_style_name()` of the library interface.

**Parameters** **category** *(string)* – name of category

**Returns** list of style names in given category

**Return type** list

### get_neighlist**(idx)**

Returns an instance of `NeighList` which wraps access to the neighbor list with the given index

**Parameters** **idx** *(int)* – index of neighbor list

**Returns** an instance of `NeighList` wrapping access to neighbor list data

**Return type** `NeighList`

### find_pair_neighlist**(style, exact=True, nsub=0, request=0)**

Find neighbor list index of pair style neighbor list

Try finding pair instance that matches style. If exact is set, the pair must match style exactly. If exact is 0, style must only be contained. If pair is of style pair/hybrid, style is instead matched the nsub-th hybrid sub-style.

Once the pair instance has been identified, multiple neighbor list requests may be found. Every neighbor list is uniquely identified by its request index. Thus, providing this request index ensures that the correct neighbor list index is returned.

**Parameters**

- **style** *(string)* – name of pair style that should be searched for
• `exact(bool, optional)` – controls whether style should match exactly or only must be contained in pair style name, defaults to True

• `nsub(int, optional)` – match nsub-th hybrid sub-style, defaults to 0

• `request(int, optional)` – index of neighbor list request, in case there are more than one, defaults to 0

**Returns** neighbor list index if found, otherwise -1

**Return type** int

`find_fix_neighlist(fixid, request=0)`
Find neighbor list index of fix neighbor list

**Parameters**

• `fixid(string)` – name of fix

• `request(int, optional)` – index of neighbor list request, in case there are more than one, defaults to 0

**Returns** neighbor list index if found, otherwise -1

**Return type** int

`find_compute_neighlist(computeid, request=0)`
Find neighbor list index of compute neighbor list

**Parameters**

• `computeid(string)` – name of compute

• `request(int, optional)` – index of neighbor list request, in case there are more than one, defaults to 0

**Returns** neighbor list index if found, otherwise -1

**Return type** int

`get_neighlist_size(idx)`
Return the number of elements in neighbor list with the given index

**Parameters** `idx(int)` – neighbor list index

**Returns** number of elements in neighbor list with index idx

**Return type** int

`get_neighlist_element_neighbors(idx, element)`
Return data of neighbor list entry

**Parameters**

• `element(int)` – neighbor list index

• `element` – neighbor list element index

**Returns** tuple with atom local index, number of neighbors and array of neighbor local atom indices

**Return type** (int, int, numpy.array)
14.2.6 The PyLammps class API

The PyLammps class is a wrapper that creates a simpler, more “Pythonic” interface to common LAMMPS functionality. LAMMPS data structures are exposed through objects and properties. This makes Python scripts shorter and more concise. See the PyLammps Tutorial for an introduction on how to use this interface.

```python
class lammmps.PyLammps(name='', cmdargs=None, ptr=None, comm=None)
```

This is a Python wrapper class around the lower-level lammmps class, exposing a more Python-like, object-oriented interface for prototyping system inside of IPython and Jupyter notebooks.

It either creates its own instance of lammmps or can be initialized with an existing instance. The arguments are the same of the lower-level interface. The original interface can still be accessed via PyLammps.lmp.

**Parameters**

- `name` *(string)* – “machine” name of the shared LAMMPS library (“mpi” loads liblammps_mpi.so, “” loads liblammps.so)
- `cmdargs` *(list)* – list of command line arguments to be passed to the `lammps_open()` function. The executable name is automatically added.
- `ptr` *(pointer)* – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
- `comm` *(MPI_Comm)* – MPI communicator (as provided by mpi4py). None means use MPI_COMM_WORLD implicitly.

**Variables**

- `lmp` *(lammmps)* – instance of original LAMMPS Python interface
- `runs` – list of completed runs, each storing the thermo output

```python
close()
```

Explicitly delete a LAMMPS instance

This is a wrapper around the `lammmps.close()` of the Python interface.

```python
version()
```

Return a numerical representation of the LAMMPS version in use.

This is a wrapper around the `lammmps.version()` function of the Python interface.

- **Returns** version number
- **Return type** int

```python
file(file)
```

Read LAMMPS commands from a file.

This is a wrapper around the `lammmps.file()` function of the Python interface.

- **Parameters** `path` *(string)* – Name of the file/path with LAMMPS commands

```python
write_script(filepath)
```

Write LAMMPS script file containing all commands executed up until now

- **Parameters** `filepath` *(string)* – path to script file that should be written

```python
command(cmd)
```

Execute LAMMPS command

All commands executed will be stored in a command history which can be written to a file using `PyLammps.write_script()`

- **Parameters** `cmd` – command string that should be executed
Type cmd: string

run(*args, **kwargs)
Execute LAMMPS run command with given arguments

All thermo output during the run is captured and saved as new entry in PyLammps.runs. The latest run can be retrieved by PyLammps.last_run.

property last_run
Return data produced of last completed run command

  Getter  Returns an object containing information about the last run command
  Type    dict

property atoms
All atoms of this LAMMPS instance

  Getter  Returns a list of atoms currently in the system
  Type    AtomList

property system
The system state of this LAMMPS instance

  Getter  Returns an object with properties storing the current system state
  Type    namedtuple

property communication
The communication state of this LAMMPS instance

  Getter  Returns an object with properties storing the current communication state
  Type    namedtuple

property computes
The list of active computes of this LAMMPS instance

  Getter  Returns a list of computes that are currently active in this LAMMPS instance
  Type    list

property dumps
The list of active dumps of this LAMMPS instance

  Getter  Returns a list of dumps that are currently active in this LAMMPS instance
  Type    list

property fixes
The list of active fixes of this LAMMPS instance

  Getter  Returns a list of fixes that are currently active in this LAMMPS instance
  Type    list

property groups
The list of active atom groups of this LAMMPS instance

  Getter  Returns a list of atom groups that are currently active in this LAMMPS instance
  Type    list

property variables
Returns a dictionary of all variables defined in the current LAMMPS instance

  Getter  Returns a dictionary of all variables that are defined in this LAMMPS instance
Type dict

eval(expr)
Evaluate expression

Parameters expr (string) – the expression string that should be evaluated inside of
LAMMPS

Returns the value of the evaluated expression

Return type float if numeric, string otherwise

lmp_print(s)
needed for Python2 compatibility, since print is a reserved keyword

class lammps.AtomList(pylammps_instance)
A dynamic list of atoms that returns either an Atom or Atom2D instance for each atom. Instances are only
allocated when accessed.

Variables

• natoms – total number of atoms
• dimensions – number of dimensions in system

class lammps.Atom(pylammps_instance, index)
A wrapper class then represents a single atom inside of LAMMPS

It provides access to properties of the atom and allows you to change some of them.

class lammps.Atom2D(pylammps_instance, index)
A wrapper class then represents a single 2D atom inside of LAMMPS

It provides access to properties of the atom and allows you to change some of them.

14.2.7 The IPyLammps class API

The IPyLammps class is an extension of PyLammps, adding additional functions to quickly display visualizations
such as images and videos inside of IPython. See the PyLammps Tutorial for examples.

class lammps.IPyLammps(name='', cmdargs=None, ptr=None, comm=None)
IPython wrapper for LAMMPS which adds embedded graphics capabilities to PyLammmps interface

It either creates its own instance of lammps or can be initialized with an existing instance. The arguments are
the same of the lower-level interface. The original interface can still be accessed via PyLammps.lmp.

Parameters

• name (string) – “machine” name of the shared LAMMPS library (“mpi” loads
liblammps_mpi.so,”” loads liblammps.so)
• cmdargs (list) – list of command line arguments to be passed to the lammps_open() function. The executable name is automatically added.
• ptr (pointer) – pointer to a LAMMPS C++ class instance when called from an embed-
ed Python interpreter. None means load symbols from shared library.
• comm (MPI_Comm) – MPI communicator (as provided by mpi4py). None means use
MPI_COMM_WORLD implicitly.
Generate image using write_dump command and display it

See dump image for more information.

Parameters

- **filename** (string) – Name of the image file that should be generated. The extension determines whether it is PNG or JPEG
- **group** (string) – the group of atoms write_image should use
- **color** (string) – name of property used to determine color
- **diameter** (string) – name of property used to determine atom diameter
- **size** (tuple (width, height)) – dimensions of image
- **view** (tuple (theta, phi)) – view parameters
- **center** (tuple (flag, center_x, center_y, center_z)) – center parameters
- **up** (tuple (up_x, up_y, up_z)) – vector pointing to up direction
- **zoom** (float) – zoom factor
- **background_color** (string) – background color of scene

Returns Image instance used to display image in notebook

Return type IPython.core.display.Image

**video**(filename)

Load video from file

Can be used to visualize videos from dump movie.

Parameters **filename** (string) – Path to video file

Returns HTML Video Tag used by notebook to embed a video

Return type IPython.display.HTML

### 14.2.8 Additional components of the lammps module

The lammps module additionally contains several constants and the NeighList class:

**Data Types**

LAMMPS_INT, LAMMPS_INT_2D, LAMMPS_DOUBLE, LAMMPS_DOUBLE_2D, LAMMPS_INT64, LAMMPS_INT64_2D,

Constants in the lammps module to indicate how to cast data when the C library function returns a void pointer. Used in lammps.extract_global() and lammps.extract_atom(). See _LMP_DATATYPE_CONST for the equivalent constants in the C library interface.
Style Constants

LMP_STYLE_GLOBAL, LMP_STYLE_ATOM, LMP_STYLE_LOCAL

Constants in the lammps module to select what style of data to request from computes or fixes. See _LMP_STYLE_CONST for the equivalent constants in the C library interface. Used in lammps.extract_compute() and lammps.extract_fix().

Type Constants

LMP_TYPE_SCALAR, LMP_TYLE_VECTOR, LMP_TYPE_ARRAY, LMP_SIZE_VECTOR, LMP_SIZE_ROWS, LMP_SIZE_COLS

Constants in the lammps module to select what type of data to request from computes or fixes. See _LMP_TYPE_CONST for the equivalent constants in the C library interface. Used in lammps.extract_compute() and lammps.extract_fix().

Variable Style Constants

LMP_VAR_EQUAL, LMP_VAR_ATOM

Constants in the lammps module to select what style of variable to query when calling lammps.extract_variable().

Classes representing internal objects

class lammps.NeighList(lmp, idx)

This is a wrapper class that exposes the contents of a neighbor list. It can be used like a regular Python list. Internally it uses the lower-level LAMMPS C-library interface.

Parameters

• lmp (lammps) – reference to instance of lammps
• idx (int) – neighbor list index

property size

Returns number of elements in neighbor list

get(element)

Returns tuple with atom local index, number of neighbors and array of neighbor local atom indices

Return type (int, int, numpy.array)

14.2.9 LAMMPS error handling in Python

Compiling the shared library with C++ exception support provides a better error handling experience. Without exceptions the LAMMPS code will terminate the current Python process with an error message. C++ exceptions allow capturing them on the C++ side and rethrowing them on the Python side. This way LAMMPS errors can be handled through the Python exception handling mechanism.
14.3 LAMMPS Fortran API

The LAMMPS Fortran module is a wrapper around calling functions from the LAMMPS C library API from Fortran through the ISO_C_BINDING feature in Fortran 2003. The interface is object oriented but otherwise trying to be very similar to the C library API and the basic Python module.

14.3.1 The LIBLAMMPS Fortran Module

The LIBLAMMPS module provides an interface to call LAMMPS from a Fortran code. It is based on the LAMMPS C-library interface and requires a Fortran 2003 compatible compiler to be compiled.

While C libraries have a defined binary interface (ABI) and can thus be used from multiple compiler versions from different vendors for as long as they are compatible with the hosting operating system, the same is not true for Fortran codes. Thus the LAMMPS Fortran module needs to be compiled alongside the code using it from the source code in fortran/lammps.f90. When linking, you also need to link to the LAMMPS library. A typical command line for a simple program using the Fortran interface would be:

```
mpifort -o testlib.x lammps.f90 testlib.f90 -L. -llammps
```

Please note, that the MPI compiler wrapper is only required when the calling the library from an MPI parallel code. Please also note the order of the source files: the lammps.f90 file needs to be compiled first, since it provides the LIBLAMMPS module that is imported by the Fortran code using the interface.

Work in Progress

This Fortran module is work in progress and only the documented functionality is currently available. The final implementation should cover the entire range of functionality available in the C and Python library interfaces.

14.3.2 Creating or deleting a LAMMPS object

With the Fortran interface the creation of a LAMMPS instance is included in the constructor for creating the lammps() derived type. To import the definition of that type and its type bound procedures you need to add a USE LIBLAMMPS statement. Internally it will call either lammps_open_fortran() or lammps_open_no_mpi() from the C library API to create the class instance. All arguments are optional and lammps_mpi_init() will be called automatically, if it is needed. Similarly, a possible call to lammps_finalize() is integrated into the close() function and triggered with the optional logical argument set to .true.. Here is a simple example:
PROGRAM testlib
USE LIBLAMMPS : : lmp
! include the LAMMPS library interface
TYPE(lammps) :: lmp : : lmp
! derived type to hold LAMMPS instance
CHARACTER(len=+), DIMENSION(+), PARAMETER :: args = &
   [ CHARACTER(len=+2) :: 'liblammps', '-log', 'none' ]

! create a LAMMPS instance (and initialize MPI)
lmp = lammps(args)
! get and print numerical version code
PRINT*, 'LAMMPS Version: ', lmp%version()
! delete LAMMPS instance (and shuts down MPI)
CALL lmp%close(.true.)
END PROGRAM testlib

Executing LAMMPS commands

Once a LAMMPS instance is created, it is possible to “drive” the LAMMPS simulation by telling LAMMPS to read commands from a file, or pass individual or multiple commands from strings or lists of strings. This is done similar to how it is implemented in the C-library <pg_lib_execute> interface. Before handing off the calls to the C-library interface, the corresponding Fortran versions of the calls (file(), command(), commands_list(), and commands_string()) have to make a copy of the strings passed as arguments so that they can be modified to be compatible with the requirements of strings in C without affecting the original strings. Those copies are automatically deleted after the functions return. Below is a small demonstration of the uses of the different functions:

PROGRAM testcmd
USE LIBLAMMPS
TYPE(lammps) :: lmp
CHARACTER(len=512) :: cmds
CHARACTER(len=40), ALLOCATABLE :: cmdlist(:)
CHARACTER(len=10) :: trimmed
INTEGER :: i

lmp = lammps()
CALL lmp%file('in.melt')
CALL lmp%command('variable zpos index 1.0')
! define 10 groups of 10 atoms each
ALLOCATE(cmdlist(10))
DO i=1,10
   WRITE(trimmed,'(I10)') 10*i
   WRITE(cmdlist(i),'(A,I1,A,I10,A,A)') &
      'group g',i-1,' id ',10*(i-1)+1,':',ADJUSTL(trimmed)
END DO
CALL lmp%commands_list(cmdlist)
! run multiple commands from multi-line string
cmds = 'clear' // NEW_LINE('A') // &
   'region box block 0 2 0 2 0 2' // NEW_LINE('A') // &
   'create_box 1 box' // NEW_LINE('A') // &
   'create_atoms 1 single 1.0 1.0 ${zpos}'
CALL lmp%commands_string(cmds)
CALL lmp%close()
END PROGRAM testcmd
### 14.3.3 The LIBLAMMPS module API

Below are the detailed descriptions of definitions and interfaces of the contents of the LIBLAMMPS Fortran interface to LAMMPS.

**type lammps**

Derived type that is the general class of the Fortran interface. It holds a reference to the LAMMPS class instance that any of the included calls are forwarded to.

**Type fields**

- % handle [c_ptr] :: reference to the LAMMPS class
- % close :: close()
- % version :: version()
- % file :: file()
- % command :: command()
- % commands_list :: commands_list()
- % commands_string :: commands_string()

**function lammps (args[, comm])**

This is the constructor for the Fortran class and will forward the arguments to a call to either lammps_open_fortran() or lammps_open_no_mpi(). If the LAMMPS library has been compiled with MPI support, it will also initialize MPI, if it has not already been initialized before.

The args argument with the list of command line parameters is optional and so it the comm argument with the MPI communicator. If comm is not provided, MPI_COMM_WORLD is assumed. For more details please see the documentation of lammps_open().

**Parameters**

- args (*)[character(len=*),optional] :: arguments as list of strings
- comm [integer,optional] :: MPI communicator

**Return** lammps :: an instance of the lammps derived type

**subroutine close ([finalize])**

This method will close down the LAMMPS instance through calling lammps_close(). If the finalize argument is present and has a value of .true., then this subroutine also calls lammps_mpi_finalize().

**Options**

- finalize [logical,optional] :: shut down the MPI environment of the LAMMPS library if true.

**function version ()**

This method returns the numeric LAMMPS version like lammps_version().

**Return** integer :: LAMMPS version

**subroutine file (filename)**

This method will call lammps_file() to have LAMMPS read and process commands from a file.

**Parameters**

- filename [character(len=*)] :: name of file with LAMMPS commands

**subroutine command (cmd)**

This method will call lammps_command() to have LAMMPS execute a single command.

**Parameters**

- cmd [character(len=*)] :: single LAMMPS command

**subroutine commands_list (cmds)**

This method will call lammps_commands_list() to have LAMMPS execute a list of input lines.
**Parameters cmd \([\text{character(len=*)]}\) :: list of LAMMPS input lines**

**subroutine commands_string**(str)

This method will call `lammps_commands_string()` to have LAMMPS execute a block of commands from a string.

**Parameters str \([\text{character(len=*)]}\) :: LAMMPS input in string**

---

### 14.4 LAMMPS C++ API

It is also possible to invoke the LAMMPS C++ API directly in your code. It is lacking some of the convenience of the C library API, but it allows a more direct access to simulation data and thus more low-level manipulations. The following links provide some examples and references to the C++ API.

#### 14.4.1 Using the C++ API directly

Using the C++ classes of the LAMMPS library is lacking some of the convenience of the C library API, but it allows a more direct access to simulation data and thus more low-level manipulations and tighter integration of LAMMPS into another code. While for the complete C library API is provided in the `library.h` header file, for using the C++ API it is required to include the individual header files defining the individual classes in use. Typically the name of the class and the name of the header follow some simple rule. Examples are given below.

#### 14.4.2 Creating or deleting a LAMMPS object

When using the LAMMPS library interfaces, the core task is to create an instance of the `LAMMPS_NS::LAMMPS` class. In C++ this can be done directly through the `new` operator. All further operations are then initiated through calling member functions of some of the components of the LAMMPS class or accessing their data members. The destruction of the LAMMPS instance is correspondingly initiated by using the `delete` operator. Here is a simple example:

```cpp
#include "lammps.h"
#include "universe.h"

#include <mpi.h>
#include <iostream>

int main(int argc, char **argv)
{
    LAMMPS_NS::LAMMPS *lmp;
    // custom argument vector for LAMMPS library
    const char *lmpargv[] = {"liblammps", ":log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    // explicitly initialize MPI
    MPI_Init(&argc, &argv);

    // create LAMMPS instance
    lmp = new LAMMPS_NS::LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
    // output numerical version string
    std::cout << "LAMMPS version: " << lmp->universe->num_ver << std::endl;

    // delete LAMMPS instance
    delete lmp;
}
```

(continues on next page)
Please note that this requires to include the `lammps.h` header for accessing the members of the LAMMPS class and then the `universe.h` header for accessing the `num_ver` member of the Universe class.

### 14.4.3 Executing LAMMPS commands

Once a LAMMPS instance is created by your C++ code, you need to set up a simulation and that is most conveniently done by “driving” it through issuing commands like you would do when running a LAMMPS simulation from an input script. Processing of input in LAMMPS is handled by the `Input` class an instance of which is a member of the `LAMMPS` class. You have two options: reading commands from a file, or executing a single command from a string. See below for a small example:

```cpp
#include "lammps.h"
#include "input.h"
#include <mpi.h>

using namespace LAMMPS_NS;

int main(int argc, char **argv) {
    const char *lmpargv[] {"liblammps", ",log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    MPI_Init(&argc, &argv);
    LAMMPS *lmp = new LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
    lmp->input->file("in.melt");
    lmp->input->one("run 100 post no");
    delete lmp;
    return 0;
}
```
LAMMPS is designed in a modular fashion so as to be easy to modify and extend with new functionality. In fact, about 95% of its source code is add-on files. These doc pages give basic instructions on how to do this.

If you add a new feature to LAMMPS and think it will be of interest to general users, we encourage you to submit it for inclusion in LAMMPS as a pull request on our GitHub site, after reading this page.

15.1 Overview

The best way to add a new feature to LAMMPS is to find a similar feature and look at the corresponding source and header files to figure out what it does. You will need some knowledge of C++ to be able to understand the high-level structure of LAMMPS and its class organization, but functions (class methods) that do actual computations are written in vanilla C-style code and operate on simple C-style data structures (vectors and arrays).

Most of the new features described on the Modify doc page require you to write a new C++ derived class (except for exceptions described below, where you can make small edits to existing files). Creating a new class requires 2 files, a source code file (*.cpp) and a header file (*.h). The derived class must provide certain methods to work as a new option. Depending on how different your new feature is compared to existing features, you can either derive from the base class itself, or from a derived class that already exists. Enabling LAMMPS to invoke the new class is as simple as putting the two source files in the src directory and re-building LAMMPS.

The advantage of C++ and its object-orientation is that all the code and variables needed to define the new feature are in the 2 files you write, and thus should not make the rest of LAMMPS more complex or cause side-effect bugs.

Here is a concrete example. Suppose you write 2 files pair_foo.cpp and pair_foo.h that define a new class PairFoo that computes pairwise potentials described in the classic 1997 paper by Foo, et al. If you wish to invoke those potentials in a LAMMPS input script with a command like

```
pair_style foo 0.1 3.5
```

then your pair_foo.h file should be structured as follows:

```
#define PAIR_CLASS
PairStyle(foo,PairFoo)
#else
...
(class definition for PairFoo)
...
#endif
```

where “foo” is the style keyword in the pair_style command, and PairFoo is the class name defined in your pair_foo.cpp and pair_foo.h files.
When you re-build LAMMPS, your new pairwise potential becomes part of the executable and can be invoked with a pair_style command like the example above. Arguments like 0.1 and 3.5 can be defined and processed by your new class.

As illustrated by this example pair style, many kinds of options are referred to in the LAMMPS documentation as the “style” of a particular command.

The Modify page lists all the common styles in LAMMPS, and discusses the header file for the base class that these styles are derived from. Public variables in that file are ones used and set by the derived classes which are also used by the base class. Sometimes they are also used by the rest of LAMMPS. Pure functions, which means functions declared as virtual in the base class header file which are also set to 0, are functions you must implement in your new derived class to give it the functionality LAMMPS expects. Virtual functions that are not set to 0 are functions you may override or not. Those are usually defined with an empty function body.

Additionally, new output options can be added directly to the thermo.cpp, dump_custom.cpp, and variable.cpp files. These are also listed on the Modify page.

Here are additional guidelines for modifying LAMMPS and adding new functionality:

- Think about whether what you want to do would be better as a pre- or post-processing step. Many computations are more easily and more quickly done that way.
- Do not try to do anything within the timestepping of a run that is not parallel. For example do not accumulate a bunch of data on a single processor and analyze it. You run the risk of seriously degrading the parallel efficiency this way.
- If your new feature reads arguments or writes output, make sure you follow the unit conventions discussed by the units command.

(15.2) Submitting new features for inclusion in LAMMPS

We encourage users to submit new features or modifications for LAMMPS to the core developers so they can be added to the LAMMPS distribution. The preferred way to manage and coordinate this is via the LAMMPS project on GitHub. Please see the GitHub Tutorial for a demonstration on how to do that. An alternative is to contact the LAMMPS developers or the indicated developer of a package or feature directly and send in your contribution via e-mail, but that can add a significant delay on getting your contribution included, depending on how busy the developer is you contact, how complex a task it would be to integrate that code, and how many - if any - changes are required before the code can be included.

For any larger modifications or programming project, you are encouraged to contact the LAMMPS developers ahead of time, in order to discuss implementation strategies and coding guidelines, that will make it easier to integrate your contribution and result in less work for everybody involved. You are also encouraged to search through the list of open issues on GitHub and submit a new issue for a planned feature, so you would not duplicate the work of others (and possibly get scooped by them) or have your work duplicated by others.

For informal communication with (some of) the LAMMPS developers you may ask to join the LAMMPS developers on Slack. This slack work space is by invitation only. Thus for access, please send an e-mail to slack@lammps.org explaining what part of LAMMPS you are working on. Only discussions related to LAMMPS development are tolerated, so this is NOT for people that look for help with compiling, installing, or using LAMMPS. Please contact the lammps-users mailing list for those purposes instead.

How quickly your contribution will be integrated depends largely on how much effort it will cause to integrate and test it, how much it requires changes to the core codebase, and of how much interest it is to the larger LAMMPS community. Please see below for a checklist of typical requirements. Once you have prepared everything, see the
LAMMPS Documentation

For instructions on how to submit your changes or new files through a GitHub pull request. If you prefer to submit patches or full files, you should first make certain, that your code works correctly with the latest patch-level version of LAMMPS and contains all bug fixes from it. Then create a gzipped tar file of all changed or added files or a corresponding patch file using ‘diff -u’ or ‘diff -c’ and compress it with gzip. Please only use gzip compression, as this works well on all platforms.

If the new features/files are broadly useful we may add them as core files to LAMMPS or as part of a standard package. Else we will add them as a user-contributed file or user package. Examples of user packages are in src sub-directories that start with USER. The USER-MISC package is simply a collection of (mostly) unrelated single files, which is the simplest way to have your contribution quickly added to the LAMMPS distribution. All the standard and user packages are listed and described on the Packages details doc page.

Note that by providing us files to release, you are agreeing to make them open-source, i.e. we can release them under the terms of the GPL, used as a license for the rest of LAMMPS. See the LAMMPS license doc page for details.

With user packages and files, all we are really providing (aside from the fame and fortune that accompanies having your name in the source code and on the Authors page of the LAMMPS WWW site), is a means for you to distribute your work to the LAMMPS user community, and a mechanism for others to easily try out your new feature. This may help you find bugs or make contact with new collaborators. Note that you’re also implicitly agreeing to support your code which means answer questions, fix bugs, and maintain it if LAMMPS changes in some way that breaks it (an unusual event).

Note: If you prefer to actively develop and support your add-on feature yourself, then you may wish to make it available for download from your own website, as a user package that LAMMPS users can add to their copy of LAMMPS. See the Offsite LAMMPS packages and tools page of the LAMMPS web site for examples of groups that do this. We are happy to advertise your package and web site from that page. Simply email the developers with info about your package and we will post it there.

The previous sections of this doc page describe how to add new “style” files of various kinds to LAMMPS. Packages are simply collections of one or more new class files which are invoked as a new style within a LAMMPS input script. If designed correctly, these additions typically do not require changes to the main core of LAMMPS; they are simply add-on files. If you think your new feature requires non-trivial changes in core LAMMPS files, you should communicate with the developers, since we may or may not want to include those changes for some reason. An example of a trivial change is making a parent-class method “virtual” when you derive a new child class from it.

Here is a checklist of steps you need to follow to submit a single file or user package for our consideration. Following these steps will save both you and us time. Please have a look at the existing files in packages in the src directory for examples. If you are uncertain, please ask.

• All source files you provide must compile with the most current version of LAMMPS with multiple configurations. In particular you need to test compiling LAMMPS from scratch with -DLAMMPS_BIGBIG set in addition to the default -DLAMMPS_SMALLBIG setting. Your code will need to work correctly in serial and in parallel using MPI.

• For consistency with the rest of LAMMPS and especially, if you want your contribution(s) to be added to main LAMMPS code or one of its standard packages, it needs to be written in a style compatible with other LAMMPS source files. This means: 2-character indentation per level, no tabs, no lines over 80 characters. I/O is done via the C-style stdio library (mixing of stdio and iostreams is generally discouraged), class header files should not import any system headers outside of <cstdlib>, STL containers should be avoided in headers, system header from the C library should use the C++-style names (<cstdlib>, <cstdio>, or <cstring>) instead of the C-style names <stdlib.h>, <stdio.h>, or <string.h>, and forward declarations used where possible or needed to avoid including headers. All added code should be placed into the LAMMPS_NS namespace or a sub-namespace; global or static variables should be avoided, as they conflict with the modular nature of LAMMPS and the C++ class structure. Header files must not import namespaces with using. This all is so the developers can more easily understand, integrate, and maintain your contribution and reduce conflicts with other parts of LAMMPS.

15.2. Submitting new features for inclusion in LAMMPS 467
This basically means that the code accesses data structures, performs its operations, and is formatted similar to other LAMMPS source files, including the use of the error class for error and warning messages.

- If you want your contribution to be added as a user-contributed feature, and it’s a single file (actually a *.cpp and *.h file) it can rapidly be added to the USER-MISC directory. Send us the one-line entry to add to the USER-MISC/README file in that dir, along with the 2 source files. You can do this multiple times if you wish to contribute several individual features.

- If you want your contribution to be added as a user-contribution and it is several related features, it is probably best to make it a user package directory with a name like USER-FOO. In addition to your new files, the directory should contain a README text file. The README should contain your name and contact information and a brief description of what your new package does. If your files depend on other LAMMPS style files also being installed (e.g. because your file is a derived class from the other LAMMPS class), then an Install.sh file is also needed to check for those dependencies. See other README and Install.sh files in other USER directories as examples. Send us a tarball of this USER-FOO directory.

- Your new source files need to have the LAMMPS copyright, GPL notice, and your name and email address at the top, like other user-contributed LAMMPS source files. They need to create a class that is inside the LAMMPS namespace. If the file is for one of the USER packages, including USER-MISC, then we are not as picky about the coding style (see above). I.e. the files do not need to be in the same stylistic format and syntax as other LAMMPS files, though that would be nice for developers as well as users who try to read your code.

- You must also create a documentation file for each new command or style you are adding to LAMMPS. For simplicity and convenience, the documentation of groups of closely related commands or styles may be combined into a single file. This will be one file for a single-file feature. For a package, it might be several files. These are text files with a .rst extension using the reStructuredText markup language, that are then converted to HTML and PDF using the Sphinx documentation generator tool. Running Sphinx with the included configuration requires Python 3.x. Configuration settings and custom extensions for this conversion are included in the source distribution, and missing python packages will be transparently downloaded into a virtual environment via pip. Thus, if your local system is missing required packages, you need access to the internet. The translation can be as simple as doing “make html pdf” in the doc folder. As appropriate, the text files can include inline mathematical expression or figures (see doc/JPG for examples). Additional PDF files with further details (see doc/PDF for examples) may also be included. The doc page should also include literature citations as appropriate; see the bottom of doc/fix_nh.rst for examples and the earlier part of the same file for how to format the cite itself. Citation labels must be unique across all .rst files. The “Restrictions” section of the doc page should indicate if your command is only available if LAMMPS is built with the appropriate USER-MISC or USER-FOO package. See other user package doc files for examples of how to do this. Please run at least “make html” and “make spelling” and carefully inspect and proofread the resulting HTML format doc page before submitting your code. Upon submission of a pull request, checks for error free completion of the HTML and PDF build will be performed and also a spell check, a check for correct anchors and labels, and a check for completeness of references all styles in their corresponding tables and lists is run. In case the spell check reports false positives they can be added to the file doc/utils/sphinx-config/false_positives.txt

- For a new package (or even a single command) you should include one or more example scripts demonstrating its use. These should run in no more than a couple minutes, even on a single processor, and not require large data files as input. See directories under examples/USER for examples of input scripts other users provided for their packages. These example inputs are also required for validating memory accesses and testing for memory leaks with valgrind

- If there is a paper of yours describing your feature (either the algorithm/science behind the feature itself, or its initial usage, or its implementation in LAMMPS), you can add the citation to the *.cpp source file. See src/USER-EFF/atom_vec_electron.cpp for an example. A LaTeX citation is stored in a variable at the top of the file and a single line of code that references the variable is added to the constructor of the class. Whenever a user invokes your feature from their input script, this will cause LAMMPS to output the citation to a log.cite file and prompt the user to examine the file. Note that you should only use this for a paper you or your group authored. E.g. adding a cite in the code for a paper by Nose and Hoover if you write a fix that implements their integrator is not the intended usage. That kind of citation should just be in the doc page you provide.
Finally, as a general rule-of-thumb, the more clear and self-explanatory you make your documentation and README files, and the easier you make it for people to get started, e.g. by providing example scripts, the more likely it is that users will try out your new feature.

15.3 Atom styles

Classes that define an atom style are derived from the AtomVec class and managed by the Atom class. The atom style determines what attributes are associated with an atom and communicated when it is a ghost atom or migrates to a new processor. A new atom style can be created if one of the existing atom styles does not define all the attributes you need to store and communicate with atoms.

Atom_vec_atomic.cpp is the simplest example of an atom style. Examining the code for others will make these instructions more clear.

Note that the atom style hybrid command can be used to define atoms or particles which have the union of properties of individual styles. Also the fix property/atom command can be used to add a single property (e.g. charge or a molecule ID) to a style that does not have it. It can also be used to add custom properties to an atom, with options to communicate them with ghost atoms or read them from a data file. Other LAMMPS commands can access these custom properties, as can new pair, fix, compute styles that are written to work with these properties. For example, the set command can be used to set the values of custom per-atom properties from an input script. All of these methods are less work than writing code for a new atom style.

If you follow these directions your new style will automatically work in tandem with others via the atom_style hybrid command.

The first step is to define a set of strings in the constructor of the new derived class. Each string will have zero or more space-separated variable names which are identical to those used in the atom.h header file for per-atom properties. Note that some represent per-atom vectors (q, molecule) while other are per-atom arrays (x,v). For all but the last 2 strings you do not need to specify any of (id,type,x,v,f). Those are included automatically as needed in the other strings.

| fields_grow | full list of properties which is allocated and stored |
| fields_copy | list of properties to copy atoms are rearranged on-processor |
| fields_comm | list of properties communicated to ghost atoms every step |
| fields_comm_vel | additional properties communicated if comm_modify vel is used |
| fields_reverse | list of properties summed from ghost atoms every step |
| fields_border | list of properties communicated with ghost atoms every reneighboring step |
| fields_border_vel | additional properties communicated if comm_modify vel is used |
| fields_exchange | list of properties communicated when an atom migrates to another processor |
| fields_restart | list of properties written/read to/from a restart file |
| fields_create | list of properties defined when an atom is created by create_atoms |
| fields_data_atom | list of properties (in order) in the Atoms section of a data file, as read by read_data |
| fields_data_vel | list of properties (in order) in the Velocities section of a data file, as read by read_data |

In these strings you can list variable names which LAMMPS already defines (in some other atom style), or you can create new variable names. You should not re-use a LAMMPS variable for something with different meaning in your atom style. If the meaning is related, but interpreted differently by your atom style, then using the same variable name means a user should not use your style and the other style together in a atom_style hybrid command. Because there will only be one value of the variable and different parts of LAMMPS will then likely use it differently. LAMMPS has no way of checking for this.

If you are defining new variable names then make them descriptive and unique to your new atom style. For example choosing “e” for energy is a bad choice; it is too generic. A better choice would be “e.foo”, where “foo” is specific to your style.
If any of the variable names in your new atom style do not exist in LAMMPS, you need to add them to the src/atom.h and atom.cpp files.

Search for the word “customize” or “customization” in these 2 files to see where to add your variable. Adding a flag to the 2nd customization section in atom.h is only necessary if your code (e.g. a pair style) needs to check that a per-atom property is defined. These flags should also be set in the constructor of the atom style child class.

In atom.cpp, aside from the constructor and destructor, there are 3 methods that a new variable name or flag needs to be added to.

In Atom::peratom_create() when using the add_peratom() method, a final length argument of 0 is for per-atom vectors, a length > 1 is for per-atom arrays. Note the use of an extra per-thread flag and the add_peratom_vary() method when last dimension of the array is variable-length.

Adding the variable name to Atom::extract() enable the per-atom data to be accessed through the LAMMPS library interface by a calling code, including from Python.

The constructor of the new atom style will also typically set a few flags which are defined at the top of atom_vec.h. If these are unclear, see how other atom styles use them.

The grow_pointers() method is also required to make a copy of peratom data pointers, as explained in the code.

There are a number of other optional methods which your atom style can implement. These are only needed if you need to do something out-of-the-ordinary which the default operation of the AtomVec parent class does not take care of. The best way to figure out why they are sometimes useful is to look at how other atom styles use them.

- process_args = use if the atom style has arguments
- init = called before each run
- force_clear = called before force computations each timestep

A few atom styles define “bonus” data associated with some or all of their particles, such as atom_style ellipsoid or tri. These methods work with that data:

- copy_bonus
- clear_bonus
- pack_comm_bonus
- unpack_comm_bonus
- pack_border_bonus
- unpack_border_bonus
- pack_exchange_bonus
- unpack_exchange_bonus
- size_restart_bonus
- pack_restart_bonus
- unpack_restart_bonus
- data_atom_bonus
- memory_usage_bonus

The atom_style body command can define a particle geometry with an arbitrary number of values. This method reads it from a data file:

- data_body
These methods are called before or after operations handled by the parent AtomVec class. They allow an atom style to do customized operations on the per-atom values. For example, `atom_style sphere` reads a diameter and density of each particle from a data file. But these need to be converted internally to a radius and mass. That operation is done in the `data_atom_post()` method.

- `pack_restart_pre`
- `pack_restart_post`
- `unpack_restart_init`
- `create_atom_post`
- `data_atom_post`
- `pack_data_pre`
- `pack_data_post`

These methods enable the `compute property/atom` command to access per-atom variables it does not already define as arguments, so that they can be written to a dump file or used by other LAMMPS commands.

- `property_atom`
- `pack_property_atom`

### 15.4 Pair styles

Classes that compute pairwise interactions are derived from the Pair class. In LAMMPS, pairwise calculation include many-body potentials such as EAM or Tersoff where particles interact without a static bond topology. New styles can be created to add new pair potentials to LAMMPS.

Pair_lj_cut.cpp is a simple example of a Pair class, though it includes some optional methods to enable its use with rRESPA.

Here is a brief description of the class methods in pair.h:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute</code></td>
<td>workhorse routine that computes pairwise interactions</td>
</tr>
<tr>
<td><code>settings</code></td>
<td>reads the input script line with arguments you define</td>
</tr>
<tr>
<td><code>coeff</code></td>
<td>set coefficients for one i,j type pair</td>
</tr>
<tr>
<td><code>init_one</code></td>
<td>perform initialization for one i,j type pair</td>
</tr>
<tr>
<td><code>init_style</code></td>
<td>initialization specific to this pair style</td>
</tr>
<tr>
<td><code>write &amp; read_restart</code></td>
<td>write/read i,j pair coeffs to restart files</td>
</tr>
<tr>
<td><code>write &amp; read_restart_settings</code></td>
<td>write/read global settings to restart files</td>
</tr>
<tr>
<td><code>single</code></td>
<td>force and energy of a single pairwise interaction between 2 atoms</td>
</tr>
<tr>
<td><code>compute_inner/middle/outer</code></td>
<td>versions of compute used by rRESPA</td>
</tr>
</tbody>
</table>

The inner/middle/outer routines are optional.
15.5 Bond, angle, dihedral, improper styles

Classes that compute molecular interactions are derived from the Bond, Angle, Dihedral, and Improper classes. New styles can be created to add new potentials to LAMMPS.

Bond_harmonic.cpp is the simplest example of a bond style. Ditto for the harmonic forms of the angle, dihedral, and improper style commands.

Here is a brief description of common methods you define in your new derived class. See bond.h, angle.h, dihedral.h, and improper.h for details and specific additional methods.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>init</td>
<td>check if all coefficients are set, calls init_style (optional)</td>
</tr>
<tr>
<td>init_style</td>
<td>check if style specific conditions are met (optional)</td>
</tr>
<tr>
<td>compute</td>
<td>compute the molecular interactions (required)</td>
</tr>
<tr>
<td>settings</td>
<td>apply global settings for all types (optional)</td>
</tr>
<tr>
<td>coeff</td>
<td>set coefficients for one type (required)</td>
</tr>
<tr>
<td>equilibrium_distance</td>
<td>length of bond, used by SHAKE (required, bond only)</td>
</tr>
<tr>
<td>equilibrium_angle</td>
<td>opening of angle, used by SHAKE (required, angle only)</td>
</tr>
<tr>
<td>write &amp; read_restart</td>
<td>writes/reads coeffs to restart files (required)</td>
</tr>
<tr>
<td>single</td>
<td>force and energy of a single bond or angle (required, bond or angle only)</td>
</tr>
<tr>
<td>memory_usage</td>
<td>tally memory allocated by the style (optional)</td>
</tr>
</tbody>
</table>

15.6 Compute styles

Classes that compute scalar and vector quantities like temperature and the pressure tensor, as well as classes that compute per-atom quantities like kinetic energy and the centro-symmetry parameter are derived from the Compute class. New styles can be created to add new calculations to LAMMPS.

Compute_temp.cpp is a simple example of computing a scalar temperature. Compute_ke_atom.cpp is a simple example of computing per-atom kinetic energy.

Here is a brief description of methods you define in your new derived class. See compute.h for details.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>init</td>
<td>perform one time setup (required)</td>
</tr>
<tr>
<td>init_list</td>
<td>neighbor list setup, if needed (optional)</td>
</tr>
<tr>
<td>compute_scalar</td>
<td>compute a scalar quantity (optional)</td>
</tr>
<tr>
<td>compute_vector</td>
<td>compute a vector of quantities (optional)</td>
</tr>
<tr>
<td>compute_peratom</td>
<td>compute one or more quantities per atom (optional)</td>
</tr>
<tr>
<td>compute_local</td>
<td>compute one or more quantities per processor (optional)</td>
</tr>
<tr>
<td>pack_comm</td>
<td>pack a buffer with items to communicate (optional)</td>
</tr>
<tr>
<td>unpack_comm</td>
<td>unpack the buffer (optional)</td>
</tr>
<tr>
<td>pack_reverse</td>
<td>pack a buffer with items to reverse communicate (optional)</td>
</tr>
<tr>
<td>unpack_reverse</td>
<td>unpack the buffer (optional)</td>
</tr>
<tr>
<td>remove_bias</td>
<td>remove velocity bias from one atom (optional)</td>
</tr>
<tr>
<td>remove_bias_all</td>
<td>remove velocity bias from all atoms in group (optional)</td>
</tr>
<tr>
<td>restore_bias</td>
<td>restore velocity bias for one atom after remove_bias (optional)</td>
</tr>
<tr>
<td>restore_bias_all</td>
<td>same as before, but for all atoms in group (optional)</td>
</tr>
<tr>
<td>pair_tally_callback</td>
<td>callback function for tally-style computes (optional).</td>
</tr>
<tr>
<td>memory_usage</td>
<td>tally memory usage (optional)</td>
</tr>
</tbody>
</table>

Tally-style computes are a special case, as their computation is done in two stages: the callback function is registered with the pair style and then called from the Pair::ev_tally() function, which is called for each pair after force and
energy has been computed for this pair. Then the tallied values are retrieved with the standard compute_scalar or compute_vector or compute_peratom methods. The USER-TALLY package provides examples_compute_tally.html for utilizing this mechanism.

15.7 Fix styles

In LAMMPS, a “fix” is any operation that is computed during timestepping that alters some property of the system. Essentially everything that happens during a simulation besides force computation, neighbor list construction, and output, is a “fix”. This includes time integration (update of coordinates and velocities), force constraints or boundary conditions (SHAKE or walls), and diagnostics (compute a diffusion coefficient). New styles can be created to add new options to LAMMPS.

Fix_setforce.cpp is a simple example of setting forces on atoms to prescribed values. There are dozens of fix options already in LAMMPS; choose one as a template that is similar to what you want to implement.

Here is a brief description of methods you can define in your new derived class. See fix.h for details.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setmask</td>
<td>determines when the fix is called during the timestep (required)</td>
</tr>
<tr>
<td>init</td>
<td>initialization before a run (optional)</td>
</tr>
<tr>
<td>setup_pre_exchange</td>
<td>called before atom exchange in setup (optional)</td>
</tr>
<tr>
<td>setup_pre_force</td>
<td>called before force computation in setup (optional)</td>
</tr>
<tr>
<td>setup</td>
<td>called immediately before the first timestep and after forces are computed (optional)</td>
</tr>
<tr>
<td>min_setup_pre_force</td>
<td>like setup_pre_force, but for minimizations instead of MD runs (optional)</td>
</tr>
<tr>
<td>min_setup</td>
<td>like setup, but for minimizations instead of MD runs (optional)</td>
</tr>
<tr>
<td>initial_integrate</td>
<td>called at very beginning of each timestep (optional)</td>
</tr>
<tr>
<td>pre_exchange</td>
<td>called before atom exchange on re-neighboring steps (optional)</td>
</tr>

</table>

Typically, only a small fraction of these methods are defined for a particular fix. Setmask is mandatory, as it determines when the fix will be invoked during the timestep. Fixes that perform time integration (nve, nvt, npt) implement initial_integrate() and final_integrate() to perform velocity Verlet updates. Fixes that constrain forces implement post_force().

Fixes that perform diagnostics typically implement end_of_step(). For an end_of_step fix, one of your fix arguments must be the variable “nevery” which is used to determine when to call the fix and you must set this variable in the constructor of your fix. By convention, this is the first argument the fix defines (after the ID, group-ID, style).

If the fix needs to store information for each atom that persists from timestep to timestep, it can manage that memory and migrate the info with the atoms as they move from processors to processor by implementing the grow_arrays, copy_arrays, pack_exchange, and unpack_exchange methods. Similarly, the pack_restart and unpack_restart methods can be implemented to store information about the fix in restart files. If you wish an integrator or force constraint fix to work with rRESPA (see the run_style command), the initial_integrate, post_force_integrate, and final_integrate_respa methods can be implemented. The thermo method enables a fix to contribute values to thermodynamic output, as printed quantities and/or to be summed to the potential energy of the system.

### 15.8 Input script command style

New commands can be added to LAMMPS input scripts by adding new classes that have a “command” method. For example, the create_atoms, read_data, velocity, and run commands are all implemented in this fashion. When such a command is encountered in the LAMMPS input script, LAMMPS simply creates a class with the corresponding name, invokes the “command” method of the class, and passes it the arguments from the input script. The command method can perform whatever operations it wishes on LAMMPS data structures.

The single method your new class must define is as follows:

<table>
<thead>
<tr>
<th>command</th>
<th>operations performed by the new command</th>
</tr>
</thead>
</table>

Of course, the new class can define other methods and variables as needed.
15.9 Dump styles

Classes that dump per-atom info to files are derived from the Dump class. To dump new quantities or in a new format, a new derived dump class can be added, but it is typically simpler to modify the DumpCustom class contained in the dump_custom.cpp file.

Dump_atom.cpp is a simple example of a derived dump class.

Here is a brief description of methods you define in your new derived class. See dump.h for details.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>write_header</td>
<td>write the header section of a snapshot of atoms</td>
</tr>
<tr>
<td>count</td>
<td>count the number of lines a processor will output</td>
</tr>
<tr>
<td>pack</td>
<td>pack a proc’s output data into a buffer</td>
</tr>
<tr>
<td>write_data</td>
<td>write a proc’s data to a file</td>
</tr>
</tbody>
</table>

See the `dump` command and its `custom` style for a list of keywords for atom information that can already be dumped by DumpCustom. It includes options to dump per-atom info from Compute classes, so adding a new derived Compute class is one way to calculate new quantities to dump.

Note that new keywords for atom properties are not typically added to the `dump custom` command. Instead they are added to the `compute property/atom` command.

15.10 Kspace styles

Classes that compute long-range Coulombic interactions via K-space representations (Ewald, PPPM) are derived from the KSpace class. New styles can be created to add new K-space options to LAMMPS.

Ewald.cpp is an example of computing K-space interactions.

Here is a brief description of methods you define in your new derived class. See kspace.h for details.

<table>
<thead>
<tr>
<th>Method</th>

<td>computation before the first timestep of a run</td>
</tr>
<tr>
<td>compute</td>
<td>every-timestep computation</td>
</tr>
<tr>
<td>memory_usage</td>
<td>tally of memory usage</td>
</tr>
</tbody>
</table>

15.11 Minimization styles

Classes that perform energy minimization derived from the Min class. New styles can be created to add new minimization algorithms to LAMMPS.

Min_cg.cpp is an example of conjugate gradient minimization.

Here is a brief description of methods you define in your new derived class. See min.h for details.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>init</td>
<td>initialize the minimization before a run</td>
</tr>
<tr>
<td>run</td>
<td>perform the minimization</td>
</tr>
<tr>
<td>memory_usage</td>
<td>tally of memory usage</td>
</tr>
</tbody>
</table>
15.12 Region styles

Classes that define geometric regions are derived from the Region class. Regions are used elsewhere in LAMMPS to group atoms, delete atoms to create a void, insert atoms in a specified region, etc. New styles can be created to add new region shapes to LAMMPS.

Region_sphere.cpp is an example of a spherical region.

Here is a brief description of methods you define in your new derived class. See region.h for details.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inside</td>
<td>determine whether a point is in the region</td>
</tr>
<tr>

<td>determine if a point is within a cutoff distance inside of surface</td>
</tr>
<tr>
<td>surface_exterior</td>
<td>determine if a point is within a cutoff distance outside of surface</td>
</tr>
<tr>
<td>shape_update</td>
<td>change region shape if set by time-dependent variable</td>
</tr>
</tbody>
</table>

15.13 Body styles

Classes that define body particles are derived from the Body class. Body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc.

See the Howto body doc page for an overview of using body particles and the various body styles LAMMPS supports. New styles can be created to add new kinds of body particles to LAMMPS.

Body_nparticle.cpp is an example of a body particle that is treated as a rigid body containing N sub-particles.

Here is a brief description of methods you define in your new derived class. See body.h for details.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_body</td>
<td>process a line from the Bodies section of a data file</td>
</tr>

<td>unpacking of those attributes</td>
</tr>
</tbody>
</table>

15.14 Thermodynamic output options

There is one class that computes and prints thermodynamic information to the screen and log file; see the file thermo.cpp.

There are two styles defined in thermo.cpp: “one” and “multi”. There is also a flexible “custom” style which allows the user to explicitly list keywords for quantities to print when thermodynamic info is output. See the thermo_style command for a list of defined quantities.

The thermo styles (one, multi, etc) are simply lists of keywords. Adding a new style thus only requires defining a new list of keywords. Search for the word “customize” with references to “thermo style” in thermo.cpp to see the two locations where code will need to be added.

New keywords can also be added to thermo.cpp to compute new quantities for output. Search for the word “customize” with references to “keyword” in thermo.cpp to see the several locations where code will need to be added.
Note that the `thermo_style custom` command already allows for thermo output of quantities calculated by `fixes`, `computes`, and `variables`. Thus, it may be simpler to compute what you wish via one of those constructs, than by adding a new keyword to the thermo command.

### 15.15 Variable options

There is one class that computes and stores `variable` information in LAMMPS; see the file variable.cpp. The value associated with a variable can be periodically printed to the screen via the `print`, `fix print`, or `thermo_style custom` commands. Variables of style “equal” can compute complex equations that involve the following types of arguments:

```plaintext
thermo keywords = ke, vol, atoms, ...
other variables = v_a, v_myvar, ...
math functions = div(x,y), mult(x,y), add(x,y), ...
group functions = mass(group), xcm(group,x), ...
atom values = x[123], y[3], vx[34], ...
compute values = c_mytemp[0], c_thermo_press[3], ...
```

Adding keywords for the `thermo_style custom` command (which can then be accessed by variables) is discussed on the Modify thermo doc page.

Adding a new math function of one or two arguments can be done by editing one section of the Variable::evaluate() method. Search for the word “customize” to find the appropriate location.

Adding a new group function can be done by editing one section of the Variable::evaluate() method. Search for the word “customize” to find the appropriate location. You may need to add a new method to the Group class as well (see the group.cpp file).

Accessing a new atom-based vector can be done by editing one section of the Variable::evaluate() method. Search for the word “customize” to find the appropriate location.

Adding new `compute styles` (whose calculated values can then be accessed by variables) is discussed on the Modify compute doc page.
This section describes the internal structure and basic algorithms of the LAMMPS code. This is a work in progress and additional information will be added incrementally depending on availability of time and requests from the LAMMPS user community.

16.1 LAMMPS source files

The source files of the LAMMPS code are found in two directories of the distribution: `src` and `lib`. Most of the code is C++ but there are small numbers of files in several other languages.

The core of the code is located in the `src` folder and its sub-directories. A sizable number of these files are in the `src` directory itself, but there are plenty of packages, which can be included or excluded when LAMMPS is built. See the Include packages in build section of the manual for more information about that part of the build process. LAMMPS currently supports building with conventional makefiles and through `CMake` which differ in how packages are enabled or disabled for a LAMMPS binary. The source files for each package are in all-uppercase sub-directories of the `src` folder, for example `src/MOLECULE` or `src/USER-MISC`. The `src/STUBS` sub-directory is not a package but contains a dummy MPI library, that is used when building a serial version of the code. The `src/MAKE` directory contains makefiles with settings and flags for a variety of configuration and machines for the build process with traditional makefiles.

The `lib` directory contains the source code for several supporting libraries or files with configuration settings to use globally installed libraries, that are required by some of the optional packages. Each sub-directory, like `lib/poems` or `lib/gpu`, contains the source files, some of which are in different languages such as Fortran or CUDA. These libraries are linked to during a LAMMPS build, if the corresponding package is installed.

LAMMPS C++ source files almost always come in pairs, such as `src/run.cpp` (implementation file) and `src/run.h` (header file). Each pair of files defines a C++ class, for example the `LAMMPS_NS::Run` class which contains the code invoked by the `run` command in a LAMMPS input script. As this example illustrates, source file and class names often have a one-to-one correspondence with a command used in a LAMMPS input script. Some source files and classes do not have a corresponding input script command, e.g. `src/force.cpp` and the `LAMMPS_NS::Force` class. They are discussed in the next section.

A small number of C++ classes and utility functions are implemented with only a .h file. Examples are the Pointer class or the MathVec functions.
16.2 LAMMPS class topology

Though LAMMPS has a lot of source files and classes, its class topology is relative flat, as outlined in the LAMMPS class topology figure. Each name refers to a class and has a pair of associated source files in the src folder, for example the class LAMMPS_NS::Memory corresponds to the files memory.cpp and memory.h, or the class LAMMPS_NS::AtomVec corresponds to the files atom_vec.cpp and atom_vec.h. Full lines in the figure represent compositing: that is the class to the left holds a pointer to an instance of the class to the right. Dashed lines instead represent inheritance: the class to the right is derived from the class on the left. Classes with a red boundary are not instantiated directly, but they represent the base classes for “styles”. Those “styles” make up the bulk of the LAMMPS code and only a few typical examples are included in the figure for demonstration purposes.

The LAMMPS_NS::LAMMPS class is the topmost class and represents what is referred to an “instance” of LAMMPS. It is a composite holding references to instances of other core classes providing the core functionality of the MD engine in LAMMPS and through them abstractions of the required operations. The constructor of the LAMMPS class will instantiate those instances, process the command line flags, initialize MPI (if not already done) and set up file pointers for input and output. The destructor will shut everything down and free all associated memory. Thus code for the standalone LAMMPS executable in main.cpp simply initializes MPI, instantiates a single instance of LAMMPS, and passes it the command line flags and input script. It deletes the LAMMPS instance after the method reading the input returns and shuts down the MPI environment before it exits the executable.

The LAMMPS_NS::Pointers is not shown in the LAMMPS class topology figure, it holds references to members of the LAMMPS_NS::LAMMPS, so that all classes derived from LAMMPS_NS::Pointers have direct access to those reference. From the class topology all classes with blue boundary are referenced in this class and all classes in the second and third columns, that are not listed as derived classes are instead derived from LAMMPS_NS::Pointers.

Since all storage is encapsulated, the LAMMPS class can also be instantiated multiple times by a calling code, and that can be either simultaneously or consecutively. When running in parallel with MPI, care has to be taken, that suitable communicators are used to not create conflicts between different instances.

The LAMMPS class currently holds instances of 19 classes representing different core functionalities There are a handful of virtual parent classes in LAMMPS that define what LAMMPS calls styles. They are shaded red in the LAMMPS class topology figure. Each of these are parents of a number of child classes that implement the interface defined by the parent class. There are two main categories of these styles: some may only have one instance active at a time (e.g. atom, pair, bond, angle, dihedral, improper, kspace, comm) and there is a dedicated pointer variable in the composite class that manages them. Setups that require a mix of different such styles have to use a hybrid class that manages and forwards calls to the corresponding sub-styles for the designated subset of atoms or data. or the composite class may have lists of class instances, e.g. Modify handles lists of compute and fix styles, while Output handles dumps class instances.

The exception to this scheme are the command style classes. These implement specific commands that can be invoked before, after, or between runs or are commands which launch a simulation. For these an instance of the class is created, its command() method called and then, after completion, the class instance deleted. Examples for this are the create_box, create_atoms, minimize, run, or velocity command styles.

For all those styles certain naming conventions are employed: for the fix nve command the class is called FixNVE and the files are fix_nve.h and fix_nve.cpp. Similarly for fix ave/time we have FixAveTime and fix_ave_time.h and fix_ave_time.cpp. Style names are lower case and without spaces or special characters. A suffix or multiple appended with a forward slash '/' denotes a variant of the corresponding class without the suffix. To connect the style name and the class name, LAMMPS uses macros like the following ATOM_CLASS, PAIR_CLASS, BOND_CLASS, REGION_CLASS, FIX_CLASS, COMPUTE_CLASS, or DUMP_CLASS in the corresponding header file. During compilation files with the pattern style_name.h are created that contain include statements including all headers of all styles of a given type that are currently active (or “installed).

More details on individual classes in the LAMMPS class topology are as follows:

- The Memory class handles allocation of all large vectors and arrays.
- The Error class prints all error and warning messages.
Fig. 1: LAMMPS class topology

This figure shows some of the relations of the base classes of the LAMMPS simulation package. Full lines indicate that a class holds an instance of the class it is pointing to; dashed lines point to derived classes that are given as examples of what classes may be instantiated during a LAMMPS run based on the input commands and accessed through the API defined by their respective base classes. At the core is the LAMMPS class, which holds pointers to class instances with specific purposes. Those may hold instances of other classes, sometimes directly, or only temporarily, sometimes as derived classes or derived classes of derived classes, which
• The Universe class sets up partitions of processors so that multiple simulations can be run, each on a subset of the processors allocated for a run, e.g. by the mpirun command.

• The Input class reads and processes input strings and files, stores variables, and invokes commands.

• As discussed above, command style classes are directly derived from the Pointers class. They provide input script commands that perform one-time operations before/after/between simulations or which invoke a simulation. They are instantiated from within the Input class, invoked, then immediately destructed.

• The Finish class is instantiated to print statistics to the screen after a simulation is performed, by commands like run and minimize.

• The Special class walks the bond topology of a molecular system to find first, second, third neighbors of each atom. It is invoked by several commands, like read_data, read_restart, or replicate.

• The Atom class stores per-atom properties associated with atom styles. More precisely, they are allocated and managed by a class derived from the AtomVec class, and the Atom class simply stores pointers to them. The classes derived from AtomVec represent the different atom styles and they are instantiated through the atom_style command.

• The Update class holds instances of an integrator and a minimizer class. The Integrate class is a parent style for the Verlet and r-RESPA time integrators, as defined by the run_style command. The Min class is a parent style for various energy minimizers.

• The Neighbor class builds and stores neighbor lists. The NeighList class stores a single list (for all atoms). A NeighRequest class instance is created by pair, fix, or compute styles when they need a particular kind of neighbor list and use the NeighRequest properties to select the neighbor list settings for the given request. There can be multiple instances of the NeighRequest class and the Neighbor class will try to optimize how they are computed by creating copies or sub-lists where possible.

• The Comm class performs inter-processor communication, typically of ghost atom information. This usually involves MPI message exchanges with 6 neighboring processors in the 3d logical grid of processors mapped to the simulation box. There are two communication styles enabling different ways to do the domain decomposition. Sometimes the Irregular class is used, when atoms may migrate to arbitrary processors.

• The Domain class stores the simulation box geometry, as well as geometric Regions and any user definition of a Lattice. The latter are defined by the region and lattice commands in an input script.

• The Force class computes various forces between atoms. The Pair parent class is for non-bonded or pair-wise forces, which in LAMMPS also includes many-body forces such as the Tersoff 3-body potential if those are computed by walking pairwise neighbor lists. The Bond, Angle, Dihedral, Improper parent classes are styles for bonded interactions within a static molecular topology. The KSpace parent class is for computing long-range Coulombic interactions. One of its child classes, PPPM, uses the FFT3D and Remap classes to redistribute and communicate grid-based information across the parallel processors.

• The Modify class stores lists of class instances derived from the Fix and Compute base classes.

• The Group class manipulates groups that atoms are assigned to via the group command. It also has functions to compute various attributes of groups of atoms.

• The Output class is used to generate 3 kinds of output from a LAMMPS simulation: thermodynamic information printed to the screen and log file, dump file snapshots, and restart files. These correspond to the Thermo, Dump, and WriteRestart classes respectively. The Dump class is a base class with several derived classes implementing various dump style variants.

• The Timer class logs timing information, output at the end of a run.
16.3 How a timestep works

The first and most fundamental operation within LAMMPS to understand is how a timestep is structured. Timestepping is performed by calling methods of the Integrate class instance within the Update class. Since Integrate is a base class, it will point to an instance of a derived class corresponding to what is selected by the run_style input script command.

In this section, the timestep implemented by the Verlet class is described. A similar timestep protocol is implemented by the Respa class, for the r-RESPA hierarchical timestepping method.

The Min base class performs energy minimization, so does not perform a literal timestep. But it has logic similar to what is described here, to compute forces and invoke fixes at each iteration of a minimization. Differences between time integration and minimization are highlighted at the end of this section.

The Verlet class is encoded in the src/verlet.cpp and verlet.h files. It implements the velocity-Verlet timestepping algorithm. The workhorse method is Verlet::run(), but first we highlight several other methods in the class.

- The init() method is called at the beginning of each dynamics run. It simply sets some internal flags, based on user settings in other parts of the code.

- The setup() or setup_minimal() methods are also called before each run. The velocity-Verlet method requires current forces be calculated before the first timestep, so these routines compute forces due to all atomic interactions, using the same logic that appears in the timestepping described next. A few fixes are also invoked, using the mechanism described in the next section. Various counters are also initialized before the run begins. The setup_minimal() method is a variant that has a flag for performing less setup. This is used when runs are continued and information from the previous run is still valid. For example, if repeated short LAMMPS runs are being invoked, interleaved by other commands, via the pre no and every options of the run command, the setup_minimal() method is used.

- The force_clear() method initializes force and other arrays to zero before each timestep, so that forces (torques, etc) can be accumulated.

Now for the Verlet::run() method. Its basic structure in hi-level pseudo code is shown below. In the actual code in src/verlet.cpp some of these operations are conditionally invoked.

```cpp
loop over N timesteps:
  if timeout condition: break
  ev_set()
  fix->initial_integrate()
  fix->post_integrate()
  nflag = neighbor->decide()
  if nflag:
    fix->pre_exchange()
    domain->pbc()
    domain->reset_box()
    comm->setup()
    neighbor->setup_bins()
    comm->exchange()
    comm->borders()
    fix->pre_neighbor()
    neighbor->build()
    fix->post_neighbor()
  else:
    comm->forward_comm()
  force_clear()
```

(continues on next page)
The `ev_set()` method (in the parent Integrate class), sets two flags (`eflag` and `vflag`) for energy and virial computation. Each flag encodes whether global and/or per-atom energy and virial should be calculated on this timestep, because some fix or variable or output will need it. These flags are passed to the various methods that compute particle interactions, so that they either compute and tally the corresponding data or can skip the extra calculations if the energy and virial are not needed. See the comments for the `Integrate::ev_set()` method which document the flag values.

At various points of the timestep, fixes are invoked, e.g. `fix->initial_integrate()`. In the code, this is actually done via the Modify class which stores all the Fix objects and lists of which should be invoked at what point in the timestep. Fixes are the LAMMPS mechanism for tailoring the operations of a timestep for a particular simulation. As described elsewhere, each fix has one or more methods, each of which is invoked at a specific stage of the timestep, as show in the timestep pseudo-code. All the active fixes defined in an input script, that are flagged to have an `initial_integrate()` method are invoked at the beginning of each timestep. Examples are `fix nve` or `fix nvt` or `fix npt` which perform the start-of-timestep velocity-Verlet integration operations to update velocities by a half-step, and coordinates by a full step. The `post_integrate()` method is next for operations that need to happen immediately after those updates. Only a few fixes use this, e.g. to reflect particles off box boundaries in the `FixWallReflect` class.

The `decide()` method in the Neighbor class determines whether neighbor lists need to be rebuilt on the current timestep (conditions can be changed using the `neigh_modify every/delay/check` command. If not, coordinates of ghost atoms are acquired by each processor via the `forward_comm()` method of the Comm class. If neighbor lists need to be built, several operations within the inner if clause of the pseudo-code are first invoked. The `pre_exchange()` method of any defined fixes is invoked first. Typically this inserts or deletes particles from the system. Periodic boundary conditions are then applied by the Domain class via its `pbc()` method to remap particles that have moved outside the simulation box back into the box. Note that this is not done every timestep, but only when neighbor lists are rebuilt. This is so that each processor’s sub-domain will have consistent (nearby) atom coordinates for its owned and ghost atoms. It is also why dumped atom coordinates may be slightly outside the simulation box if not dumped on a step where the neighbor lists are rebuilt.

The box boundaries are then reset (if needed) via the `reset_box()` method of the Domain class, e.g. if box boundaries are shrink-wrapped to current particle coordinates. A change in the box size or shape requires internal information for communicating ghost atoms (Comm class) and neighbor list bins (Neighbor class) be updated. The `setup()` method of the Comm class and `setup_bins()` method of the Neighbor class perform the update.
The code is now ready to migrate atoms that have left a processor’s geometric sub-domain to new processors. The `exchange()` method of the Comm class performs this operation. The `borders()` method of the Comm class then identifies ghost atoms surrounding each processor’s sub-domain and communicates ghost atom information to neighboring processors. It does this by looping over all the atoms owned by a processor to make lists of those to send to each neighbor processor. On subsequent timesteps, the lists are used by the `Comm::forward_comm()` method.

Fixes with a `pre_neighbor()` method are then called. These typically re-build some data structure stored by the fix that depends on the current atoms owned by each processor.

Now that each processor has a current list of its owned and ghost atoms, LAMMPS is ready to rebuild neighbor lists via the `build()` method of the Neighbor class. This is typically done by binning all owned and ghost atoms, and scanning a stencil of bins around each owned atom’s bin to make a Verlet list of neighboring atoms within the force cutoff plus neighbor skin distance.

In the next portion of the timestep, all interaction forces between particles are computed, after zeroing the per-atom force vector via the `force_clear()` method. If the newton flag is set to `on` by the newton command, forces are added to both owned and ghost atoms, otherwise only to owned (aka local) atoms.

Pairwise forces are calculated first, which enables the global virial (if requested) to be calculated cheaply (at O(N) cost instead of O(N**2) at the end of the `Pair::compute()` method), by a dot product of atom coordinates and forces. By including owned and ghost atoms in the dot product, the effect of periodic boundary conditions is correctly accounted for. Molecular topology interactions (bonds, angles, dihedrals, impropers) are calculated next (if supported by the current atom style). The final contribution is from long-range Coulombic interactions, invoked by the KSpace class.

The `pre_reverse()` method in fixes is used for operations that have to be done *before* the upcoming reverse communication (e.g. to perform additional data transfers or reductions for data computed during the force computation and stored with ghost atoms).

If the newton flag is on, forces on ghost atoms are communicated and summed back to their corresponding owned atoms. The `reverse_comm()` method of the Comm class performs this operation, which is essentially the inverse operation of sending copies of owned atom coordinates to other processor’s ghost atoms.

At this point in the timestep, the total force on each (local) atom is known. Additional force constraints (external forces, SHAKE, etc) are applied by Fixes that have a `post_force()` method. The second half of the velocity-Verlet integration, `final_integrate()` is then performed (another half-step update of the velocities) via fixes like nve, nvt, npt.

At the end of the timestep, fixes that contain an `end_of_step()` method are invoked. These typically perform a diagnostic calculation, e.g. the ave/time and ave/spatial fixes. The final operation of the timestep is to perform any requested output, via the `write()` method of the Output class. There are 3 kinds of LAMMPS output: thermodynamic output to the screen and log file, snapshots of atom data to a dump file, and restart files. See the `thermo_style`, `dump`, and `restart` commands for more details.

The flow of control during energy minimization iterations is similar to that of a molecular dynamics timestep. Forces are computed, neighbor lists are built as needed, atoms migrate to new processors, and atom coordinates and forces are communicated to neighboring processors. The only difference is what Fix class operations are invoked when. Only a subset of LAMMPS fixes are useful during energy minimization, as explained in their individual doc pages. The relevant Fix class methods are `min_pre_exchange()`, `min_pre_force()`, and `min_post_force()`. Each fix is invoked at the appropriate place within the minimization iteration. For example, the `min_post_force()` method is analogous to the `post_force()` method for dynamics; it is used to alter or constrain forces on each atom, which affects the minimization procedure.

After all iterations are completed there is a cleanup step which calls the `post_run()` method of fixes to perform operations only required at the end of a calculations (like freeing temporary storage or creating final outputs).
16.4 Writing LAMMPS styles

The Modifying & extending LAMMPS section of the manual gives an overview of how LAMMPS can be extended by writing new classes that derive from existing parent classes in LAMMPS. Here, some specific coding details are provided for writing code for LAMMPS.

16.4.1 Writing a new fix style

Writing fixes is a flexible way of extending LAMMPS. Users can implement many things using fixes:

- changing particles attributes (positions, velocities, forces, etc.). Examples: FixNVE, FixFreeze.
- reading/writing data. Example: FixRestart.
- adding or modifying properties due to geometry. Example: FixWall.
- interacting with other subsystems or external code: Examples: FixTTM, FixExternal, FixLATTE
- saving information for analysis or future use (previous positions, for instance). Examples: Fix AveTime, FixStoreState.

All fixes are derived from the Fix base class and must have a constructor with the signature: `FixPrintVel(class LAMMPS *, int, char **)`.

Every fix must be registered in LAMMPS by writing the following lines of code in the header before include guards:

```cpp
#ifdef FIX_CLASS
FixStyle(print/vel,FixPrintVel)
#else
/* the definition of the FixPrintVel class comes here */
...
#endif
```

Where `print/vel` is the style name of your fix in the input script and `FixPrintVel` is the name of the class. The header file would be called `fix_print_vel.h` and the implementation file `fix_print_vel.cpp`. These conventions allow LAMMPS to automatically integrate it into the executable when compiling and associate your new fix class with the designated keyword when it parses the input script.

Let’s write a simple fix which will print the average velocity at the end of each timestep. First of all, implement a constructor:

```cpp
FixPrintVel::FixPrintVel(LAMMPS *lmp, int narg, char **arg) :
   Fix(lmp, narg, arg)
{
   if (narg < 4)
      error->all(FLERR,"Illegal fix print/vel command");
   nevery = force->inumeric(FLERR,arg[3]);
   if (nevery <= 0)
      error->all(FLERR,"Illegal fix print/vel command");
}
```

In the constructor you should parse your fix arguments which are specified in the script. All fixes have pretty the same syntax: `fix <fix-ID> <fix group> <fix name> <fix arguments ...>`. The first 3 parameters are parsed by Fix base class constructor, while `<fix arguments>` should be parsed by you. In our case, we need to specify how often we want to print an average velocity. For instance, once in 50 timesteps: `fix 1 print/vel 50`. There is a special variable in the Fix class called `nevery` which specifies how often the method `end_of_step()` is called. Thus all we need to do is just set it up.
The next method we need to implement is `setmask()`:

```cpp
int FixPrintVel::setmask()
{
    int mask = 0;
    mask |= FixConst::END_OF_STEP;
    return mask;
}
```

Here the user specifies which methods of your fix should be called during execution. The constant `END_OF_STEP` corresponds to the `end_of_step()` method. The most important available methods that are called during a timestep and the order in which they are called are shown in the previous section.

```cpp
void FixPrintVel::end_of_step()
{
    // for add3, scale3
    using namespace MathExtra;
    double** v = atom->v;
    int nlocal = atom->nlocal;
    double localAvgVel[4]; // 4th element for particles count
    memset(localAvgVel, 0, 4 * sizeof(double));
    for (int particleInd = 0; particleInd < nlocal; ++particleInd) {
        add3(localAvgVel, v[particleInd], localAvgVel);
    }
    localAvgVel[3] = nlocal;
    double globalAvgVel[4];
    memset(globalAvgVel, 0, 4 * sizeof(double));
    MPI_Allreduce(localAvgVel, globalAvgVel, 4, MPI_DOUBLE, MPI_SUM, world);
    scale3(1.0 / globalAvgVel[3], globalAvgVel);
    if ((comm->me == 0) && screen) {
        fmt::print(screen,"{}, {}, {}

        ",
        globalAvgVel[0], globalAvgVel[1], globalAvgVel[2]);
    }
}
```

In the code above, we use MathExtra routines defined in `math_extra.h`. There are bunch of math functions to work with arrays of doubles as with math vectors. It is also important to note that LAMMPS code should always assume to be run in parallel and that atom data is thus distributed across the MPI ranks. Thus you can only process data from local atoms directly and need to use MPI library calls to combine or exchange data. For serial execution, LAMMPS comes bundled with the MPI STUBS library that contains the MPI library function calls in dummy versions that only work for a single MPI rank.

In this code we use an instance of Atom class. This object is stored in the Pointers class (see `pointers.h`) which is the base class of the Fix base class. This object contains references to various class instances (the original instances are created and held by the LAMMPS class) with all global information about the simulation system. Data from the Pointers class is available to all classes inherited from it using protected inheritance. Hence when you write you own class, which is going to use LAMMPS data, don’t forget to inherit from Pointers or pass an Pointer to it to all functions that need access. When writing fixes we inherit from class Fix which is inherited from Pointers so there is no need to inherit from it directly.

The code above computes average velocity for all particles in the simulation. Yet you have one unused parameter in fix call from the script: `group_name`. This parameter specifies the group of atoms used in the fix. So we should compute average for all particles in the simulation only if `group_name == "all"`, but it can be any group. The group membership information of an atom is contained in the `mask` property of and atom and the bit corresponding to a given group is stored in the groupbit variable which is defined in Fix base class:
for (int i = 0; i < nlocal; ++i) {
    if (atom->mask[i] & groupbit) {
        // Do all job here
    }
}

Class Atom encapsulates atoms positions, velocities, forces, etc. User can access them using particle index. Note, that particle indexes are usually changed every few timesteps because of neighbor list rebuilds and spatial sorting (to improve cache efficiency).

Let us consider another Fix example: We want to have a fix which stores atoms position from previous time step in your fix. The local atoms indexes may not be valid on the next iteration. In order to handle this situation there are several methods which should be implemented:

- **double memory_usage()**: return how much memory the fix uses (optional)
- **void grow_arrays(int)**: do reallocation of the per particle arrays in your fix
- **void copy_arrays(int i, int j, int delflag)**: copy i-th per-particle information to j-th. Used when atom sorting is performed. if delflag is set and atom j owns a body, move the body information to atom i.
- **void set_arrays(int i)**: sets i-th particle related information to zero

Note, that if your class implements these methods, it must call add calls of add_callback and delete_callback to constructor and destructor. Since we want to store positions of atoms from previous timestep, we need to add double** xold to the header file. Than add allocation code to the constructor:

```cpp
FixSavePos::FixSavePos(LAMMPS *lmp, int narg, char **arg), xold(nullptr)
{
    //...
    memory->create(xold, atom->nmax, 3, "FixSavePos:x");
    atom->add_callback(0);
}
FixSavePos::~FixSavePos() {
    atom->delete_callback(id, 0);
    memory->destroy(xold);
}
```

Implement the aforementioned methods:

```cpp
double FixSavePos::memory_usage()
{
    int nmax = atom->nmax;
    double bytes = 0.0;
    bytes += nmax * 3 * sizeof(double);
    return bytes;
}
void FixSavePos::grow_arrays(int nmax)
{
    memory->grow(xold, nmax, 3, "FixSavePos:xold");
}
void FixSavePos::copy_arrays(int i, int j, int delflag)
{
    memcpy(xold[j], xold[i], sizeof(double) * 3);
}
```

(continues on next page)
void FixSavePos::set_arrays(int i)
{
    memset(xold[i], 0, sizeof(double) * 3);
}

int FixSavePos::pack_exchange(int i, double *buf)
{
    int m = 0;
    buf[m++] = xold[i][0];
    buf[m++] = xold[i][1];
    buf[m++] = xold[i][2];

    return m;
}

int FixSavePos::unpack_exchange(int nlocal, double *buf)
{
    int m = 0;
    xold[nlocal][0] = buf[m++];
    xold[nlocal][1] = buf[m++];
    xold[nlocal][2] = buf[m++];

    return m;
}

Now, a little bit about memory allocation. We use the Memory class which is just a bunch of template functions for allocating 1D and 2D arrays. So you need to add include memory.h to have access to them.

Finally, if you need to write/read some global information used in your fix to the restart file, you might do it by setting flag restart_global = 1 in the constructor and implementing methods void write_restart(FILE *fp) and void restart(char *buf). If, in addition, you want to write the per-atom property to restart files additional settings and functions are needed:

- a fix flag indicating this needs to be set restart_peratom = 1;
- atom->add_callback() and atom->delete_callback() must be called a second time with the final argument set to 1 instead of 0 (indicating restart processing instead of per-atom data memory management).
- the functions void pack_restart(int i, double *buf) and void unpack_restart(int nlocal, int nth) need to be implemented
16.5 LAMMPS utility functions

The `utils` sub-namespace inside the `LAMMPS_NS` namespace provides a collection of convenience functions and utilities that perform common tasks that are required repeatedly throughout the LAMMPS code like reading or writing to files with error checking or translation of strings into specific types of numbers with checking for validity. This reduces redundant implementations and encourages consistent behavior.

16.5.1 I/O with status check

These are wrappers around the corresponding C library calls like `fgets()` or `fread()`. They will check if there were errors on reading or an unexpected end-of-file state was reached. In that case, the functions will stop the calculation with an error message, indicating the name of the problematic file, if possible.

```c
void LAMMPS_NS::utils::sfgets (const char *srcname, int srcline, char *s, int size, FILE *fp, const char *filename, Error *error)
    // safe wrapper around fgets() which aborts on errors or EOF and prints a suitable error message to help debugging

Parameters

• srcname: name of the calling source file (from FLERR macro)
• srcline: line in the calling source file (from FLERR macro)
• s: buffer for storing the result of fgets()
• size: size of buffer s (max number of bytes read by fgets())
• fp: file pointer used by fgets()
• filename: file name associated with fp (may be a null pointer; then LAMMPS will try to detect)
• error: pointer to Error class instance (for abort)

void LAMMPS_NS::utils::sfread (const char *srcname, int srcline, void *s, size_t size, size_t num, FILE *fp, const char *filename, Error *error)
    // safe wrapper around fread() which aborts on errors or EOF and prints a suitable error message to help debugging

Parameters

• srcname: name of the calling source file (from FLERR macro)
• srcline: line in the calling source file (from FLERR macro)
• s: buffer for storing the result of fread()
• size: size of data elements read by fread()
• num: number of data elements read by fread()
• fp: file pointer used by fread()
• filename: file name associated with fp (may be a null pointer; then LAMMPS will try to detect)
• error: pointer to Error class instance (for abort)
16.5.2 String to number conversions with validity check

These functions should be used to convert strings to numbers. They are strongly preferred over C library calls like `atoi()` or `atof()` since they check if the entire provided string is a valid (floating-point or integer) number, and will error out instead of silently returning the result of a partial conversion or zero in cases where the string is not a valid number. This behavior allows to more easily detect typos or issues when processing input files.

The `do_abort` flag should be set to `true` in case this function is called only on a single MPI rank, as that will then trigger the a call to `Error::one()` for errors instead of `Error::all()` and avoids a “hanging” calculation when run in parallel.

Please also see `is_integer()` and `is_double()` for testing strings for compliance without conversion.

```cpp
double LAMMPS_NS::utils::numeric(const char *file, int line, const char *str, bool do_abort, LAMMPS *lmp)
Convert a string to a floating point number while checking if it is a valid floating point or integer number
Return double precision floating point number
Parameters
• file: name of source file for error message
• line: line number in source file for error message
• str: string to be converted to number
• do_abort: determines whether to call Error::one() or Error::all()
• lmp: pointer to top-level LAMMPS class instance
```

```cpp
int LAMMPS_NS::utils::inumeric(const char *file, int line, const char *str, bool do_abort, LAMMPS *lmp)
Convert a string to an integer number while checking if it is a valid integer number (regular int)
Return integer number (regular int)
Parameters
• file: name of source file for error message
• line: line number in source file for error message
• str: string to be converted to number
• do_abort: determines whether to call Error::one() or Error::all()
• lmp: pointer to top-level LAMMPS class instance
```

```cpp
bigint LAMMPS_NS::utils::bnumeric(const char *file, int line, const char *str, bool do_abort, LAMMPS *lmp)
Convert a string to an integer number while checking if it is a valid integer number (bigint)
Return integer number (bigint)
Parameters
• file: name of source file for error message
• line: line number in source file for error message
• str: string to be converted to number
```

16.5. LAMMPS utility functions
do_abort: determines whether to call Error::one() or Error::all()

lmp: pointer to top-level LAMMPS class instance

tagint LAMMPS_NS::utils::tnumeric(const char *file, int line, const char *str, bool do_abort, LAMMPS *lmp)
Convert a string to an integer number while checking if it is a valid integer number (tagint)

Return integer number (tagint)

Parameters

- file: name of source file for error message
- line: line number in source file for error message
- str: string to be converted to number
- do_abort: determines whether to call Error::one() or Error::all()
- lmp: pointer to top-level LAMMPS class instance

16.5.3 String processing

The following are functions to help with processing strings and parsing files or arguments.

std::string LAMMPS_NS::utils::trim(const std::string &line)
Trim leading and trailing whitespace. Like TRIM() in Fortran.

Return new string without whitespace (string)

Parameters

- line: string that should be trimmed

std::string LAMMPS_NS::utils::trim_comment(const std::string &line)
Return string with anything from '#' onward removed

Return new string without comment (string)

Parameters

- line: string that should be trimmed

size_t LAMMPS_NS::utils::count_words(const char *text)
Count words in C-string, ignore any whitespace matching " \n\n\f"

Return number of words found

Parameters

- text: string that should be searched

size_t LAMMPS_NS::utils::count_words(const std::string &text)
Count words in string, ignore any whitespace matching " \n\n\f"

Return number of words found

Parameters
size_t LAMMPS_NS::utils::count_words(const std::string &text, const std::string &separators)
Count words in string with custom choice of separating characters

Return  number of words found

Parameters
•  text: string that should be searched
•  separators: string containing characters that will be treated as whitespace

size_t LAMMPS_NS::utils::trim_and_count_words(const std::string &text, const std::string &separators = " \
\n\f")
Count words in a single line, trim anything from ‘#’ onward

Return  number of words found

Parameters
•  text: string that should be trimmed and searched
•  separators: string containing characters that will be treated as whitespace

std::vector<std::string> LAMMPS_NS::utils::split_words(const std::string &text)
Take text and split into non-whitespace words.
This can handle strings with single and double quotes, escaped quotes, and escaped codes within quotes, but due to using an STL container and STL strings is rather slow because of making copies. Designed for parsing command lines and similar text and not for time critical processing. Use a tokenizer class for that.

See also  Tokenizer, ValueTokenizer

bool LAMMPS_NS::utils::strmatch(const std::string &text, const std::string &pattern)
Match text against a simplified regex pattern

More flexible and specific matching of a string against a pattern. This function is supposed to be a more safe, more specific and simple to use API to find pattern matches. The purpose is to replace uses of either strncmp() or strstr() in the code base to find sub-strings safely. With strncmp() finding prefixes, the number of characters to match must be counted, which can lead to errors, while using “^pattern” will do the same with less problems. Matching for suffixes using strstr() is not as specific as ‘pattern$’, and complex matches, e.g. “^rigid.*\small.*”, to match all small body optimized rigid fixes require only one test.

Return  true if the pattern matches, false if not

Parameters
•  text: the text to be matched against the pattern
•  pattern: the search pattern, which may contain regexp markers

The use of std::string arguments allows for simple concatenation even with char * type variables. Example: utils::strmatch(text, std::string("^\") + charptr)
bool LAMMPS_NS::utils::is_integer(const std::string &str)
    Check if string can be converted to valid integer
    
    **Return** true, if string contains valid integer, false otherwise
    **Parameters**
    • str: string that should be checked

bool LAMMPS_NS::utils::is_double(const std::string &str)
    Check if string can be converted to valid floating-point number
    
    **Return** true, if string contains valid number, false otherwise
    **Parameters**
    • str: string that should be checked

### 16.5.4 File and path functions

**const** char *LAMMPS_NS::utils::guesspath(char *buf, int len, FILE *fp)
    Try to detect pathname from FILE pointer.
    
    Currently only supported on Linux, otherwise will report “(unknown)”. On Linux the folder /proc/self/fd holds symbolic links to the actual pathnames associated with each open file descriptor of the current process.
    
    **Return** pointer to the storage buffer, i.e. buf
    **Parameters**
    • buf: storage buffer for pathname. output will be truncated if not large enough
    • len: size of storage buffer. output will be truncated to this length - 1
    • fp: FILE pointer struct from STDIO library for which we want to detect the name
    
This function is used to provide a filename with error messages in functions where the filename is not passed as an argument, but the FILE * pointer.

std::string LAMMPS_NS::utils::path_basename(const std::string &path)
    Strip off leading part of path, return just the filename
    
    **Return** file name
    **Parameters**
    • path: file path

std::string LAMMPS_NS::utils::path_join(const std::string &a, const std::string &b)
    Join two pathname segments
    
    This uses the forward slash ‘/’ character unless LAMMPS is compiled for Windows where it used the equivalent backward slash ‘\’.
    
    **Return** combined path
    **Parameters**
    • a: first path
    • b: second path
bool LAMMPS_NS::utils::file_is_readable(const std::string &path)
    Check if file exists and is readable

    Return true if file exists and is readable

    Parameters
    • path: file path

16.5.5 Potential file functions

std::string LAMMPS_NS::utils::get_potential_file_path(const std::string &path)
    Determine full path of potential file. If file is not found in current directory, search directories listed in
    LAMMPS_POTENTIALS environment variable

    Return full path to potential file

    Parameters
    • path: file path

std::string LAMMPS_NS::utils::get_potential_date(const std::string &path, const std::string &potential_name)
    Read potential file and return DATE field if it is present

    Return DATE field if present

    Parameters
    • path: file path
    • potential_name: name of potential that is being read

std::string LAMMPS_NS::utils::get_potential_units(const std::string &path, const std::string &potential_name)
    Read potential file and return UNITS field if it is present

    Return UNITS field if present

    Parameters
    • path: file path
    • potential_name: name of potential that is being read

int LAMMPS_NS::utils::get_supported_conversions(const int property)
    Return bitmask of available conversion factors for a given property

    Return bitmask indicating available conversions

    Parameters
    • property: property to be converted

double LAMMPS_NS::utils::get_conversion_factor(const int property, const int conversion)
    Return unit conversion factor for given property and selected from/to units

    Return conversion factor
Parameters

- **property**: property to be converted
- **conversion**: constant indicating the conversion

FILE *LAMMPS_NS::utils::open_potential(const std::string &name, LAMMPS *lmp, int *auto_convert)

Open a potential file as specified by name

If opening the file directly fails, the function will search for it in the list of folder pointed to by the environment variable LAMMPS_POTENTIALS (if it is set).

If the potential file has a UNITS tag in the first line, the tag’s value is compared to the current unit style setting. The behavior of the function then depends on the value of the auto_convert parameter. If it is a null pointer, then the unit values must match or else the open will fail with an error. Otherwise the bitmask that auto_convert points to is used check for compatibility with possible automatic conversions by the calling function. If compatible, the bitmask is set to the required conversion or utils::NOCONVERT.

Return FILE pointer of the opened potential file or nullptr

Parameters

- **name**: file- or pathname of the potential file
- **lmp**: pointer to top-level LAMMPS class instance
- **auto_convert**: pointer to unit conversion bitmask or nullptr

16.5.6 Argument processing

template<typename TYPE>
void LAMMPS_NS::utils::bounds (const char *file, int line, const std::string &str, bigint nmin, bigint nmax, TYPE &nlo, TYPE & nhi, Error *error)

Compute index bounds derived from a string with a possible wildcard

This functions processes the string in str and set the values of nlo and nhi according to the following five cases:

- a single number, i: nlo = i; nhi = i;
- a single asterisk, *: nlo = nmin; nhi = nmax;
- a single number followed by an asterisk, i*: nlo = i; nhi = nmax;
- a single asterisk followed by a number, *i: nlo = nmin; nhi = i;
- two numbers with an asterisk in between. i*j: nlo = i; nhi = j;

Parameters

- **file**: name of source file for error message
- **line**: line number in source file for error message
- **str**: string to be processed
- **nmin**: smallest possible lower bound
- **nmax**: largest allowed upper bound
- **nlo**: lower bound
- **nhi**: upper bound
• error: pointer to Error class for out-of-bounds messages

```c
int LAMMPS_NS::utils::expand_args(const char *file, int line, int narg, char **arg, int mode, char **&earg, LAMMPS *lmp)
```

Expand list of arguments when containing fix/compute wildcards

This function searches the list of arguments in arg for strings of the kind c_ID[*] or f_ID[*] referring to computes or fixes. Any such strings are replaced by one or more strings with the ‘*’ character replaced by the corresponding possible numbers as determined from the fix or compute instance. Other strings are just copied. If the mode parameter is set to 0, expand global vectors, but not global arrays; if it is set to 1, expand global arrays (by column) but not global vectors.

If any expansion happens, the earg list and all its strings are new allocations and must be freed explicitly by the caller. Otherwise arg and earg will point to the same address and no explicit de-allocation is needed by the caller.

Return  number of arguments in expanded list

Parameters

• file: name of source file for error message
• line: line number in source file for error message
• narg: number of arguments in current list
• arg: argument list, possibly containing wildcards
• mode: select between global vectors(=0) and arrays (=1)
• earg: new argument list with wildcards expanded
• lmp: pointer to top-level LAMMPS class instance

16.5.7 Convenience functions

```c
void LAMMPS_NS::utils::logmesg(LAMMPS *lmp, const std::string &mesg)
```

Send message to screen and logfile, if available

This function simplifies the repetitive task of outputting some message to both the screen and/or the log file. In combination with using fmt::format(), which returns the formatted text in a std::string() instance, this can be used to reduce operations previously requiring several lines of code to a single statement.

Parameters

• lmp: pointer to LAMMPS class instance
• mesg: message to be printed

```c
std::string LAMMPS_NS::utils::getsyserror()
```

return a string representing the current system error status

This is a wrapper around calling strerror(errno).

Return  error string

```c
std::string LAMMPS_NS::utils::check_packages_for_style(const std::string &style, const std::string &name, LAMMPS *lmp)
```

Report if a requested style is in a package or may have a typo

Return  string usable for error messages
LAMMPS Documentation

Parameters

- **style**: type of style that is to be checked for
- **name**: name of style that was not found
- **lmp**: pointer to top-level LAMMPS class instance

```cpp
double LAMMPS_NS::utils::timespec2seconds(const std::string &timespec)
```

Convert a time string to seconds

The strings “off” and “unlimited” result in -1

**Return** total in seconds

**Parameters**

- **timespec**: a string in the following format: ([HH:]MM:]SS)

```cpp
int LAMMPS_NS::utils::date2num(const std::string &date)
```

Convert a LAMMPS version date to a number

This will generate a number YYYYMMDD from a date string (with or without blanks) that is suitable for numerical comparisons, i.e. later dates will generate a larger number.

The day may or may not have a leading zero, the month is identified by the first 3 letters (so there may be more) and the year may be 2 or 4 digits (the missing 2 digits will be assumed as 20. That is 04 corresponds to 2004).

No check is made whether the date is valid.

**Return** date code

**Parameters**

- **date**: string in the format (Day Month Year)

### 16.5.8 Customized standard functions

```cpp
void LAMMPS_NS::utils::merge_sort(int *index, int num, void *ptr, int (*comp) int, int, void*)
```

Custom merge sort implementation

This function provides a custom upward hybrid merge sort implementation with support to pass an opaque pointer to the comparison function, e.g. for access to class members. This avoids having to use global variables. For improved performance, it uses an in-place insertion sort on initial chunks of up to 64 elements and switches to merge sort from then on.

**Parameters**

- **index**: Array with indices to be sorted
- **num**: Length of the index array
- **ptr**: Pointer to opaque object passed to comparison function
- **comp**: Pointer to comparison function
16.6 Communication buffer coding with *ubuf*

LAMMPS uses communication buffers where it collects data from various class instances and then exchanges the data with neighboring sub-domains. For simplicity those buffers are defined as double buffers and used for doubles and integer numbers. This presents a unique problem when 64-bit integers are used. While the storage needed for a double is also 64-bit, it cannot be used by a simple assignment. To get around that limitation, LAMMPS uses the *ubuf* union. It is used in the various “pack” and “unpack” functions in the LAMMPS classes to store and retrieve integers that may be 64-bit from the communication buffers.

```cpp
union LAMMPS_NS::ubuf
#include <lmptype.h>
```

Data structure for packing 32-bit and 64-bit integers

into double (communication) buffers

Using this union avoids aliasing issues by having member types (double, int) referencing the same buffer memory location.

The explicit constructor for 32-bit integers prevents compilers from (incorrectly) calling the double constructor when storing an int into a double buffer.

Usage:

Listing 1: To copy an integer into a double buffer:

```cpp
double buf[2];
int foo = 1;
tagint bar = 2<<40;
buf[1] = ubuf(foo).d;
```

Listing 2: To copy from a double buffer back to an int:

```cpp
foo = (int) ubuf(buf[1]).i;
bar = (tagint) ubuf(buf[2]).i;
```

The typecasts prevent compiler warnings about possible truncation issues.

**Public Functions**

- `ubuf(const double &arg)`
- `ubuf(const int64_t &arg)`
- `ubuf(const int &arg)`
16.7 Tokenizer classes

The purpose of the tokenizer classes is to simplify the recurring task of breaking lines of text down into words and/or numbers. Traditionally, LAMMPS code would be using the `strtok()` function from the C library for that purpose, but that function has two significant disadvantages: 1) it cannot be used concurrently from different LAMMPS instances since it stores its status in a global variable and 2) it modifies the string that it is processing. These classes were implemented to avoid both of these issues and also to reduce the amount of code that needs to be written.

The basic procedure is to create an instance of the tokenizer class with the string to be processed as an argument and then do a loop until all available tokens are read. The constructor has a default set of separator characters, but that can be overridden. The default separators are all “whitespace” characters, i.e. the space character, the tabulator character, the carriage return character, the linefeed character, and the form feed character.

Listing 3: Tokenizer class example listing entries of the PATH environment variable

```cpp
#include "tokenizer.h"
#include <cstdlib>
#include <string>
#include <iostream>

using namespace LAMMPS_NS;

int main(int, char **) {
    const char *path = getenv("PATH");

    if (path != nullptr) {
        Tokenizer p(path, ":");
        while (p.has_next())
            std::cout << "Entry: " << p.next() << "\n";
    }
    return 0;
}
```

Most tokenizer operations cannot fail except for `LAMMPS_NS::Tokenizer::next()` (when used without first checking with `LAMMPS_NS::Tokenizer::has_next()`) and `LAMMPS_NS::Tokenizer::skip()`. In case of failure, the class will throw an exception, so you may need to wrap the code using the tokenizer into a `try / catch` block to handle errors. The `LAMMPS_NS::ValueTokenizer` class may also throw an exception when a (type of) number is requested as next token that is not compatible with the string representing the next word.

Listing 4: ValueTokenizer class example with exception handling

```cpp
#include "tokenizer.h"
#include <cstdlib>
#include <string>
#include <iostream>

(continues on next page)```
using namespace LAMMPS_NS;

int main(int, char **)
{
    const char *text = "1 2 3 4 5 20.0 21 twentytwo 2.3";
    double num1(0), num2(0), num3(0), num4(0);

    ValueTokenizer t(text);
    // read 4 doubles after skipping over 5 numbers
    try {
        t.skip(5);
        num1 = t.next_double();
        num2 = t.next_double();
        num3 = t.next_double();
        num4 = t.next_double();
    } catch (TokenizerException &e) {
        std::cout << "Reading numbers failed: " << e.what() << "\n";
    }
    std::cout << "Values: " << num1 << " " << num2 << " " << num3 << " " << num4 << "\n";
    return 0;
}

This code example should produce the following output:

Reading numbers failed: Not a valid floating-point number: 'twentytwo'
Values: 20 21 0 0

class LAMMPS_NS::Tokenizer

Public Functions

Tokenizer(const std::string &str, const std::string &separators = TOK-ENIZER_DEFAULT_SEPARATORS)

Class for splitting text into words

This tokenizer will break down a string into sub-strings (i.e words) separated by the given separator characters.

See also ValueTokenizer, utils::split_words()

Parameters

- str: string to be processed
- separators: string with separator characters (default: " \
\t\r\n\f")

void reset()

Re-position the tokenizer state to the first word, i.e. the first non-separator character

void skip(int n)

Skip over a given number of tokens

Parameters
• n: number of tokens to skip over

bool has_next() const
    Indicate whether more tokens are available

    Return true if there are more tokens, false if not

bool contains(const std::string &str) const
    Search the text to be processed for a sub-string.

    Return true if string was found, false if not

Parameters
    • str: string to be searched for

std::string next()
    Retrieve next token.

    Return string with the next token

size_t count()
    Count number of tokens in text.

    Return number of counted tokens

std::vector<std::string> as_vector()
    Retrieve the entire text converted to an STL vector of tokens.

    Return The STL vector

class LAMMPS_NS::TokenizerException: public exception
    Subclassed by InvalidFloatException, InvalidIntegerException

Public Functions

TokenizerException(const std::string &msg, const std::string &token)
    Thrown during retrieving or skipping tokens

Parameters
    • msg: String with error message
    • token: String of the token/word that caused the error

const char *what() const
    Retrieve message describing the thrown exception

    Return string with error message

class LAMMPS_NS::ValueTokenizer
Public Functions

ValueTokenizer(const std::string &str, const std::string &separators = TOK-ENIZER_DEFAULT_SEPARATORS)

Class for reading text with numbers

See also Tokenizer

See Tokenizer InvalidIntegerException InvalidFloatException

Parameters

• str: String to be processed
  • separators: String with separator characters (default: " \

std::string next_string()

Retrieve next token

Return string with next token

tagint next_tagint()

Retrieve next token and convert to tagint

Return value of next token

bigint next_bigint()

Retrieve next token and convert to bigint

Return value of next token

int next_int()

Retrieve next token and convert to int

Return value of next token

double next_double()

Retrieve next token and convert to double

Return value of next token

bool has_next () const

Indicate whether more tokens are available

Return true if there are more tokens, false if not

bool contains(const std::string &value) const

Search the text to be processed for a sub-string.

Return true if string was found, false if not

Parameters

  • value: string with value to be searched for
void **skip** (int *ntokens*)

Skip over a given number of tokens

**Parameters**

- *n*: number of tokens to skip over

`sizet count ()`

Count number of tokens in text.

**Return** number of counted tokens

---

```cpp
class InvalidIntegerException : public TokenizerException
class InvalidFloatException : public TokenizerException
```

---

### 16.8 File reader classes

The purpose of the file reader classes is to simplify the recurring task of reading and parsing files. They can use the `LAMMPS_NS::ValueTokenizer` class to process the read in text. The `LAMMPS_NS::TextFileReader` is a more general version while `LAMMPS_NS::PotentialFileReader` is specialized to implement the behavior expected for looking up and reading/parsing files with potential parameters in LAMMPS. The potential file reader class requires a LAMMPS instance, requires to be run on MPI rank 0 only, will use the `LAMMPS_NS::utils::get_potential_file_path()` function to look up and open the file, and will call the `LAMMPS_NS::Error` class in case of failures to read or to convert numbers, so that LAMMPS will be aborted.

Listing 5: Use of PotentialFileReader class in pair style coul/streitz

```cpp
PotentialFileReader reader(lmp, file, "coul/streitz");
char * line;
while((line = reader.next_line(NPARAMS_PER_LINE))) {
    try {
        ValueTokenizer values(line);
        std::string iname = values.next_string();
        int ielement;
        for (ielement = 0; ielement < nelements; ielement++)
            if (iname == elements[ielement]) break;

        if (nparams == maxparam) {
            maxparam += DELTA;
            params = (Param *) memory->srealloc(params,maxparam*sizeof(Param),
                "pair:params");
        }

        params[nparams].ielement = ielement;
        params[nparams].chi = values.next_double();
        params[nparams].eta = values.next_double();
        params[nparams].gamma = values.next_double();
        params[nparams].zeta = values.next_double();
        params[nparams].zcore = values.next_double();
    }
}(continues on next page)
```
class LAMMPS_NS::TextFileReader

Public Functions

TextFileReader(const std::string &filename, const std::string &filetype)

Class for reading and parsing text files

The value of the class member variable ignore_comments controls whether any text following the pound sign (#) should be ignored (true) or not (false). Default: true, i.e. ignore.

See also TextFileReader

Parameters

• filename: Name of file to be read
• filetype: Description of file type for error messages

~TextFileReader()

Closes the file

void skip_line()

Read the next line and ignore it

char *next_line(int nparams = 0)

Read the next line(s) until nparams words have been read.

This reads a line and counts the words in it, if the number is less than the requested number, it will read the next line, as well. Output will be a string with all read lines combined. The purpose is to somewhat replicate the reading behavior of formatted files in Fortran.

If the ignore_comments class member has the value true, then any text read in is truncated at the first ‘#’ character.

Return String with the concatenated text

Parameters
• nparams: Number of words that must be read. Default: 0

void next_dvector (double *list, int n)
Read lines until n doubles have been read and stored in array list
This reads lines from the file using the next_line() function, and splits them into floating-point numbers using the ValueTokenizer class and stores the number is the provided list.

Parameters
• list: Pointer to array with suitable storage for n doubles
• n: Number of doubles to be read

ValueTokenizer next_values (int nparams, const std::string &separators = TOK-
ENIZER_DEFAULT_SEPARATORS)
Read text until nparams words are read and passed to a tokenizer object for custom parsing.
This reads lines from the file using the next_line() function, and splits them into floating-point numbers using the ValueTokenizer class and stores the number is the provided list.

Return ValueTokenizer object for read in text
Parameters
• nparams: Number of words to be read
• separators: String with list of separators.

Public Members

bool ignore_comments
Controls whether comments are ignored.

class LAMMPS_NS::PotentialFileReader: protected Pointers

Public Functions

PotentialFileReader (class LAMMPS *lmp, const std::string &filename, const std::string &potential_name, const int auto_convert = 0)
Class for reading and parsing LAMMPS potential files
The value of the class member variable ignore_comments controls whether any text following the pound sign (#) should be ignored (true) or not (false). Default: true, i.e. ignore.

See also TextFileReader

Parameters
• lmp: Pointer to LAMMPS instance
• filename: Name of file to be read
• potential_name: Name of potential style for error messages
• auto_convert: Bitmask of supported unit conversions

~PotentialFileReader ()
Closes the file
void `ignore_comments` (bool value)
Set comment (= text after `#`) handling preference for the file to be read

Parameters

- value: Comment text is ignored if true, or not if false

tvoid `skip_line`()
Read a line but ignore its content

tchar *`next_line` (int nparams = 0)
Read the next line(s) until `nparams` words have been read.

This reads a line and counts the words in it, if the number is less than the requested number, it will read
the next line, as well. Output will be a string with all read lines combined. The purpose is to somewhat
replicate the reading behavior of formatted files in Fortran.

Return String with the concatenated text

Parameters

- nparams: Number of words that must be read. Default: 0

void `next_dvector` (double *list, int n)
Read lines until `n` doubles have been read and stored in array `list`

This reads lines from the file using the `next_line()` function, and splits them into floating-point numbers
using the ValueTokenizer class and stores the number is the provided list.

Parameters

- list: Pointer to array with suitable storage for `n` doubles
- n: Number of doubles to be read

`ValueTokenizer` `next_values` (int `nparams`, const std::string &`separators` = TOKENIZER_DEFAULT_SEPARATORS)
Read text until `nparams` words are read and passed to a tokenizer object for custom parsing.

This reads lines from the file using the `next_line()` function, and splits them into floating-point numbers
using the ValueTokenizer class and stores the number is the provided list.

Return ValueTokenizer object for read in text

Parameters

- nparams: Number of words to be read
- separators: String with list of separators.

double `next_double`()
Read next line and convert first word to a double

Return Value of first word in line as double

int `next_int`()
Read next line and convert first word to an int

Return Value of first word in line as int

16.8. File reader classes 507
tagint next_tagint ()
   Read next line and convert first word to a tagint

   Return Value of first word in line as tagint

bigint next_bigint ()
   Read next line and convert first word to a bigint

   Return Value of first word in line as bigint

std::string next_string ()
   Read next line and return first word

   Return First word of read in line

16.9 Memory pool classes

The memory pool classes are used for cases where otherwise many small memory allocations would be needed and where the data would be either all used or all freed. One example for that is the storage of neighbor lists. The memory management strategy is based on the assumption that allocations will be in chunks of similar sizes. The allocation is then not done per individual call for a reserved chunk of memory, but for a “page” that can hold multiple chunks of data. A parameter for the maximum chunk size must be provided, as that is used to determine whether a new page of memory must be used.

The MyPage class offers two ways to reserve a chunk: 1) with get() the chunk size needs to be known in advance, 2) with vget() a pointer to the next chunk is returned, but its size is registered later with vgot().

Listing 6: Example of using MyPage

#include "my_page.h"
using namespace LAMMPS_NS;

MyPage<double> *dpage = new MyPage<double>;
   // max size of chunk: 256, size of page: 10240 doubles (=81920 bytes)
dpage->init(256,10240);

double **build_some_lists(int num) {
   dpage->reset();
   double **dlist = new double*[num];
   for (int i=0; i < num; ++i) {
      double *dptr = dpage.vget();
      int jnum = 0;
      for (int j=0; j < jmax; ++j) {
         // compute some dvalue for eligible loop index j
         dptr[j] = dvalue;
         ++jnum;
      }
      if (dpage.status() != 0) {
         // handle out of memory or jnum too large errors
      }
      dpage.vgot(jnum);
      dlist[i] = dptr;
   }
   return dlist;
}

(continues on next page)
template<class T>

class LAMMPS_NS::MyPage

Templated class for storing chunks of datums in pages.

The size of the chunk may vary from call to call, but must be less or equal than the maxchunk setting. The chunks are not returnable like with malloc() (i.e. you cannot call free() on them individually). One can only reset and start over. The purpose of this class is to replace many small memory allocations via malloc() with a few large ones. Since the pages are never freed until the class is re-initialized, they can be re-used without having to re-allocate them by calling the reset() method.

The settings maxchunk, pagesize, and pagedelta control the memory allocation strategy. The maxchunk value represents the expected largest number of items per chunk. If there is less space left on the current page, a new page is allocated for the next chunk. The pagesize value represents how many items can fit on a single page. It should have space for multiple chunks of size maxchunk. The combination of these two parameters determines how much memory is wasted by either switching to the next page too soon or allocating too large pages that never get properly used. It is an error, if a requested chunk is larger than maxchunk. The pagedelta parameter determines how many pages are allocated in one go. In combination with the pagesize setting, this determines how often blocks of memory get allocated (fewer allocations will result in faster execution).

Note This is a template class with explicit instantiation. If the class is used with a new data type a new explicit instantiation may need to be added at the end of the file src/my_page.cpp to avoid symbol lookup errors.

Public Functions

MyPage()

Create a class instance

Need to call init() before use to define allocation settings

int init (int user_maxchunk = 1, int user_pagesize = 1024, int user_pagedelta = 1)

(Re-)initialize the set of pages and allocation parameters.

This also frees all previously allocated storage and allocates the first page(s).

Return 1 if there were invalid parameters, 2 if there was an allocation error or 0 if successful

Parameters

• user_maxchunk: Expected maximum number of items for one chunk
• user_pagesize: Number of items on a single memory page
• user_pagedelta: Number of pages to allocate with one malloc

T *get (int n = 1)

Pointer to location that can store N items.

This will allocate more pages as needed. If the parameter N is larger than the maxchunk setting an error is flagged.
Return memory location or null pointer, if error or allocation failed

Parameters

- \( n \): number of items for which storage is requested

\( T \) *vget()*

Get pointer to location that can store \( \text{maxchunk} \) items.

This will return the same pointer as the previous call to this function unless vgot() is called afterwards to record how many items of the chunk were actually used.

Return pointer to chunk of memory or null pointer if run out of memory

```cpp
void vgot(int n)
```

Mark \( N \) items as used of the chunk reserved with a preceding call to vget().

This will advance the internal pointer inside the current memory page. It is not necessary to call this function for \( N = 0 \), that is the reserved storage was not used. A following call to vget() will then reserve the same location again. It is an error if \( N > \text{maxchunk} \).

Parameters

- \( n \): Number of items used in previously reserved chunk

```cpp
void reset()
```

Reset state of memory pool without freeing any memory

```cpp
double size() const
```

Return total size of allocated pages

Return total storage used in bytes

```cpp
int status() const
```

Return error status

Return 0 if no error, 1 requested chunk size > maxchunk, 2 if malloc failed

```cpp
template<class T>
class LAMMPS_NS::MyPoolChunk
```

Templated class for storing chunks of datums in pages.

The size of the chunk may vary from call to call between the minchunk and maxchunk setting. Chunks may be returned to the pool for re-use. Chunks can be reserved in \( \text{nbin} \) different sizes between minchunk and maxchunk. The chunksperpage setting specifies how many chunks are stored on any page and the pagedelta setting determines how many pages are allocated in one go. Pages are never freed, so they can be re-used without re-allocation.

**Note** This is a template class with explicit instantiation. If the class is used with a new data type a new explicit instantiation may need to be added at the end of the file src/my_pool_chunk.cpp to avoid symbol lookup errors.
Public Functions

MyPoolChunk (int user_minchunk = 1, int user_maxchunk = 1, int user_nbin = 1, int user_chunkperpage = 1024, int user_pagedelta = 1)
Create a class instance and set memory pool parameters

Parameters
- user_minchunk: Minimal chunk size
- user_maxchunk: Maximal chunk size
- user_nbin: Number of bins of different chunk sizes
- user_chunkperpage: Number of chunks per page
- user_pagedelta: Number of pages to allocate in one go

~MyPoolChunk ()
Destroy class instance and free all allocated memory

T *get (int &index)
Return pointer/index of unused chunk of size maxchunk

Return Pointer to requested chunk of storage
Parameters
- index: Index of chunk in memory pool

T *get (int n, int &index)
Return pointer/index of unused chunk of size N

Return Pointer to requested chunk of storage
Parameters
- n: Size of chunk
  - index: Index of chunk in memory pool

void put (int index)
Put indexed chunk back into memory pool via free list

Parameters
- index: Memory chunk index returned by call to get()

double size () const
Return total size of allocated pages

Return total storage used in bytes

int status () const
Return error status

Return 0 if no error, 1 if invalid input, 2 if malloc() failed, 3 if chunk > maxchunk
16.10 Eigensolver functions

The `MathEigen` sub-namespace of the `LAMMPS_NS` namespace contains functions and classes for eigensolvers. Currently only the `jacobi3` function is used in various places in LAMMPS. That function is built on top of a group of more generic eigensolvers that are maintained in the `math_eigen_impl.h` header file. This header contains the implementation of three template classes:

1. “Jacobi” calculates all of the eigenvalues and eigenvectors of a dense, symmetric, real matrix.
2. The “PEigenDense” class only calculates the principal eigenvalue (ie. the largest or smallest eigenvalue), and its corresponding eigenvector. However it is much more efficient than “Jacobi” when applied to large matrices (larger than 13x13). PEigenDense also can understand complex-valued Hermitian matrices.
3. The “LambdaLanczos” class is a generalization of “PEigenDense” which can be applied to arbitrary sparse matrices.

The “math_eigen_impl.h” code is an amalgamation of `jacobi_pd` by Andrew Jewett at Scripps Research (under CC0-1.0 license) and Lambda Lanczos by Yuya Kurebayashi at Tohoku University (under MIT license).

```cpp
int MathEigen::jacobi3 (double const *const *mat, double *eval, double **evec)
    A specialized function which finds the eigenvalues and eigenvectors of a 3x3 matrix (in double ** format).

    Return 0 if eigenvalue calculation converged, 1 if it failed

    Parameters
    • mat: the 3x3 matrix you wish to diagonalize
    • eval: store the eigenvalues here
    • evec: store the eigenvectors here...

int MathEigen::jacobi3 (double const mat[3][3], double *eval, double evec[3][3])
    This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
```

16.11 LAMMPS C++ base classes

LAMMPS is designed to be used as a C++ class library where one can set up and drive a simulation through creating a class instance and then calling some abstract operations or commands on that class or its member class instances. These are interfaced to the C library API, which providing an additional level of abstraction simplification for common operations. The C API is also the basis for calling LAMMPS from Python or Fortran.

When used from a C++ program, most of the symbols and functions in LAMMPS are wrapped into the `LAMMPS_NS` namespace so they will not collide with your own classes or other libraries. This, however, does not extend to the additional libraries bundled with LAMMPS in the lib folder and some of the low-level code of some packages.

Behind the scenes this is implemented through inheritance and polymorphism where base classes define the abstract interface and derived classes provide the specialized implementation for specific models or optimizations or ports to accelerator platforms. This document will provide an outline of the fundamental class hierarchy and some selected examples for derived classes of specific models.

**Note:** Please see the note about thread-safety in the library Howto doc page.
16.11.1 LAMMPS Class

The LAMMPS class is encapsulating an MD simulation state and thus it is the class that needs to be created when starting a new simulation system state. The LAMMPS executable essentially creates one instance of this class and passes the command line flags and tells it to process the provided input (a file or stdin). It shuts the class down when control is returned to it and then exits. When using LAMMPS as a library from another code it is required to create an instance of this class, either directly from C++ with new LAMMPS() or through one of the library interface functions like lammps_open() of the C-library interface, or the lammps.lammps class constructor of the Python module, or the lammps() constructor of the Fortran module.

class LAMMPS_NS::LAMMPS

LAMMPS simulation instance.

The LAMMPS class contains pointers of all constituent class instances and global variables that are used by a LAMMPS simulation. Its contents represent the entire state of the simulation.

The LAMMPS class manages the components of an MD simulation by creating, deleting, and initializing instances of the classes it is composed of, processing command line flags, and providing access to some global properties. The specifics of setting up and running a simulation are handled by the individual component class instances.

Public Functions

const char *match_style(const char *style, const char *name)

Return name of package that a specific style belongs to.

This function checks the given name against all list of styles for all type of styles and if the name and the style match, it returns which package this style belongs to.

Return Name of the package this style is part of

Parameters

• style: Type of style (e.g. atom, pair, fix, etc.)
• name: Name of style

LAMMPS(int, char**, MPI_Comm)

Create a LAMMPS simulation instance

The LAMMPS constructor starts up a simulation by allocating all fundamental classes in the necessary order, parses input switches and their arguments, initializes communicators, screen and logfile output FILE pointers.

Parameters

• nargs: number of arguments
• arg: list of arguments
• communicator: MPI communicator used by this LAMMPS instance

~LAMMPS()

Shut down a LAMMPS simulation instance

The LAMMPS destructor shuts down the simulation by deleting top-level class instances, closing screen and log files for the global instance (aka “world”) and files and MPI communicators in sub-partitions (“universes”). Then it deletes the fundamental class instances and copies of data inside the class.
Public Static Functions

bool is_installed_pkg(const char *pkg)

Return true if a LAMMPS package is enabled in this binary

Parameters
  • pkg: name of package

16.11.2 LAMMPS Atom and AtomVec Base Classes

class LAMMPS_NS::Atom : protected Pointers

Class to provide access to atom data.

The Atom class provides access to atom style related global settings and per-atom data that is stored with atoms and migrates with them from sub-domain to sub-domain as atoms move around. This includes topology data, which is stored with either one specific atom or all atoms involved depending on the settings of the newton command.

The actual per-atom data is allocated and managed by one of the various classes derived from the AtomVec class as determined by the atom_style command. The pointers in the Atom class are updated by the AtomVec class as needed.

Public Functions

Atom(class LAMMPS*)

Atom class constructor

This resets and initialized all kinds of settings, parameters, and pointer variables for per-atom arrays. This also initializes the factory for creating instances of classes derived from the AtomVec base class, which correspond to the selected atom style.

Parameters
  • lmp: pointer to the base LAMMPS class

int add_custom(const char*, int)

Add a custom per-atom property with the given name and type.

This function will add a custom per-atom property with the name “name” as either list of int or double to the list of custom properties. This function is called, e.g. from fix property/atom.

Return Index of property in the respective list of properties

Parameters
  • name: Name of the property (w/o a “d_” or “i_” prefix)
  • flag: Data type of property: 0 for int, 1 for double

void remove_custom(int, int)

Remove a custom per-atom property of a given type.

This will remove a property that was requested e.g. by the fix property/atom command. It frees the allocated memory and sets the pointer to nullptr to the entry in the list can be reused. The lists of those pointers will never be compacted or never shrink, so that index to name mappings remain valid.
Parameters

- **flag**: whether the property is integer (=0) or double (=1)
- **index**: of that property in the respective list.

```cpp
void *extract(const char*)
```

Provide access to internal data of the Atom class by keyword

This function is a way to access internal per-atom data. This data is distributed across MPI ranks and thus only the data for “local” atoms are expected to be available. Whether also data for “ghost” atoms is stored and up-to-date depends on various simulation settings.

This table lists a large part of the supported names, their data types, length of the data area, and a short description.

See also `lammps_extract_atom()`
See *extract_datatype*

**Return** pointer to the requested data cast to `void *` or `nullptr`

**Parameters**

- `name`: string with the keyword of the desired property. Typically the name of the pointer variable returned

```cpp
int extract_datatype(const char*)
```

Provide data type info about internal data of the Atom class

See *extract*

**Return** data type constant for desired property or -1

**Parameters**

- `name`: string with the keyword of the desired property.

```cpp
struct PerAtom
```

### 16.11.3 LAMMPS Input Base Class

**class** LAMMPS_NS::Input : protected `Pointers`

Class for processing commands and input files.

The Input class contains methods for reading, pre-processing and parsing LAMMPS commands and input files and will dispatch commands to the respective class instances or contains the code to execute the commands directly. It also contains the instance of the Variable class which performs computations and text substitutions.

**Public Functions**

**Input (class LAMMPS*, int, char**)**

Input class constructor

This sets up the input processing, processes the `-var` and `-echo` command line flags, holds the factory of commands and creates and initializes an instance of the Variable class.

To execute a command, a specific class instance, derived from `Pointers`, is created, then its `command()` member function executed, and finally the class instance is deleted.

**Parameters**

- `lmp`: pointer to the base `LAMMPS` class
- `argc`: number of entries in `argv`
- `argv`: argument vector

```cpp
void file()
```

Process all input from the `FILE *` pointer `*infile*`
This will read lines from *infile*, parse and execute them until the end of the file is reached. The *infile* pointer will usually point to *stdin* or the input file given with the –in command line flag.

```cpp
void file (const char*)
```

Process all input from the file *filename*

This function opens the file at the path *filename*, put the current file pointer stored in *infile* on a stack and instead assign *infile* with the newly opened file pointer. Then it will call the `Input::file()` function to read, parse and execute the contents of that file. When the end of the file is reached, it is closed and the previous file pointer from the infile file pointer stack restored to *infile*.

**Parameters**

- *filename*: name of file with *LAMMPS* commands

```cpp
char *one (const std::string&)
```

Process a single command from a string in *single*

This function takes the text in *single*, makes a copy, parses that, executes the command and returns the name of the command (without the arguments). If there was no command in *single* it will return `nullptr`.

**Return** string with name of the parsed command w/o arguments

**Parameters**

- *single*: string with *LAMMPS* command
17.1 angle_coeff command

17.1.1 Syntax

\texttt{angle\_coeff \ N \ args}

- \texttt{N = angle type (see asterisk form below)}
- \texttt{args = coefficients for one or more angle types}

17.1.2 Examples

\begin{verbatim}
angle_coeff 1 300.0 107.0
angle_coeff * 5.0
angle_coeff 2*10 5.0
\end{verbatim}

17.1.3 Description

Specify the angle force field coefficients for one or more angle types. The number and meaning of the coefficients depends on the angle style. Angle coefficients can also be set in the data file read by the \texttt{read\_data} command or in a restart file.

\texttt{N} can be specified in one of two ways. An explicit numeric value can be used, as in the first example above. Or a wild-card asterisk can be used to set the coefficients for multiple angle types. This takes the form “\*” or “\*n” or “\*n” or “m\*n”. If \texttt{N} = the number of angle types, then an asterisk with no numeric values means all types from 1 to \texttt{N}. A leading asterisk means all types from 1 to \texttt{n} (inclusive). A trailing asterisk means all types from \texttt{n} to \texttt{N} (inclusive). A middle asterisk means all types from \texttt{m} to \texttt{n} (inclusive).

Note that using an \texttt{angle\_coeff} command can override a previous setting for the same angle type. For example, these commands set the coeffs for all angle types, then overwrite the coeffs for just angle type 2:

\begin{verbatim}
angle_coeff * 200.0 107.0 1.2
angle_coeff 2 50.0 107.0
\end{verbatim}

A line in a data file that specifies angle coefficients uses the exact same format as the arguments of the \texttt{angle\_coeff} command in an input script, except that wild-card asterisks should not be used since coefficients for all \texttt{N} types must be listed in the file. For example, under the “Angle Coeffs” section of a data file, the line that corresponds to the first example above would be listed as
The angle_style class2 is an exception to this rule, in that an additional argument is used in the input script to allow specification of the cross-term coefficients. See its doc page for details.

The list of all angle styles defined in LAMMPS is given on the angle_style doc page. They are also listed in more compact form on the Commands angle doc page.

On either of those pages, click on the style to display the formula it computes and its coefficients as specified by the associated angle_coeff command.

17.1.4 Restrictions

This command must come after the simulation box is defined by a read_data, read_restart, or create_box command. An angle style must be defined before any angle coefficients are set, either in the input script or in a data file.

17.1.5 Related commands

angle_style

17.1.6 Default

none

17.2 angle_style command

17.2.1 Syntax

```
angle_style style
```

- style = none or hybrid or charmm or class2 or cosine or cosine/squared or harmonic

17.2.2 Examples

```
angle_style harmonic
angle_style charmm
angle_style hybrid harmonic cosine
```
17.2.3 Description

Set the formula(s) LAMMPS uses to compute angle interactions between triplets of atoms, which remain in force for the duration of the simulation. The list of angle triplets is read in by a \texttt{read\_data} or \texttt{read\_restart} command from a data or restart file.

Hybrid models where angles are computed using different angle potentials can be setup using the \texttt{hybrid} angle style. The coefficients associated with a angle style can be specified in a data or restart file or via the \texttt{angle\_coeff} command.

All angle potentials store their coefficient data in binary restart files which means angle_style and \texttt{angle\_coeff} commands do not need to be re-specified in an input script that restarts a simulation. See the \texttt{read\_restart} command for details on how to do this. The one exception is that angle_style \texttt{hybrid} only stores the list of sub-styles in the restart file; angle coefficients need to be re-specified.

\textbf{Note:} When both an angle and pair style is defined, the \texttt{special\_bonds} command often needs to be used to turn off (or weight) the pairwise interaction that would otherwise exist between 3 bonded atoms.

In the formulas listed for each angle style, \textit{theta} is the angle between the 3 atoms in the angle.

Here is an alphabetic list of angle styles defined in LAMMPS. Click on the style to display the formula it computes and coefficients specified by the associated \texttt{angle\_coeff} command.

Click on the style to display the formula it computes, any additional arguments specified in the angle_style command, and coefficients specified by the associated \texttt{angle\_coeff} command.

There are also additional accelerated pair styles included in the LAMMPS distribution for faster performance on CPUs, GPUs, andKNLs. The individual style names on the \texttt{Commands angle} doc page are followed by one or more of (g,i,k,o,t) to indicate which accelerated styles exist.

- \texttt{none} - turn off angle interactions
- \texttt{zero} - topology but no interactions
- \texttt{hybrid} - define multiple styles of angle interactions
- \texttt{charmm} - CHARMM angle
- \texttt{class2} - COMPASS (class 2) angle
- \texttt{class2/p6} - COMPASS (class 2) angle expanded to 6th order
- \texttt{cosine} - angle with cosine term
- \texttt{cosine/buck6d} - same as cosine with Buckingham term between 1-3 atoms
- \texttt{cosine/delta} - angle with difference of cosines
- \texttt{cosine/periodic} - DREIDING angle
- \texttt{cosine/shift} - angle cosine with a shift
- \texttt{cosine/shift/exp} - cosine with shift and exponential term in spring constant
- \texttt{cosine/squared} - angle with cosine squared term
- \texttt{cross} - cross term coupling angle and bond lengths
- \texttt{dipole} - angle that controls orientation of a point dipole
- \texttt{fourier} - angle with multiple cosine terms
- \texttt{fourier/simple} - angle with a single cosine term
LAMMPS Documentation

- harmonic - harmonic angle
- mm3 - anharmonic angle
- quartic - angle with cubic and quartic terms
- sdk - harmonic angle with repulsive SDK pair style between 1-3 atoms
- table - tabulated by angle

17.2.4 Restrictions

Angle styles can only be set for atom_styles that allow angles to be defined.

Most angle styles are part of the MOLECULE package. They are only enabled if LAMMPS was built with that package. See the Build package doc page for more info. The doc pages for individual bond potentials tell if it is part of a package.

17.2.5 Related commands

angle_coeff

17.2.6 Default

angle_style none

17.3 atom_modify command

17.3.1 Syntax

atom_modify keyword values ...

- one or more keyword/value pairs may be appended
- keyword = id or map or first or sort
  - id value = yes or no
  - map value = yes or array or hash
  - first value = group-ID = group whose atoms will appear first in internal atom lists
  - sort values = Nfreq binsize
    - Nfreq = sort atoms spatially every this many time steps
    - binsize = bin size for spatial sorting (distance units)
17.3.2 Examples

```
atom_modify map yes
atom_modify map hash sort 10000 2.0
atom_modify first colloid
```

17.3.3 Description

Modify certain attributes of atoms defined and stored within LAMMPS, in addition to what is specified by the `atom_style` command. The `id` and `map` keywords must be specified before a simulation box is defined; other keywords can be specified any time.

The `id` keyword determines whether non-zero atom IDs can be assigned to each atom. If the value is `yes`, which is the default, IDs are assigned, whether you use the `create_atoms` or `read_data` or `read_restart` commands to initialize atoms. If the value is `no` the IDs for all atoms are assumed to be 0.

If atom IDs are used, they must all be positive integers. They should also be unique, though LAMMPS does not check for this. Typically they should also be consecutively numbered (from 1 to `Natoms`), though this is not required. Molecular `atom_style` are those that store bond topology information (styles bond, angle, molecular, full). These styles require atom IDs since the IDs are used to encode the topology. Some other LAMMPS commands also require the use of atom IDs. E.g. some many-body pair styles use them to avoid double computation of the I-J interaction between two atoms.

The only reason not to use atom IDs is if you are running an atomic simulation so large that IDs cannot be uniquely assigned. For a default LAMMPS build this limit is $2^{31}$ or about 2 billion atoms. However, even in this case, you can use 64-bit atom IDs, allowing $2^{63}$ or about 9e18 atoms, if you build LAMMPS with the `-DLAMMPS_BIGBIG` switch. This is described on the `Build_settings` doc page. If atom IDs are not used, they must be specified as 0 for all atoms, e.g. in a data or restart file.

The `map` keyword determines how atoms with specific IDs are found when required. An example are the bond (angle, etc) methods which need to find the local index of an atom with a specific global ID which is a bond (angle, etc) partner. LAMMPS performs this operation efficiently by creating a “map”, which is either an `array` or `hash` table, as described below.

When the `map` keyword is not specified in your input script, LAMMPS only creates a map for `atom_style` for molecular systems which have permanent bonds (angles, etc). No map is created for atomic systems, since it is normally not needed. However some LAMMPS commands require a map, even for atomic systems, and will generate an error if one does not exist. The `map` keyword thus allows you to force the creation of a map. The `yes` value will create either an `array` or `hash` style map, as explained in the next paragraph. The `array` and `hash` values create an atom-style or hash-style map respectively.

For an `array`-style map, each processor stores a lookup table of length N, where N is the largest atom ID in the system. This is a fast, simple method for many simulations, but requires too much memory for large simulations. For a `hash`-style map, a hash table is created on each processor, which finds an atom ID in constant time (independent of the global number of atom IDs). It can be slightly slower than the `array` map, but its memory cost is proportional to the number of atoms owned by a processor, i.e. N/P when N is the total number of atoms in the system and P is the number of processors.

The `first` keyword allows a `group` to be specified whose atoms will be maintained as the first atoms in each processor’s list of owned atoms. This in only useful when the specified group is a small fraction of all the atoms, and there are other operations LAMMPS is performing that will be sped-up significantly by being able to loop over the smaller set of atoms. Otherwise the reordering required by this option will be a net slow-down. The `neigh_modify include` and `comm_modify group` commands are two examples of commands that require this setting to work efficiently. Several `fixes`, most notably time integration fixes like `fix nve`, also take advantage of this setting if the group they operate on is the group specified by this command. Note that specifying “all” as the group-ID effectively turns off the `first` option.
It is OK to use the *first* keyword with a group that has not yet been defined, e.g. to use the atom_modify first command at the beginning of your input script. LAMMPS does not use the group until a simulation is run.

The *sort* keyword turns on a spatial sorting or reordering of atoms within each processor’s sub-domain every \textit{Nfreq} timesteps. If \textit{Nfreq} is set to 0, then sorting is turned off. Sorting can improve cache performance and thus speed-up a LAMMPS simulation, as discussed in a paper by (Meloni). Its efficacy depends on the problem size (atoms/processor), how quickly the system becomes disordered, and various other factors. As a general rule, sorting is typically more effective at speeding up simulations of liquids as opposed to solids. In tests we have done, the speed-up can range from zero to 3-4x.

Reordering is performed every \textit{Nfreq} timesteps during a dynamics run or iterations during a minimization. More precisely, reordering occurs at the first reneighboring that occurs after the target timestep. The reordering is performed locally by each processor, using bins of the specified \textit{binsize}. If \textit{binsize} is set to 0.0, then a binsize equal to half the \textit{neighbor} cutoff distance (force cutoff plus skin distance) is used, which is a reasonable value. After the atoms have been binned, they are reordered so that atoms in the same bin are adjacent to each other in the processor’s 1d list of atoms.

The goal of this procedure is for atoms to put atoms close to each other in the processor’s one-dimensional list of atoms that are also near to each other spatially. This can improve cache performance when pairwise interactions and neighbor lists are computed. Note that if bins are too small, there will be few atoms/bin. Likewise if bins are too large, there will be many atoms/bin. In both cases, the goal of cache locality will be undermined.

\textbf{Note:} Running a simulation with sorting on versus off should not change the simulation results in a statistical sense. However, a different ordering will induce round-off differences, which will lead to diverging trajectories over time when comparing two simulations. Various commands, particularly those which use random numbers (e.g. \textit{velocity create}, and \textit{fix langevin}), may generate (statistically identical) results which depend on the order in which atoms are processed. The order of atoms in a \textit{dump} file will also typically change if sorting is enabled.

17.3.4 Restrictions

The *first* and *sort* options cannot be used together. Since sorting is on by default, it will be turned off if the *first* keyword is used with a group-ID that is not “all”.

17.3.5 Related commands

none

17.3.6 Default

By default, \textit{id} is yes. By default, atomic systems (no bond topology info) do not use a map. For molecular systems (with bond topology info), a map is used. The default map style is array if no atom ID is larger than 1 million, otherwise the default is hash. By default, a “first” group is not defined. By default, sorting is enabled with a frequency of 1000 and a binsize of 0.0, which means the neighbor cutoff will be used to set the bin size. If no neighbor cutoff is defined, sorting will be turned off.

17.4 atom_style command

17.4.1 Syntax

```
atom_style style args
```

- style = angle or atomic or body or bond or charge or dipole or dpd or edpd or electron or ellipsoid or full or line or mdpd or molecular or peri or smd or sph or sphere or spin or tdpd or tri or template or hybrid

Args = none for any style except the following

- body args = bstyle bstyle-args
- bstyle = style of body particles
- bstyle-args = additional arguments specific to the bstyle
  see the Howto body doc
- sphere arg = 0/1 (optional) for static/dynamic particle radii
- tdpd arg = Nspecies
  Nspecies = # of chemical species
- template arg = template-ID
  template-ID = ID of molecule template specified in a separate molecule command
- hybrid args = list of one or more sub-styles, each with their args

- accelerated styles (with same args) = angle/kk or atomic/kk or bond/kk or charge/kk or full/kk or molecular/kk

17.4.2 Examples

```
atom_style atomic
atom_style bond
atom_style full
atom_style body nparticle 2 10
atom_style hybrid charge bond
atom_style hybrid charge body nparticle 2 5
atom_style spin
atom_style template myMols
atom_style tdpd 2
```

17.4.3 Description

Define what style of atoms to use in a simulation. This determines what attributes are associated with the atoms. This command must be used before a simulation is setup via a read_data, read_restart, or create_box command.

Note: Many of the atom styles discussed here are only enabled if LAMMPS was built with a specific package, as listed below in the Restrictions section.

Once a style is assigned, it cannot be changed, so use a style general enough to encompass all attributes. E.g. with style bond, angular terms cannot be used or added later to the model. It is OK to use a style more general than needed, though it may be slightly inefficient.

The choice of style affects what quantities are stored by each atom, what quantities are communicated between processors to enable forces to be computed, and what quantities are listed in the data file read by the read_data command.
These are the additional attributes of each style and the typical kinds of physical systems they are used to model. All styles store coordinates, velocities, atom IDs and types. See the read_data, create_atoms, and set commands for info on how to set these various quantities.

</table>

**Note:** It is possible to add some attributes, such as a molecule ID, to atom styles that do not have them via the fix property/atom command. This command also allows new custom attributes consisting of extra integer or floating-point values to be added to atoms. See the fix property/atom doc page for examples of cases where this is useful and details on how to initialize, access, and output the custom values.

All of the above styles define point particles, except the sphere, ellipsoid, electron, peri, wavepacket, line, tri, and body styles, which define finite-size particles. See the Howto spherical doc page for an overview of using finite-size particle models with LAMMPS.

All of the point-particle styles assign mass to particles on a per-type basis, using the mass command, The finite-size particle styles assign mass to individual particles on a per-particle basis.

For the sphere style, the particles are spheres and each stores a per-particle diameter and mass. If the diameter > 0.0, the particle is a finite-size sphere. If the diameter = 0.0, it is a point particle. Note that by use of the disc keyword with the fix nne/sphere, fix nvt/sphere, fix nph/sphere, fix npt/sphere commands, spheres can be effectively treated as 2d discs for a 2d simulation if desired. See also the set density/disc command. The sphere style takes an optional 0 or 1 argument. A value of 0 means the radius of each sphere is constant for the duration of the simulation. A value of 1 means the radii may vary dynamically during the simulation, e.g. due to use of the fix adapt command.

For the ellipsoid style, the particles are ellipsoids and each stores a flag which indicates whether it is a finite-size ellipsoid or a point particle. If it is an ellipsoid, it also stores a shape vector with the 3 diameters of the ellipsoid and a quaternion 4-vector with its orientation.

For the dipole style, a point dipole is defined for each point particle. Note that if you wish the particles to be finite-size
spheres as in a Stockmayer potential for a dipolar fluid, so that the particles can rotate due to dipole-dipole interactions, then you need to use atom_style hybrid sphere dipole, which will assign both a diameter and dipole moment to each particle.

For the electron style, the particles representing electrons are 3d Gaussians with a specified position and bandwidth or uncertainty in position, which is represented by the eradius = electron size.

For the peri style, the particles are spherical and each stores a per-particle mass and volume.

The dpd style is for dissipative particle dynamics (DPD) particles. Note that it is part of the USER-DPD package, and is not for use with the pair_style dpd or dpd/stat commands, which can simply use atom_style atomic. Atom_style dpd extends DPD particle properties with internal temperature (dpdTheta), internal conductive energy (uCond), internal mechanical energy (uMech), and internal chemical energy (uChem).

The edpd style is for energy-conserving dissipative particle dynamics (eDPD) particles which store a temperature (edpd_temp), and heat capacity(edpd_cv).

The mdpd style is for many-body dissipative particle dynamics (mDPD) particles which store a density (rho) for considering density-dependent many-body interactions.

The tdpd style is for transport dissipative particle dynamics (tDPD) particles which store a set of chemical concentration. An integer “cc_species” is required to specify the number of chemical species involved in a tDPD system.

The sph style is for smoothed particle hydrodynamics (SPH) particles which store a density (rho), energy (esph), and heat capacity (cv).

The smd style is for a general formulation of Smooth Particle Hydrodynamics. Both fluids and solids can be modeled. Particles store the mass and volume of an integration point, a kernel diameter used for calculating the field variables (e.g. stress and deformation) and a contact radius for calculating repulsive forces which prevent individual physical bodies from penetrating each other.

For the spin style, a magnetic spin is associated to each atom. Those spins have a norm (their magnetic moment) and a direction.

The wavepacket style is similar to electron, but the electrons may consist of several Gaussian wave packets, summed up with coefficients cs= (cs_re,cs_im). Each of the wave packets is treated as a separate particle in LAMMPS, wave packets belonging to the same electron must have identical etag values.

For the line style, the particles are idealized line segments and each stores a per-particle mass and length and orientation (i.e. the end points of the line segment).

For the tri style, the particles are planar triangles and each stores a per-particle mass and size and orientation (i.e. the corner points of the triangle).

The template style allows molecular topology (bonds, angles, etc) to be defined via a molecule template using the molecule command. The template stores one or more molecules with a single copy of the topology info (bonds, angles, etc) of each. Individual atoms only store a template index and template atom to identify which molecule and which atom-within-the-molecule they represent. Using the template style instead of the bond, angle, molecular styles can save memory for systems comprised of a large number of small molecules, all of a single type (or small number of types). See the paper by Grime and Voth, in (Grime), for examples of how this can be advantageous for large-scale coarse-grained systems.

Note: When using the template style with a molecule template that contains multiple molecules, you should insure the atom types, bond types, angle_types, etc in all the molecules are consistent. E.g. if one molecule represents H2O and another CO2, then you probably do not want each molecule file to define 2 atom types and a single bond type, because they will conflict with each other when a mixture system of H2O and CO2 molecules is defined, e.g. by the read_data command. Rather the H2O molecule should define atom types 1 and 2, and bond type 1. And the CO2 molecule should define atom types 3 and 4 (or atom types 3 and 2 if a single oxygen type is desired), and bond type 2.
For the *body* style, the particles are arbitrary bodies with internal attributes defined by the “style” of the bodies, which is specified by the *bstyle* argument. Body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc.

The *Howto body* doc page describes the body styles LAMMPS currently supports, and provides more details as to the kind of body particles they represent. For all styles, each body particle stores moments of inertia and a quaternion 4-vector, so that its orientation and position can be time integrated due to forces and torques.

Note that there may be additional arguments required along with the *bstyle* specification, in the atom_style body command. These arguments are described on the *Howto body* doc page.

Typically, simulations require only a single (non-hybrid) atom style. If some atoms in the simulation do not have all the properties defined by a particular style, use the simplest style that defines all the needed properties by any atom. For example, if some atoms in a simulation are charged, but others are not, use the *charge* style. If some atoms have bonds, but others do not, use the *bond* style.

The only scenario where the *hybrid* style is needed is if there is no single style which defines all needed properties of all atoms. For example, as mentioned above, if you want dipolar particles which will rotate due to torque, you need to use “atom_style hybrid sphere dipole”. When a hybrid style is used, atoms store and communicate the union of all quantities implied by the individual styles.

When using the *hybrid* style, you cannot combine the *template* style with another molecular style that stores bond,angle,etc info on a per-atom basis.

LAMMPS can be extended with new atom styles as well as new body styles; see the *Modify* doc page.

Styles with a *kk* suffix are functionally the same as the corresponding style without the suffix. They have been optimized to run faster, depending on your available hardware, as discussed in on the *Speed packages* doc page. The accelerated styles take the same arguments and should produce the same results, except for round-off and precision issues.

Note that other acceleration packages in LAMMPS, specifically the GPU, USER-INTEL, USER-OMP, and OPT packages do not use accelerated atom styles.

The accelerated styles are part of the KOKKOS package. They are only enabled if LAMMPS was built with those packages. See the *Build package* doc page for more info.

You can specify the accelerated styles explicitly in your input script by including their suffix, or you can use the *-suffix command-line switch* when you invoke LAMMPS, or you can use the *suffix* command in your input script.

See the *Speed packages* doc page for more instructions on how to use the accelerated styles effectively.

**17.4.4 Restrictions**

This command cannot be used after the simulation box is defined by a *read_data* or *create_box* command.

Many of the styles listed above are only enabled if LAMMPS was built with a specific package, as listed below. See the *Build package* doc page for more info.

The *angle*, *bond*, *full*, *molecular*, and *template* styles are part of the MOLECULE package.

The *line* and *tri* styles are part of the ASPHERE package.

The *body* style is part of the BODY package.

The *dipole* style is part of the DIPOLE package.

The *peri* style is part of the PERI package for Peridynamics.
The \textit{electron} style is part of the USER-EFF package for \textit{electronic force fields}.

The \textit{dpd} style is part of the USER-DPD package for dissipative particle dynamics (DPD).

The \textit{edpd, mdpd,} and \textit{tdpd} styles are part of the USER-MESODPD package for energy-conserving dissipative particle dynamics (eDPD), many-body dissipative particle dynamics (mDPD), and transport dissipative particle dynamics (tDPD), respectively.

The \textit{sph} style is part of the USER-SPH package for smoothed particle hydrodynamics (SPH). See this PDF guide to using SPH in LAMMPS.

The \textit{mesont} style is part of the USER-MESONT package.

The \textit{spin} style is part of the SPIN package.

The \textit{wavepacket} style is part of the USER-AWPMD package for the \textit{antisymmetrized wave packet MD method}.

\subsection*{17.4.5 Related commands}

\textit{read_data, pair_style}

\subsection*{17.4.6 Default}

The default atom style is atomic. If atom\_style sphere is used its default argument is 0.

\section*{17.5 balance command}

\subsection*{17.5.1 Syntax}

\begin{verbatim}
balance thresh style args ... keyword args ...
\end{verbatim}

- \texttt{thresh} = imbalance threshold that must be exceeded to perform a re-balance
- one style/arg pair can be used (or multiple for \texttt{x}, \texttt{y}, \texttt{z})
- \texttt{style} = \texttt{x} or \texttt{y} or \texttt{z} or \texttt{shift} or \texttt{rcb}

\begin{verbatim}
x args = \textit{uniform} or \textit{Px-1} numbers between 0 and 1
  \textit{uniform} = evenly spaced cuts between processors in \texttt{x} dimension
  \texttt{x} can be specified together with \texttt{y} or \texttt{z}

y args = \textit{uniform} or \textit{Py-1} numbers between 0 and 1
  \textit{uniform} = evenly spaced cuts between processors in \texttt{y} dimension
  \texttt{y} can be specified together with \texttt{x} or \texttt{z}

z args = \textit{uniform} or \textit{Pz-1} numbers between 0 and 1
  \textit{uniform} = evenly spaced cuts between processors in \texttt{z} dimension
\end{verbatim}
z can be specified together with x or y
shift args = dimstr Niter stopthresh
  dimstr = sequence of letters containing "x" or "y" or "z", each not more than once
  Niter = # of times to iterate within each dimension of dimstr sequence
  stopthresh = stop balancing when this imbalance threshold is reached
rcb args = none

• zero or more keyword/arg pairs may be appended
• keyword = weight or out

weight style args = use weighted particle counts for the balancing
  style = group or neigh or time or var or store
  group args = Ngroup group1 weight1 group2 weight2 ...
    Ngroup = number of groups with assigned weights
    group1, group2, ... = group IDs
    weight1, weight2, ... = corresponding weight factors
  neigh factor = compute weight based on number of neighbors
    factor = scaling factor (> 0)
  time factor = compute weight based on time spend computing
    factor = scaling factor (> 0)
  var name = take weight from atom-style variable
    name = name of the atom-style variable
  store name = store weight in custom atom property defined by fix
    name = atom property name (without d_ prefix)
  out arg = filename
    filename = write each processor's sub-domain to a file

17.5.2 Examples

\begin{verbatim}
balance 0.9 x uniform y 0.4 0.5 0.6
balance 1.2 shift xz 5 1.1
balance 1.0 shift xz 5 1.1
balance 1.1 rcb
balance 1.0 shift x 10 1.1 weight group 2 fast 0.5 slow 2.0
balance 1.0 shift x 10 1.1 weight time 0.8 weight neigh 0.5 weight store balance
balance 1.0 shift x 20 1.0 out tmp.balance
\end{verbatim}

17.5.3 Description

This command adjusts the size and shape of processor sub-domains within the simulation box, to attempt to balance the number of atoms or particles and thus indirectly the computational cost (load) more evenly across processors. The load balancing is “static” in the sense that this command performs the balancing once, before or between simulations. The processor sub-domains will then remain static during the subsequent run. To perform “dynamic” balancing, see the fix balance command, which can adjust processor sub-domain sizes and shapes on-the-fly during a run.

Load-balancing is typically most useful if the particles in the simulation box have a spatially-varying density distribution or when the computational cost varies significantly between different particles. E.g. a model of a vapor/liquid interface, or a solid with an irregular-shaped geometry containing void regions, or hybrid pair style simulations which combine pair styles with different computational cost. In these cases, the LAMMPS default of dividing the simulation box volume into a regular-spaced grid of 3d bricks, with one equal-volume sub-domain per processor, may assign
numbers of particles per processor in a way that the computational effort varies significantly. This can lead to poor performance when the simulation is run in parallel.

The balancing can be performed with or without per-particle weighting. With no weighting, the balancing attempts to assign an equal number of particles to each processor. With weighting, the balancing attempts to assign an equal aggregate computational weight to each processor, which typically induces a different number of atoms assigned to each processor. Details on the various weighting options and examples for how they can be used are given below.

Note that the `processors` command allows some control over how the box volume is split across processors. Specifically, for a Px by Py by Pz grid of processors, it allows choice of Px, Py, and Pz, subject to the constraint that Px * Py * Pz = P, the total number of processors. This is sufficient to achieve good load-balance for some problems on some processor counts. However, all the processor sub-domains will still have the same shape and same volume.

The requested load-balancing operation is only performed if the current “imbalance factor” in particles owned by each processor exceeds the specified `thresh` parameter. The imbalance factor is defined as the maximum number of particles (or weight) owned by any processor, divided by the average number of particles (or weight) per processor. Thus an imbalance factor of 1.0 is perfect balance.

As an example, for 10000 particles running on 10 processors, if the most heavily loaded processor has 1200 particles, then the factor is 1.2, meaning there is a 20% imbalance. Note that a re-balance can be forced even if the current balance is perfect (1.0) by specifying a `thresh < 1.0`.

Note: Balancing is performed even if the imbalance factor does not exceed the `thresh` parameter if a “grid” style is specified when the current partitioning is “tiled”. The meaning of “grid” vs “tiled” is explained below. This is to allow forcing of the partitioning to “grid” so that the `comm_style brick` command can then be used to replace a current `comm_style tiled` setting.

When the balance command completes, it prints statistics about the result, including the change in the imbalance factor and the change in the maximum number of particles on any processor. For “grid” methods (defined below) that create a logical 3d grid of processors, the positions of all cutting planes in each of the 3 dimensions (as fractions of the box length) are also printed.

Note: This command attempts to minimize the imbalance factor, as defined above. But depending on the method a perfect balance (1.0) may not be achieved. For example, “grid” methods (defined below) that create a logical 3d grid cannot achieve perfect balance for many irregular distributions of particles. Likewise, if a portion of the system is a perfect lattice, e.g. the initial system is generated by the `create_atoms` command, then “grid” methods may be unable to achieve exact balance. This is because entire lattice planes will be owned or not owned by a single processor.

Note: The imbalance factor is also an estimate of the maximum speed-up you can hope to achieve by running a perfectly balanced simulation versus an imbalanced one. In the example above, the 10000 particle simulation could run up to 20% faster if it were perfectly balanced, versus when imbalanced. However, computational cost is not strictly proportional to particle count, and changing the relative size and shape of processor sub-domains may lead to additional computational and communication overheads, e.g. in the PPPM solver used via the `kspace_style` command. Thus you should benchmark the run times of a simulation before and after balancing.

The method used to perform a load balance is specified by one of the listed styles (or more in the case of x,y,z), which are described in detail below. There are 2 kinds of styles.

The x, y, z, and shift styles are “grid” methods which produce a logical 3d grid of processors. They operate by changing the cutting planes (or lines) between processors in 3d (or 2d), to adjust the volume (area in 2d) assigned to each processor, as in the following 2d diagram where processor sub-domains are shown and particles are colored by the processor that owns them.
The leftmost diagram is the default partitioning of the simulation box across processors (one sub-box for each of 16 processors); the middle diagram is after a “grid” method has been applied. The \textit{rcb} style is a “tiling” method which does not produce a logical 3d grid of processors. Rather it tiles the simulation domain with rectangular sub-boxes of varying size and shape in an irregular fashion so as to have equal numbers of particles (or weight) in each sub-box, as in the rightmost diagram above.

The “grid” methods can be used with either of the \textit{comm_style} command options, \textit{brick} or \textit{tiled}. The “tiling” methods can only be used with \textit{comm_style tiled}. Note that it can be useful to use a “grid” method with \textit{comm_style tiled} to return the domain partitioning to a logical 3d grid of processors so that “\textit{comm_style brick}” can afterwards be specified for subsequent \textit{run} commands.

When a “grid” method is specified, the current domain partitioning can be either a logical 3d grid or a tiled partitioning. In the former case, the current logical 3d grid is used as a starting point and changes are made to improve the imbalance factor. In the latter case, the tiled partitioning is discarded and a logical 3d grid is created with uniform spacing in all dimensions. This becomes the starting point for the balancing operation.

When a “tiling” method is specified, the current domain partitioning (“grid” or “tiled”) is ignored, and a new partitioning is computed from scratch.

The \textit{x}, \textit{y}, and \textit{z} styles invoke a “grid” method for balancing, as described above. Note that any or all of these 3 styles can be specified together, one after the other, but they cannot be used with any other style. This style adjusts the position of cutting planes between processor sub-domains in specific dimensions. Only the specified dimensions are altered.

The \textit{uniform} argument spaces the planes evenly, as in the left diagrams above. The \textit{numeric} argument requires listing Ps-1 numbers that specify the position of the cutting planes. This requires knowing Ps = Px or Py or Pz = the number of processors assigned by LAMMPS to the relevant dimension. This assignment is made (and the Px, Py, Pz values printed out) when the simulation box is created by the “create box” or “read data” or “read restart” command and is influenced by the settings of the \textit{processors} command.

Each of the numeric values must be between 0 and 1, and they must be listed in ascending order. They represent the fractional position of the cutting place. The left (or lower) edge of the box is 0.0, and the right (or upper) edge is 1.0. Neither of these values is specified. Only the interior Ps-1 positions are specified. Thus is there are 2 processors in the x dimension, you specify a single value such as 0.75, which would make the left processor’s sub-domain 3x larger than the right processor’s sub-domain.

The \textit{shift} style invokes a “grid” method for balancing, as described above. It changes the positions of cutting planes between processors in an iterative fashion, seeking to reduce the imbalance factor, similar to how the \textit{fix balance shift} command operates.
The \textit{dimstr} argument is a string of characters, each of which must be an “x” or “y” or “z”. Each character can appear zero or one time, since there is no advantage to balancing on a dimension more than once. You should normally only list dimensions where you expect there to be a density variation in the particles.

Balancing proceeds by adjusting the cutting planes in each of the dimensions listed in \textit{dimstr}, one dimension at a time. For a single dimension, the balancing operation (described below) is iterated on up to \textit{Niter} times. After each dimension finishes, the imbalance factor is re-computed, and the balancing operation halts if the \textit{stopthresh} criterion is met.

A re-balance operation in a single dimension is performed using a recursive multisectoning algorithm, where the position of each cutting plane (line in 2d) in the dimension is adjusted independently. This is similar to a recursive bisectioning for a single value, except that the bounds used for each bisectioning take advantage of information from neighboring cuts if possible. At each iteration, the count of particles on either side of each plane is tallied. If the counts do not match the target value for the plane, the position of the cut is adjusted to be halfway between a low and high bound. The low and high bounds are adjusted on each iteration, using new count information, so that they become closer together over time. Thus as the recursion progresses, the count of particles on either side of the plane gets closer to the target value.

Once the re-balancing is complete and final processor sub-domains assigned, particles are migrated to their new owning processor, and the balance procedure ends.

\smallskip
\textbf{Note:} At each re-balance operation, the bisectioning for each cutting plane (line in 2d) typically starts with low and high bounds separated by the extent of a processor’s sub-domain in one dimension. The size of this bracketing region shrinks by $\frac{1}{2}$ every iteration. Thus if \textit{Niter} is specified as 10, the cutting plane will typically be positioned to 1 part in 1000 accuracy (relative to the perfect target position). For \textit{Niter} = 20, it will be accurate to 1 part in a million. Thus there is no need to set \textit{Niter} to a large value. LAMMPS will check if the threshold accuracy is reached (in a dimension) is less iterations than \textit{Niter} and exit early. However, \textit{Niter} should also not be set too small, since it will take roughly the same number of iterations to converge even if the cutting plane is initially close to the target value.

The \textit{rcb} style invokes a “tiled” method for balancing, as described above. It performs a recursive coordinate bisectioning (RCB) of the simulation domain. The basic idea is as follows.

The simulation domain is cut into 2 boxes by an axis-aligned cut in one of the dimensions, leaving one new sub-box on either side of the cut. Which dimension is chosen for the cut depends on the particle (weight) distribution within the parent box. Normally the longest dimension of the box is cut, but if all (or most) of the particles are at one end of the box, a cut may be performed in another dimension to induce sub-boxes that are more cube-ish (3d) or square-ish (2d) in shape.

After the cut is made, all the processors are also partitioned into 2 groups, half assigned to the box on the lower side of the cut, and half to the box on the upper side. (If the processor count is odd, one side gets an extra processor.) The cut is positioned so that the number of (weighted) particles in the lower box is exactly the number that the processors assigned to that box should own for load balance to be perfect. This also makes load balance for the upper box perfect. The positioning of the cut is done iteratively, by a bisectioning method (median search). Note that counting particles on either side of the cut requires communication between all processors at each iteration.

That is the procedure for the first cut. Subsequent cuts are made recursively, in exactly the same manner. The subset of processors assigned to each box make a new cut in one dimension of that box, splitting the box, the subset of processors, and the particles in the box in two. The recursion continues until every processor is assigned a sub-box of the entire simulation domain, and owns the (weighted) particles in that sub-box.

This sub-section describes how to perform weighted load balancing using the \textit{weight} keyword.

By default, all particles have a weight of 1.0, which means each particle is assumed to require the same amount of computation during a timestep. There are, however, scenarios where this is not a good assumption. Measuring
the computational cost for each particle accurately would be impractical and slow down the computation. Instead
the weight keyword implements several ways to influence the per-particle weights empirically by properties readily
available or using the user’s knowledge of the system. Note that the absolute value of the weights are not important;
only their relative ratios affect which particle is assigned to which processor. A particle with a weight of 2.5 is assumed
to require 5x more computational than a particle with a weight of 0.5. For all the options below the weight assigned to
a particle must be a positive value; an error will be generated if a weight is <= 0.0.

Below is a list of possible weight options with a short description of their usage and some example scenarios where
they might be applicable. It is possible to apply multiple weight flags and the weightings they induce will be combined
through multiplication. Most of the time, however, it is sufficient to use just one method.

The group weight style assigns weight factors to specified groups of particles. The group style keyword is followed
by the number of groups, then pairs of group IDs and the corresponding weight factor. If a particle belongs to none
of the specified groups, its weight is not changed. If it belongs to multiple groups, its weight is the product of the weight
factors.

This weight style is useful in combination with pair style hybrid, e.g. when combining a more costly many-body
potential with a fast pair-wise potential. It is also useful when using run style respa where some portions of the
system have many bonded interactions and others none. It assumes that the computational cost for each group remains
constant over time. This is a purely empirical weighting, so a series test runs to tune the assigned weight factors for
optimal performance is recommended.

The neigh weight style assigns the same weight to each particle owned by a processor based on the total count of
neighbors in the neighbor list owned by that processor. The motivation is that more neighbors means a higher com-
putational cost. The style does not use neighbors per atom to assign a unique weight to each atom, because that value
can vary depending on how the neighbor list is built.

The factor setting is applied as an overall scale factor to the neigh weights which allows adjustment of their impact
on the balancing operation. The specified factor value must be positive. A value > 1.0 will increase the weights so
that the ratio of max weight to min weight increases by factor. A value < 1.0 will decrease the weights so that the
ratio of max weight to min weight decreases by factor. In both cases the intermediate weight values increase/decrease
proportionally as well. A value = 1.0 has no effect on the neigh weights. As a rule of thumb, we have found a factor
of about 0.8 often results in the best performance, since the number of neighbors is likely to overestimate the ideal
weight.

This weight style is useful for systems where there are different cutoffs used for different pairs of interactions, or the
density fluctuates, or a large number of particles are in the vicinity of a wall, or a combination of these effects. If a
simulation uses multiple neighbor lists, this weight style will use the first suitable neighbor list it finds. It will not
request or compute a new list. A warning will be issued if there is no suitable neighbor list available or if it is not
current, e.g. if the balance command is used before a run or minimize command is used, in which case the neighbor
list may not yet have been built. In this case no weights are computed. Inserting a run 0 post no command before
issuing the balance command, may be a workaround for this case, as it will induce the neighbor list to be built.

The time weight style uses timer data to estimate weights. It assigns the same weight to each particle owned by a
processor based on the total computational time spent by that processor. See details below on what time window is
used. It uses the same timing information as is used for the MPI task timing breakdown, namely, for sections Pair,
Bond, Kspace, and Neigh. The time spent in those portions of the timestep are measured for each MPI rank, summed,
then divided by the number of particles owned by that processor. I.e. the weight is an effective CPU time/particle
averaged over the particles on that processor.

The factor setting is applied as an overall scale factor to the time weights which allows adjustment of their impact
on the balancing operation. The specified factor value must be positive. A value > 1.0 will increase the weights so
that the ratio of max weight to min weight increases by factor. A value < 1.0 will decrease the weights so that the
ratio of max weight to min weight decreases by factor. In both cases the intermediate weight values increase/decrease
proportionally as well. A value = 1.0 has no effect on the time weights. As a rule of thumb, effective values to use
are typically between 0.5 and 1.2. Note that the timer quantities mentioned above can be affected by communication
which occurs in the middle of the operations, e.g. pair styles with intermediate exchange of data within the force
computation, and likewise for KSpace solves.
When using the *time* weight style with the *balance* command, the timing data is taken from the preceding run command, i.e. the timings are for the entire previous run. For the *fix balance* command the timing data is for only the timesteps since the last balancing operation was performed. If timing information for the required sections is not available, e.g. at the beginning of a run, or when the *timer* command is set to either *loop* or *off*, a warning is issued. In this case no weights are computed.

**Note:** The *time* weight style is the most generic option, and should be tried first, unless the *group* style is easily applicable. However, since the computed cost function is averaged over all particles on a processor, the weights may not be highly accurate. This style can also be effective as a secondary weight in combination with either *group* or *neigh* to offset some of inaccuracies in either of those heuristics.

The *var* weight style assigns per-particle weights by evaluating an *atom-style variable* specified by *name*. This is provided as a more flexible alternative to the *group* weight style, allowing definition of a more complex heuristics based on information (global and per atom) available inside of LAMMPS. For example, atom-style variables can reference the position of a particle, its velocity, the volume of its Voronoi cell, etc.

The *store* weight style does not compute a weight factor. Instead it stores the current accumulated weights in a custom per-atom property specified by *name*. This must be a property defined as *d_name* via the *fix property/atom* command. Note that these custom per-atom properties can be output in a *dump* file, so this is a way to examine, debug, or visualize the per-particle weights computed during the load-balancing operation.

The *out* keyword writes a text file to the specified *filename* with the results of the balancing operation. The file contains the bounds of the sub-domain for each processor after the balancing operation completes. The format of the file is compatible with the *Pizza.py mdump* tool which has support for manipulating and visualizing mesh files. An example is shown here for a balancing by 4 processors for a 2d problem:

```
ITEM: TIMESTEP
0
ITEM: NUMBER OF NODES
16
ITEM: BOX BOUNDS
 0 10
 0 10
 0 10
ITEM: NODES
 1 1 0 0 0
 2 1 5 0 0
 3 1 5 5 0
 4 1 0 5 0
 5 1 5 0 0
 6 1 10 0 0
 7 1 10 5 0
 8 1 5 5 0
 9 1 0 5 0
10 1 5 5 0
11 1 5 10 0
12 1 10 5 0
13 1 5 5 0
14 1 10 5 0
15 1 10 10 0
16 1 5 10 0
ITEM: TIMESTEP
0
ITEM: NUMBER OF SQUARES
(continues on next page)```
The coordinates of all the vertices are listed in the NODES section, 5 per processor. Note that the 4 sub-domains share vertices, so there will be duplicate nodes in the list.

The “SQUARES” section lists the node IDs of the 4 vertices in a rectangle for each processor (1 to 4).

For a 3d problem, the syntax is similar with 8 vertices listed for each processor, instead of 4, and “SQUARES” replaced by “CUBES”.

17.5.4 Restrictions

For 2d simulations, the z style cannot be used. Nor can a “z” appear in dimstr for the shift style.

Balancing through recursive bisectioning (rcb style) requires comm_style tiled

17.5.5 Related commands

group, processors, fix balance, comm_style

17.5.6 Default

none

17.6 bond_coeff command

17.6.1 Syntax

\texttt{bond\_coeff} \ N \ \texttt{args}

\begin{itemize}
  \item N = bond type (see asterisk form below)
  \item args = coefficients for one or more bond types
\end{itemize}
17.6.2 Examples

```
bond_coeff 5 80.0 1.2
bond_coeff * 30.0 1.5 1.0 1.0
bond_coeff 1*4 30.0 1.5 1.0 1.0
bond_coeff 1 harmonic 200.0 1.0
```

17.6.3 Description

Specify the bond force field coefficients for one or more bond types. The number and meaning of the coefficients
depends on the bond style. Bond coefficients can also be set in the data file read by the `read_data` command or in a
restart file.

N can be specified in one of two ways. An explicit numeric value can be used, as in the first example above. Or a
wild-card asterisk can be used to set the coefficients for multiple bond types. This takes the form “*” or “*n” or “n*”
or “m*n”. If N = the number of bond types, then an asterisk with no numeric values means all types from 1 to N. A
leading asterisk means all types from 1 to n (inclusive). A trailing asterisk means all types from n to N (inclusive). A
middle asterisk means all types from m to n (inclusive).

Note that using a bond_coeff command can override a previous setting for the same bond type. For example, these
commands set the coeffs for all bond types, then overwrite the coeffs for just bond type 2:

```
bond_coeff * 100.0 1.2
bond_coeff 2 200.0 1.2
```

A line in a data file that specifies bond coefficients uses the exact same format as the arguments of the bond_coeff
command in an input script, except that wild-card asterisks should not be used since coefficients for all N types must
be listed in the file. For example, under the “Bond Coeffs” section of a data file, the line that corresponds to the first
example above would be listed as

```
5 80.0 1.2
```

The list of all bond styles defined in LAMMPS is given on the `bond_style` doc page. They are also listed in more
compact form on the `Commands bond` doc page.

On either of those pages, click on the style to display the formula it computes and its coefficients as specified by the
associated bond_coeff command.

17.6.4 Restrictions

This command must come after the simulation box is defined by a `read_data`, `read_restart`, or `create_box` command.
A bond style must be defined before any bond coefficients are set, either in the input script or in a data file.
17.6.5 Related commands

*bond_style*

17.6.6 Default

bond_style style args
```

- style = none or hybrid or class2 or fene or fene/expand or harmonic or morse or nonlinear or quartic
- args = none for any style except hybrid
  - hybrid args = list of one or more styles

17.7.2 Examples

```plaintext
bond_style harmonic
bond_style fene
bond_style hybrid harmonic fene
```

17.7.3 Description

Set the formula(s) LAMMPS uses to compute bond interactions between pairs of atoms. In LAMMPS, a bond differs from a pairwise interaction, which are set via the *pair_style* command. Bonds are defined between specified pairs of atoms and remain in force for the duration of the simulation (unless the bond breaks which is possible in some bond potentials). The list of bonded atoms is read in by a *read_data* or *read_restart* command from a data or restart file. By contrast, pair potentials are typically defined between all pairs of atoms within a cutoff distance and the set of active interactions changes over time.

Hybrid models where bonds are computed using different bond potentials can be setup using the *hybrid* bond style.

The coefficients associated with a bond style can be specified in a data or restart file or via the *bond_coeff* command. All bond potentials store their coefficient data in binary restart files which means bond_style and *bond_coeff* commands do not need to be re-specified in an input script that restarts a simulation. See the *read_restart* command for details on how to do this. The one exception is that bond_style *hybrid* only stores the list of sub-styles in the restart file; bond coefficients need to be re-specified.

**Note:** When both a bond and pair style is defined, the *special_bonds* command often needs to be used to turn off (or weight) the pairwise interaction that would otherwise exist between 2 bonded atoms.

In the formulas listed for each bond style, \( r \) is the distance between the 2 atoms in the bond.
Here is an alphabetic list of bond styles defined in LAMMPS. Click on the style to display the formula it computes and coefficients specified by the associated `bond_coeff` command.

Click on the style to display the formula it computes, any additional arguments specified in the bond_style command, and coefficients specified by the associated `bond_coeff` command.

There are also additional accelerated pair styles included in the LAMMPS distribution for faster performance on CPUs, GPUs, and KNLs. The individual style names on the `Commands bond` doc page are followed by one or more of (g,i,k,o,t) to indicate which accelerated styles exist.

- **none** - turn off bonded interactions
- **zero** - topology but no interactions
- **hybrid** - define multiple styles of bond interactions
- **class2** - COMPASS (class 2) bond
- **fene** - FENE (finite-extensible non-linear elastic) bond
- **fene/expand** - FENE bonds with variable size particles
- **gromos** - GROMOS force field bond
- **harmonic** - harmonic bond
- **harmonic/shift** - shifted harmonic bond
- **harmonic/shift/cut** - shifted harmonic bond with a cutoff
- **mm3** - MM3 anharmonic bond
- **morse** - Morse bond
- **nonlinear** - nonlinear bond
- **oxdna/fene** - modified FENE bond suitable for DNA modeling
- **oxdna2/fene** - same as oxdna but used with different pair styles
- **oxrna2/fene** - modified FENE bond suitable for RNA modeling
- **quartic** - breakable quartic bond
- **special** - enable special bond exclusions for 1-5 pairs and beyond
- **table** - tabulated by bond length

### 17.7.4 Restrictions

Bond styles can only be set for atom styles that allow bonds to be defined.

Most bond styles are part of the MOLECULE package. They are only enabled if LAMMPS was built with that package. See the `Build package` doc page for more info. The doc pages for individual bond potentials tell if it is part of a package.

17.8 bond_write command

17.8.1 Syntax

```
bond_write btype N inner outer file keyword itype jtype
```

- `btype` = bond types
- `N` = # of values
- `inner,outer` = inner and outer bond length (distance units)
- `file` = name of file to write values to
- `keyword` = section name in file for this set of tabulated values
- `itype,jtype` = 2 atom types (optional)

17.8.2 Examples

```
bond_write 1 500 0.5 3.5 table.txt Harmonic_1
bond_write 3 1000 0.1 6.0 table.txt Morse
```

17.8.3 Description

Write energy and force values to a file as a function of distance for the currently defined bond potential. This is useful for plotting the potential function or otherwise debugging its values. If the file already exists, the table of values is appended to the end of the file to allow multiple tables of energy and force to be included in one file.

The energy and force values are computed at distances from inner to outer for 2 interacting atoms forming a bond of type `btype`, using the appropriate `bond_coeff` coefficients. N evenly spaced distances are used.

For example, for `N = 7`, `inner = 1.0`, and `outer = 4.0`, values are computed at `r = 1.0, 1.5, 2.0, 2.5, 3.0, 3.5, 4.0`.

The file is written in the format used as input for the `bond_style table` option with `keyword` as the section name. Each line written to the file lists an index number (1-N), a distance (in distance units), an energy (in energy units), and a force (in force units). In case a new file is created, the first line will be a comment with a “DATE:” and “UNITS:” tag with the current date and `units` settings. For subsequent invocations of the `bond_write` command for the same file, data will be appended and the current units settings will be compared to the data from the header, if present, and `bond_write` will refuse to add a table if the units are not the same.
17.8.4 Restrictions

All force field coefficients for bond and other kinds of interactions must be set before this command can be invoked. Due to how the bond force is computed, an inner value > 0.0 must be specified even if the potential has a finite value at \( r = 0.0 \).

17.9 boundary command

17.9.1 Syntax

\[ \text{boundary } x \ y \ z \]

- \( x,y,z = p \) or \( s \) or \( f \) or \( m \), one or two letters
  - \( p \) is periodic
  - \( f \) is non-periodic and fixed
  - \( s \) is non-periodic and shrink-wrapped
  - \( m \) is non-periodic and shrink-wrapped with a minimum value

17.9.2 Examples

\[ \text{boundary } p \ p \ f \]
\[ \text{boundary } p \ f s \ p \]
\[ \text{boundary } s \ f \ s m \]

17.9.3 Description

Set the style of boundaries for the global simulation box in each dimension. A single letter assigns the same style to both the lower and upper face of the box. Two letters assigns the first style to the lower face and the second style to the upper face. The initial size of the simulation box is set by the \text{read_data}, \text{read_restart}, or \text{create_box} commands.

The style \( p \) means the box is periodic, so that particles interact across the boundary, and they can exit one end of the box and re-enter the other end. A periodic dimension can change in size due to constant pressure boundary conditions or box deformation (see the \text{fix npt} and \text{fix deform} commands). The \( p \) style must be applied to both faces of a dimension.

The styles \( f, s, \) and \( m \) mean the box is non-periodic, so that particles do not interact across the boundary and do not move from one side of the box to the other.

For style \( f \), the position of the face is fixed. If an atom moves outside the face it will be deleted on the next timestep that reneighboring occurs. This will typically generate an error unless you have set the \text{thermo_modify lost} option to allow for lost atoms.
For style s, the position of the face is set so as to encompass the atoms in that dimension (shrink-wrapping), no matter how far they move. Note that when the difference between the current box dimensions and the shrink-wrap box dimensions is large, this can lead to lost atoms at the beginning of a run when running in parallel. This is due to the large change in the (global) box dimensions also causing significant changes in the individual sub-domain sizes. If these changes are farther than the communication cutoff, atoms will be lost. This is best addressed by setting initial box dimensions to match the shrink-wrapped dimensions more closely, by using m style boundaries (see below).

For style m, shrink-wrapping occurs, but is bounded by the value specified in the data or restart file or set by the create_box command. For example, if the upper z face has a value of 50.0 in the data file, the face will always be positioned at 50.0 or above, even if the maximum z-extent of all the atoms becomes less than 50.0. This can be useful if you start a simulation with an empty box or if you wish to leave room on one side of the box, e.g. for atoms to evaporate from a surface.

For triclinic (non-orthogonal) simulation boxes, if the second dimension of a tilt factor (e.g. y for xy) is periodic, then the periodicity is enforced with the tilt factor offset. If the first dimension is shrink-wrapped, then the shrink wrapping is applied to the tilted box face, to encompass the atoms. E.g. for a positive xy tilt, the xlo and xhi faces of the box are planes tilting in the +y direction as y increases. These tilted planes are shrink-wrapped around the atoms to determine the x extent of the box.

See the Howto triclinic doc page for a geometric description of triclinic boxes, as defined by LAMMPS, and how to transform these parameters to and from other commonly used triclinic representations.

17.9.4 Restrictions

This command cannot be used after the simulation box is defined by a read_data or create_box command or read_restart command. See the change_box command for how to change the simulation box boundaries after it has been defined.

For 2d simulations, the z dimension must be periodic.

17.9.5 Related commands

See the thermo_modify command for a discussion of lost atoms.

17.9.6 Default

```
boundary p p p
```

17.10 box command

17.10.1 Syntax

```
box keyword value ...
```

- one or more keyword/value pairs may be appended
- keyword = tilt
  
  `tilt value = small or large`
17.10.2 Examples

```
box tilt large
box tilt small
```

17.10.3 Description

Set attributes of the simulation box.

For triclinic (non-orthogonal) simulation boxes, the `tilt` keyword allows simulation domains to be created with arbitrary tilt factors, e.g. via the `create_box` or `read_data` commands. Tilt factors determine how skewed the triclinic box is; see the `Howto triclinic` doc page for a discussion of triclinic boxes in LAMMPS.

LAMMPS normally requires that no tilt factor can skew the box more than half the distance of the parallel box length, which is the first dimension in the tilt factor (x for xz). If `tilt` is set to `small`, which is the default, then an error will be generated if a box is created which exceeds this limit. If `tilt` is set to `large`, then no limit is enforced. You can create a box with any tilt factors you wish.

Note that if a simulation box has a large tilt factor, LAMMPS will run less efficiently, due to the large volume of communication needed to acquire ghost atoms around a processor’s irregular-shaped sub-domain. For extreme values of tilt, LAMMPS may also lose atoms and generate an error.

17.10.4 Restrictions

This command cannot be used after the simulation box is defined by a `read_data` or `create_box` command or `read_restart` command.

17.10.5 Related commands

none

17.10.6 Default

The default value is tilt = small.

17.11 `change_box` command

17.11.1 Syntax

```
change_box group-ID parameter args ... keyword args ...
```

- group-ID = ID of group of atoms to (optionally) displace
- one or more parameter/arg pairs may be appended

```
parameter = x or y or z or xy or xz or yz or boundary or ortho or triclinic or set or remap
x, y, z args = style value(s)
style = final or delta or scale or volume
final values = lo hi
```
lo hi = box boundaries after displacement (distance units)

\[ \text{dlo dhi} = \text{change in box boundaries after displacement (distance units)} \]

scale values = factor

\[ \text{factor} = \text{multiplicative factor for change in box length after displacement} \]

volume value = none = adjust this dim to preserve volume of system

xy, xz, yz args = style value

style = final or delta

\[ \text{final value} = \text{tilt} \]
\[ \text{delta value} = \text{dtilt} \]

\[ \text{dtilt} = \text{change in tilt factor after displacement (distance units)} \]

boundary args = x y z

\[ x,y,z = p \text{ or } s \text{ or } f \text{ or } m, \text{ one or two letters} \]
\[ p \text{ is periodic} \]
\[ f \text{ is non-periodic and fixed} \]
\[ s \text{ is non-periodic and shrink-wrapped} \]
\[ m \text{ is non-periodic and shrink-wrapped with a minimum value} \]

ortho args = none = change box to orthogonal

triclinic args = none = change box to triclinic

set args = none = store state of current box

remap args = none = remap atom coords from last saved state to current box

- zero or more keyword/value pairs may be appended
- keyword = units

units value = lattice or box

\[ \text{lattice} = \text{distances are defined in lattice units} \]
\[ \text{box} = \text{distances are defined in simulation box units} \]

### 17.11.2 Examples

```
change_box all xy final -2.0 z final 0.0 5.0 boundary p p f remap units box
change_box all x scale 1.1 y volume z volume remap
```

### 17.11.3 Description

Change the volume and/or shape and/or boundary conditions for the simulation box. Orthogonal simulation boxes have 3 adjustable size parameters (x,y,z). Triclinic (non-orthogonal) simulation boxes have 6 adjustable size/shape parameters (x,y,z,xy,xz,yz). Any or all of them can be adjusted independently by this command. Thus it can be used to expand or contract a box, or to apply a shear strain to a non-orthogonal box. It can also be used to change the boundary conditions for the simulation box, similar to the `boundary` command.

The size and shape of the initial simulation box are specified by the `create_box` or `read_data` or `read_restart` command used to setup the simulation. The size and shape may be altered by subsequent runs, e.g. by use of the `fix npt` or `fix deform` commands. The `create_box`, `read_data`, and `read_restart` commands also determine whether the simulation box is orthogonal or triclinic and their doc pages explain the meaning of the xy,xz,yz tilt factors.

See the `Howto triclinic` doc page for a geometric description of triclinic boxes, as defined by LAMMPS, and how to transform these parameters to and from other commonly used triclinic representations.
The keywords used in this command are applied sequentially to the simulation box and the atoms in it, in the order specified.

Before the sequence of keywords are invoked, the current box size/shape is stored, in case a remap keyword is used to map the atom coordinates from a previously stored box size/shape to the current one.

After all the keywords have been processed, any shrink-wrap boundary conditions are invoked (see the boundary command) which may change simulation box boundaries, and atoms are migrated to new owning processors.

**Note:** This means that you cannot use the change_box command to enlarge a shrink-wrapped box, e.g. to make room to insert more atoms via the create_atoms command, because the simulation box will be re-shrink-wrapped before the change_box command completes. Instead you could do something like this, assuming the simulation box is non-periodic and atoms extend from 0 to 20 in all dimensions:

```plaintext
change_box all x final -10 20
create_atoms 1 single -5 5 5  # this will fail to insert an atom
change_box all x final -10 20 boundary f s s
create_atoms 1 single -5 5 5
change_box all boundary s s s  # this will work
```

**Note:** Unlike the earlier “displace_box” version of this command, atom remapping is NOT performed by default. This command allows remapping to be done in a more general way, exactly when you specify it (zero or more times) in the sequence of transformations. Thus if you do not use the remap keyword, atom coordinates will not be changed even if the box size/shape changes. If a uniformly strained state is desired, the remap keyword should be specified.

**Note:** It is possible to lose atoms with this command. E.g. by changing the box without remapping the atoms, and having atoms end up outside of non-periodic boundaries. It is also possible to alter bonds between atoms straddling a boundary in bad ways. E.g. by converting a boundary from periodic to non-periodic. It is also possible when remapping atoms to put them (nearly) on top of each other. E.g. by converting a boundary from non-periodic to periodic. All of these will typically lead to bad dynamics and/or generate error messages.

**Note:** The simulation box size/shape can be changed by arbitrarily large amounts by this command. This is not a problem, except that the mapping of processors to the simulation box is not changed from its initial 3d configuration; see the processors command. Thus, if the box size/shape changes dramatically, the mapping of processors to the simulation box may not end up as optimal as the initial mapping attempted to be. You may wish to re-balance the atoms by using the balance command if that is the case.

**Note:** You cannot use this command after reading a restart file (and before a run is performed) if the restart file stored per-atom information from a fix and any of the specified keywords change the box size or shape or boundary conditions. This is because atoms may be moved to new processors and the restart info will not migrate with them. LAMMPS will generate an error if this could happen. Only the ortho and triclinic keywords do not trigger this error. One solution is to perform a “run 0” command before using the change_box command. This clears the per-atom restart data, whether it has been re-assigned to a new fix or not.

**Note:** Because the keywords used in this command are applied one at a time to the simulation box and the atoms in it, care must be taken with triclinic cells to avoid exceeding the limits on skew after each transformation in the sequence.

17.11. change_box command
If skew is exceeded before the final transformation this can be avoided by changing the order of the sequence, or breaking the transformation into two or more smaller transformations. For more information on the allowed limits for box skew see the discussion on triclinic boxes on *How to triclinic* doc page.

For the \( x \), \( y \), and \( z \) parameters, this is the meaning of their styles and values.

For style *final*, the final lo and hi box boundaries of a dimension are specified. The values can be in lattice or box distance units. See the discussion of the units keyword below.

For style *delta*, plus or minus changes in the lo/hi box boundaries of a dimension are specified. The values can be in lattice or box distance units. See the discussion of the units keyword below.

For style *scale*, a multiplicative factor to apply to the box length of a dimension is specified. For example, if the initial box length is 10, and the factor is 1.1, then the final box length will be 11. A factor less than 1.0 means compression.

The *volume* style changes the specified dimension in such a way that the overall box volume remains constant with respect to the operation performed by the preceding keyword. The *volume* style can only be used following a keyword that changed the volume, which is any of the \( x \), \( y \), \( z \) keywords. If the preceding keyword “key” had a *volume* style, then both it and the current keyword apply to the keyword preceding “key”. I.e. this sequence of keywords is allowed:

```
change_box all x scale 1.1 y volume z volume
```

The *volume* style changes the associated dimension so that the overall box volume is unchanged relative to its value before the preceding keyword was invoked.

If the following command is used, then the \( z \) box length will shrink by the same 1.1 factor the \( x \) box length was increased by:

```
change_box all x scale 1.1 z volume
```

If the following command is used, then the \( y,z \) box lengths will each shrink by \( \sqrt{1.1} \) to keep the volume constant. In this case, the \( y,z \) box lengths shrink so as to keep their relative aspect ratio constant:

```
change_box all x scale 1.1 y volume z volume
```

If the following command is used, then the final box will be a factor of 10% larger in \( x \) and \( y \), and a factor of 21% smaller in \( z \), so as to keep the volume constant:

```
change_box all x scale 1.1 z volume y scale 1.1 z volume
```

**Note:** For solids or liquids, when one dimension of the box is expanded, it may be physically undesirable to hold the other 2 box lengths constant since that implies a density change. For solids, adjusting the other dimensions via the *volume* style may make physical sense (just as for a liquid), but may not be correct for materials and potentials whose Poisson ratio is not 0.5.

For the *scale* and *volume* styles, the box length is expanded or compressed around its mid point.

For the \( xy \), \( xz \), and \( yz \) parameters, this is the meaning of their styles and values. Note that changing the tilt factors of a triclinic box does not change its volume.

For style *final*, the final tilt factor is specified. The value can be in lattice or box distance units. See the discussion of the units keyword below.
For style *delta*, a plus or minus change in the tilt factor is specified. The value can be in lattice or box distance units. See the discussion of the units keyword below.

All of these styles change the xy, xz, yz tilt factors. In LAMMPS, tilt factors (xy,xz,yz) for triclinic boxes are required to be no more than half the distance of the parallel box length. For example, if xlo = 2 and xhi = 12, then the x box length is 10 and the xy tilt factor must be between -5 and 5. Similarly, both xz and yz must be between -(xhi-xlo)/2 and +(yhi-ylo)/2. Note that this is not a limitation, since if the maximum tilt factor is 5 (as in this example), then configurations with tilt = ..., -15, -5, 5, 15, 25, ... are all equivalent. Any tilt factor specified by this command must be within these limits.

The *boundary* keyword takes arguments that have exactly the same meaning as they do for the *boundary* command. In each dimension, a single letter assigns the same style to both the lower and upper face of the box. Two letters assigns the first style to the lower face and the second style to the upper face.

The style *p* means the box is periodic; the other styles mean non-periodic. For style *f*, the position of the face is fixed. For style *s*, the position of the face is set so as to encompass the atoms in that dimension (shrink-wrapping), no matter how far they move. For style *m*, shrink-wrapping occurs, but is bounded by the current box edge in that dimension, so that the box will become no smaller. See the *boundary* command for more explanation of these style options.

Note that the “boundary” command itself can only be used before the simulation box is defined via a *read_data* or *create_box* or *read_restart* command. This command allows the boundary conditions to be changed later in your input script. Also note that the *read_restart* will change boundary conditions to match what is stored in the restart file. So if you wish to change them, you should use the *change_box* command after the read_restart command.

**Note:** Changing a periodic boundary to a non-periodic one will also cause the image flag for that dimension to be reset to 0 for all atoms. LAMMPS will print a warning message, if that happens.

The *ortho* and *triclinic* keywords convert the simulation box to be orthogonal or triclinic (non-orthogonal).

The simulation box is defined as either orthogonal or triclinic when it is created via the *create_box*, *read_data*, or *read_restart* commands.

These keywords allow you to toggle the existing simulation box from orthogonal to triclinic and vice versa. For example, an initial equilibration simulation can be run in an orthogonal box, the box can be toggled to triclinic, and then a *non-equilibrium MD (NEMD)* simulation can be run with deformation via the *fix deform* command.

If the simulation box is currently triclinic and has non-zero tilt in xy, yz, or xz, then it cannot be converted to an orthogonal box.

The *set* keyword saves the current box size/shape. This can be useful if you wish to use the *remap* keyword more than once or if you wish it to be applied to an intermediate box size/shape in a sequence of keyword operations. Note that the box size/shape is saved before any of the keywords are processed, i.e. the box size/shape at the time the *create_box* command is encountered in the input script.

The *remap* keyword remaps atom coordinates from the last saved box size/shape to the current box state. For example, if you stretch the box in the x dimension or tilt it in the xy plane via the *x* and *xy* keywords, then the *remap* command will dilate or tilt the atoms to conform to the new box size/shape, as if the atoms moved with the box as it deformed.

Note that this operation is performed without regard to periodic boundaries. Also, any shrink-wrapping of non-periodic boundaries (see the *boundary* command) occurs after all keywords, including this one, have been processed.

Only atoms in the specified group are remapped.
The `units` keyword determines the meaning of the distance units used to define various arguments. A `box` value selects standard distance units as defined by the `units` command, e.g., Angstroms for `units = real` or `metal`. A `lattice` value means the distance units are in lattice spacings. The `lattice` command must have been previously used to define the lattice spacing.

### 17.11.4 Restrictions

If you use the `ortho` or `triclinic` keywords, then at the point in the input script when this command is issued, no `dumps` can be active, nor can a `fix deform` be active. This is because these commands test whether the simulation box is orthogonal when they are first issued. Note that these commands can be used in your script before a `change_box` command is issued, so long as an `undump` or `unfix` command is also used to turn them off.

### 17.11.5 Related commands

`fix deform`, `boundary`

### 17.11.6 Default

The option default is `units = lattice`.

### 17.12 clear command

#### 17.12.1 Syntax

```
clear
```

#### 17.12.2 Examples

```plaintext
(commands for 1st simulation)
clear
(commands for 2nd simulation)
```

#### 17.12.3 Description

This command deletes all atoms, restores all settings to their default values, and frees all memory allocated by LAMMPS. Once a clear command has been executed, it is almost as if LAMMPS were starting over, with only the exceptions noted below. This command enables multiple jobs to be run sequentially from one input script.

These settings are not affected by a clear command: the working directory (`shell` command), log file status (`log` command), echo status (`echo` command), and input script variables (`variable` command).

17.13 comm_modify command

17.13.1 Syntax

```
comm_modify keyword value ...
```

- zero or more keyword/value pairs may be appended
- keyword = mode or cutoff or cutoff/multi or group or vel

  - **mode** value = single or multi = communicate atoms within a single or multiple distances
  - **cutoff** value = Rcut (distance units) = communicate atoms from this far away
  - **cutoff/multi** type value
    - **type** = atom type or type range (supports asterisk notation)
    - **value** = Rcut (distance units) = communicate atoms for selected types from this far away
  - **group** value = group-ID = only communicate atoms in the group
  - **vel** value = yes or no = do or do not communicate velocity info with ghost atoms

17.13.2 Examples

```
comm_modify mode multi
comm_modify mode multi group solvent
comm_modify mode multi cutoff/multi 1 10.0 cutoff/multi 2*4 15.0
comm_modify vel yes
comm_modify mode single cutoff 5.0 vel yes
comm_modify cutoff/multi * 0.0
```
17.13.3 Description

This command sets parameters that affect the inter-processor communication of atom information that occurs each timestep as coordinates and other properties are exchanged between neighboring processors and stored as properties of ghost atoms.

Note: These options apply to the currently defined comm style. When you specify a `comm_style` or `read_restart` command, all communication settings are restored to their default or stored values, including those previously reset by a `comm_modify` command. Thus if your input script specifies a `comm_style` or `read_restart` command, you should use the `comm_modify` command after it.

The `mode` keyword determines whether a single or multiple cutoff distances are used to determine which atoms to communicate.

The default mode is `single` which means each processor acquires information for ghost atoms that are within a single distance from its sub-domain. The distance is by default the maximum of the neighbor cutoff across all atom type pairs.

For many systems this is an efficient algorithm, but for systems with widely varying cutoffs for different type pairs, the `multi` mode can be faster. In this case, each atom type is assigned its own distance cutoff for communication purposes, and fewer atoms will be communicated. See the `neighbor multi` command for a neighbor list construction option that may also be beneficial for simulations of this kind.

The `cutoff` keyword allows you to extend the ghost cutoff distance for communication mode `single`, which is the distance from the borders of a processor’s sub-domain at which ghost atoms are acquired from other processors. By default the ghost cutoff = neighbor cutoff = pairwise force cutoff + neighbor skin. See the `neighbor` command for more information about the skin distance. If the specified Rcut is greater than the neighbor cutoff, then extra ghost atoms will be acquired. If the provided cutoff is smaller, the provided value will be ignored, the ghost cutoff is set to the neighbor cutoff and a warning will be printed. Specifying a cutoff value of 0.0 will reset any previous value to the default. If bonded interactions exist and equilibrium bond length information is available, then also a heuristic based on that bond length is computed. It is used as communication cutoff, if there is no pair style present and no `comm_modify cutoff` command used. Otherwise a warning is printed, if this bond based estimate is larger than the communication cutoff used.

The `cutoff/multi` option is equivalent to `cutoff`, but applies to communication mode `multi` instead. Since in this case the communication cutoffs are determined per atom type, a type specifier is needed and cutoff for one or multiple types can be extended. Also ranges of types using the usual asterisk notation can be given.

These are simulation scenarios in which it may be useful or even necessary to set a ghost cutoff > neighbor cutoff:

- a single polymer chain with bond interactions, but no pairwise interactions
- bonded interactions (e.g. dihedrals) extend further than the pairwise cutoff
- ghost atoms beyond the pairwise cutoff are needed for some computation

In the first scenario, a pairwise potential is not defined. Thus the pairwise neighbor cutoff will be 0.0. But ghost atoms are still needed for computing bond, angle, etc interactions between atoms on different processors, or when the interaction straddles a periodic boundary.

The appropriate ghost cutoff depends on the `newton bond` setting. For `newton bond off`, the distance needs to be the furthest distance between any two atoms in the bond, angle, etc. E.g. the distance between 1-4 atoms in a dihedral. For `newton bond on`, the distance between the central atom in the bond, angle, etc and any other atom is sufficient. E.g. the distance between 2-4 atoms in a dihedral.

In the second scenario, a pairwise potential is defined, but its neighbor cutoff is not sufficiently long enough to enable bond, angle, etc terms to be computed. As in the previous scenario, an appropriate ghost cutoff should be set.
In the last scenario, a fix or compute or pairwise potential needs to calculate with ghost atoms beyond the normal pairwise cutoff for some computation it performs (e.g. locate neighbors of ghost atoms in a multibody pair potential). Setting the ghost cutoff appropriately can insure it will find the needed atoms.

**Note:** In these scenarios, if you do not set the ghost cutoff long enough, and if there is only one processor in a periodic dimension (e.g. you are running in serial), then LAMMPS may “find” the atom it is looking for (e.g. the partner atom in a bond), that is on the far side of the simulation box, across a periodic boundary. This will typically lead to bad dynamics (i.e. the bond length is now the simulation box length). To detect if this is happening, see the neigh_modify cluster command.

The *group* keyword will limit communication to atoms in the specified group. This can be useful for models where no ghost atoms are needed for some kinds of particles. All atoms (not just those in the specified group) will still migrate to new processors as they move. The group specified with this option must also be specified via the atom_modify first command.

The *vel* keyword enables velocity information to be communicated with ghost particles. Depending on the atom_style, velocity info includes the translational velocity, angular velocity, and angular momentum of a particle. If the *vel* option is set to *yes*, then ghost atoms store these quantities; if *no* then they do not. The *yes* setting is needed by some pair styles which require the velocity state of both the I and J particles to compute a pairwise I,J interaction, as well as by some compute and fix commands.

Note that if the fix deform command is being used with its “remap v” option enabled, then the velocities for ghost atoms (in the fix deform group) mirrored across a periodic boundary will also include components due to any velocity shift that occurs across that boundary (e.g. due to dilation or shear).

### 17.13.4 Restrictions

Communication mode *multi* is currently only available for comm_style brick.

### 17.13.5 Related commands

*comm_style*, *neighbor*

### 17.13.6 Default

The option defaults are mode = single, group = all, cutoff = 0.0, vel = no. The cutoff default of 0.0 means that ghost cutoff = neighbor cutoff = pairwise force cutoff + neighbor skin.

### 17.14 comm_style command

#### 17.14.1 Syntax

```
comm_style style
```

- style = brick or tiled

---

17.14. **comm_style command**

---

551
17.14.2 Examples

\texttt{comm\_style brick}
\texttt{comm\_style tiled}

17.14.3 Description

This command sets the style of inter-processor communication of atom information that occurs each timestep as coordinates and other properties are exchanged between neighboring processors and stored as properties of ghost atoms.

For the default \textit{brick} style, the domain decomposition used by LAMMPS to partition the simulation box must be a regular 3d grid of bricks, one per processor. Each processor communicates with its 6 Cartesian neighbors in the grid to acquire information for nearby atoms.

For the \textit{tiled} style, a more general domain decomposition can be used, as triggered by the \textit{balance} or \textit{fix balance} commands. The simulation box can be partitioned into non-overlapping rectangular-shaped “tiles” or varying sizes and shapes. Again there is one tile per processor. To acquire information for nearby atoms, communication must now be done with a more complex pattern of neighboring processors.

Note that this command does not actually define a partitioning of the simulation box (a domain decomposition), rather it determines what kinds of decompositions are allowed and the pattern of communication used to enable the decomposition. A decomposition is created when the simulation box is first created, via the \textit{create\_box} or \textit{read\_data} or \textit{read\_restart} commands. For both the \textit{brick} and \textit{tiled} styles, the initial decomposition will be the same, as described by \textit{create\_box} and \textit{processors} commands. The decomposition can be changed via the \textit{balance} or \textit{fix balance} commands.

17.14.4 Restrictions

None

17.14.5 Related commands

\textit{comm\_modify, processors, balance, fix balance}

17.14.6 Default

The default style is brick.

17.15 compute command

17.15.1 Syntax

\texttt{compute ID group-ID style args}

- \texttt{ID} = user-assigned name for the computation
- \texttt{group-ID} = ID of the group of atoms to perform the computation on
- \texttt{style} = one of a list of possible style names (see below)
- \texttt{args} = arguments used by a particular style
17.15.2 Examples

```
compute 1 all temp
compute newtemp flow temp/partial 1 1 0
compute 3 all ke/atom
```

17.15.3 Description

Define a computation that will be performed on a group of atoms. Quantities calculated by a compute are instantaneous values, meaning they are calculated from information about atoms on the current timestep or iteration, though a compute may internally store some information about a previous state of the system. Defining a compute does not perform a computation. Instead computes are invoked by other LAMMPS commands as needed, e.g. to calculate a temperature needed for a thermostat fix or to generate thermodynamic or dump file output. See the *Howto output* doc page for a summary of various LAMMPS output options, many of which involve computes.

The ID of a compute can only contain alphanumeric characters and underscores.

Computes calculate one of three styles of quantities: global, per-atom, or local. A global quantity is one or more system-wide values, e.g. the temperature of the system. A per-atom quantity is one or more values per atom, e.g. the kinetic energy of each atom. Per-atom values are set to 0.0 for atoms not in the specified compute group. Local quantities are calculated by each processor based on the atoms it owns, but there may be zero or more per atom, e.g. a list of bond distances. Computes that produce per-atom quantities have the word “atom” in their style, e.g. *ke/atom*. Computes that produce local quantities have the word “local” in their style, e.g. *bond/local*. Styles with neither “atom” or “local” in their style produce global quantities.

Note that a single compute can produce either global or per-atom or local quantities, but not both global and per-atom. It can produce local quantities in tandem with global or per-atom quantities. The compute doc page will explain.

Global, per-atom, and local quantities each come in three kinds: a single scalar value, a vector of values, or a 2d array of values. The doc page for each compute describes the style and kind of values it produces, e.g. a per-atom vector. Some computes produce more than one kind of a single style, e.g. a global scalar and a global vector.

When a compute quantity is accessed, as in many of the output commands discussed below, it can be referenced via the following bracket notation, where ID is the ID of the compute:

<table>
<thead>
<tr>
<th>c_ID</th>
<th>entire scalar, vector, or array</th>
</tr>
</thead>
<tbody>
<tr>
<td>c_ID[I]</td>
<td>one element of vector, one column of array</td>
</tr>
<tr>
<td>c_ID[I][J]</td>
<td>one element of array</td>
</tr>
</tbody>
</table>

In other words, using one bracket reduces the dimension of the quantity once (vector -> scalar, array -> vector). Using two brackets reduces the dimension twice (array -> scalar). Thus a command that uses scalar compute values as input can also process elements of a vector or array.

Note that commands and *variables* which use compute quantities typically do not allow for all kinds, e.g. a command may require a vector of values, not a scalar. This means there is no ambiguity about referring to a compute quantity as c_ID even if it produces, for example, both a scalar and vector. The doc pages for various commands explain the details.

In LAMMPS, the values generated by a compute can be used in several ways:

- The results of computes that calculate a global temperature or pressure can be used by fixes that do thermostating or barostatting or when atom velocities are created.
• Global values can be output via the `thermo_style custom` or `fix ave/time` command. Or the values can be referenced in a `variable equal` or `variable atom` command.

• Per-atom values can be output via the `dump custom` command. Or they can be time-averaged via the `fix ave/atom` command or reduced by the `compute reduce` command. Or the per-atom values can be referenced in an `atom-style variable`.

• Local values can be reduced by the `compute reduce` command, or histogrammed by the `fix ave/histo` command, or output by the `dump local` command.

The results of computes that calculate global quantities can be either “intensive” or “extensive” values. Intensive means the value is independent of the number of atoms in the simulation, e.g. temperature. Extensive means the value scales with the number of atoms in the simulation, e.g. total rotational kinetic energy. `Thermodynamic output` will normalize extensive values by the number of atoms in the system, depending on the “thermo_modify norm” setting. It will not normalize intensive values. If a compute value is accessed in another way, e.g. by a `variable`, you may want to know whether it is an intensive or extensive value. See the doc page for individual computes for further info.

LAMMPS creates its own computes internally for thermodynamic output. Three computes are always created, named “`thermo_temp`”, “`thermo_press`”, and “`thermo_pe`”, as if these commands had been invoked in the input script:

```plaintext
compute thermo_temp all temp
compute thermo_press all pressure thermo_temp
compute thermo_pe all pe
```

Additional computes for other quantities are created if the thermo style requires it. See the documentation for the `thermo_style` command.

Fixes that calculate temperature or pressure, i.e. for thermostatting or barostatting, may also create computes. These are discussed in the documentation for specific `fix` commands.

In all these cases, the default computes LAMMPS creates can be replaced by computes defined by the user in the input script, as described by the `thermo_modify` and `fix modify` commands.

Properties of either a default or user-defined compute can be modified via the `compute_modify` command.

Computes can be deleted with the `uncompute` command.

Code for new computes can be added to LAMMPS; see the `Modify` doc page for details. The results of their calculations accessed in the various ways described above.

Each compute style has its own doc page which describes its arguments and what it does. Here is an alphabetic list of compute styles available in LAMMPS. They are also listed in more compact form on the `Commands compute` doc page.

There are also additional accelerated compute styles included in the LAMMPS distribution for faster performance on CPUs, GPUs, and KNLs. The individual style names on the `Commands compute` doc page are followed by one or more of (g,i,k,o,t) to indicate which accelerated styles exist.

• `ackland/atom` - determines the local lattice structure based on the Ackland formulation

• `adf` - angular distribution function of triples of atoms

• `aggregate/atom` - aggregate ID for each atom

• `angle` - energy of each angle sub-style

• `angle/local` - theta and energy of each angle

• `angmom/chunk` - angular momentum for each chunk
• **basal/atom** - calculates the hexagonal close-packed “c” lattice vector of each atom
• **body/local** - attributes of body sub-particles
• **bond** - energy of each bond sub-style
• **bond/local** - distance and energy of each bond
• **centro/atom** - centro-symmetry parameter for each atom
• **centroid/stress/atom** - centroid based stress tensor for each atom
• **chunk/atom** - assign chunk IDs to each atom
• **chunk/spread/atom** - spreads chunk values to each atom in chunk
• **cluster/atom** - cluster ID for each atom
• **cna/atom** - common neighbor analysis (CNA) for each atom
• **cnp/atom** - common neighborhood parameter (CNP) for each atom
• **com** - center-of-mass of group of atoms
• **com/chunk** - center-of-mass for each chunk
• **contact/atom** - contact count for each spherical particle
• **coord/atom** - coordination number for each atom
• **damage/atom** - Peridynamic damage for each atom
• **dihedral** - energy of each dihedral sub-style
• **dihedral/local** - angle of each dihedral
• **dilatation/atom** - Peridynamic dilatation for each atom
• **dipole/chunk** - dipole vector and total dipole for each chunk
• **displace/atom** - displacement of each atom
• **dpd** -
  • **dpd/atom** -
  • **edpd/temp/atom** - per-atom temperature for each eDPD particle in a group
• **entropy/atom** - pair entropy fingerprint of each atom
• **erotate/asphere** - rotational energy of aspherical particles
• **erotate/rigid** - rotational energy of rigid bodies
• **erotate/sphere** - rotational energy of spherical particles
• **erotate/sphere/atom** - rotational energy for each spherical particle
• **event/displace** - detect event on atom displacement
• **fep** -
• **force/tally** -
• **fragment/atom** - fragment ID for each atom
• **global/atom** -
• **group/group** - energy/force between two groups of atoms
• **gyration** - radius of gyration of group of atoms
• gyration/chunk - radius of gyration for each chunk
• gyration/shape - shape parameters from gyration tensor
• gyration/shape/chunk - shape parameters from gyration tensor for each chunk
• heat/flux - heat flux through a group of atoms
• heat/flux/tally -
• hexorder/atom - bond orientational order parameter q6
• hma - harmonically mapped averaging for atomic crystals
• improper - energy of each improper sub-style
• improper/local - angle of each improper
• inertia/chunk - inertia tensor for each chunk
• ke - translational kinetic energy
• ke/atom - kinetic energy for each atom
• ke/atom/eff - per-atom translational and radial kinetic energy in the electron force field model
• ke/eff - kinetic energy of a group of nuclei and electrons in the electron force field model
• ke/rigid - translational kinetic energy of rigid bodies
• mliap - gradients of energy and forces w.r.t. model parameters and related quantities for training machine learning interatomic potentials
• momentum - translational momentum
• msd - mean-squared displacement of group of atoms
• msd/chunk - mean-squared displacement for each chunk
• msd/nongauss - MSD and non-Gaussian parameter of group of atoms
• omega/chunk - angular velocity for each chunk
• orientorder/atom - Steinhardt bond orientational order parameters Ql
• pair - values computed by a pair style
• pair/local - distance/energy/force of each pairwise interaction
• pe - potential energy
• pe/atom - potential energy for each atom
• mesont - Nanotube bending, stretching, and intertube energies
• pe/mol/tally -
• pe/tally -
• plasticity/atom - Peridynamic plasticity for each atom
• pressure - total pressure and pressure tensor
• pressure/cylinder - pressure tensor in cylindrical coordinates
• pressure/uef - pressure tensor in the reference frame of an applied flow field
• property/atom - convert atom attributes to per-atom vectors/arrays
• property/chunk - extract various per-chunk attributes
• **property/local** - convert local attributes to localvectors/arrays
• **ptm/atom** - determines the local lattice structure based on the Polyhedral Template Matching method
• **rdf** - radial distribution function g(r) histogram of group of atoms
• **reduce** - combine per-atom quantities into a single global value
• **reduce/chunk** - reduce per-atom quantities within each chunk
• **reduce/region** - same as compute reduce, within a region
• **rigid/local** - extract rigid body attributes
• **saed** - electron diffraction intensity on a mesh of reciprocal lattice nodes
• **slice** - extract values from global vector or array
• **smd/contact/radius** -
• **smd/damage** - damage status of SPH particles in Smooth Mach Dynamics
• **smd/hourglass/error** -
• **smd/internal/energy** - per-particle enthalpy in Smooth Mach Dynamics
• **smd/plastic/strain** - equivalent plastic strain per particle in Smooth Mach Dynamics
• **smd/plastic/strain/rate** - time rate of the equivalent plastic strain in Smooth Mach Dynamics
• **smd/rho** - per-particle mass density in Smooth Mach Dynamics
• **smd/tlsph/defgrad** - deformation gradient in Smooth Mach Dynamics
• **smd/tlsph/dt** - CFL-stable time increment per particle in Smooth Mach Dynamics
• **smd/tlsph/num/neighs** -
• **smd/tlsph/shape** -
• **smd/tlsph/strain** -
• **smd/tlsph/strain/rate** -
• **smd/tlsph/stress** - per-particle Cauchy stress tensor for SPH particles
• **smd/triangle/vertices** -
• **smd/ulsph/effm** - per-particle effective shear modulus
• **smd/ulsph/num/neighs** -
• **smd/ulsph/strain** -
• **smd/ulsph/strain/rate** -
• **smd/ulsph/stress** - per-particle Cauchy stress tensor and von Mises equivalent stress in Smooth Mach Dynamics
• **smd/vol** - per-particle volumes and their sum in Smooth Mach Dynamics
• **snap** - gradients of SNAP energy and forces w.r.t. linear coefficients and related quantities for fitting SNAP potentials
• **sna/atom** - bispectrum components for each atom
• **snad/atom** - derivative of bispectrum components for each atom
• **snav/atom** - virial contribution from bispectrum components for each atom
• **sph/e/atom** - per-atom internal energy of Smooth-Particle Hydrodynamics atoms
• *sph/rho/atom* - per-atom density of Smooth-Particle Hydrodynamics atoms
• *sph/t/atom* - per-atom internal temperature of Smooth-Particle Hydrodynamics atoms
• *spin* - magnetic quantities for a system of atoms having spins
• *stress/atom* - stress tensor for each atom
• *stress/mop* - normal components of the local stress tensor using the method of planes
• *stress/mop/profile* - profile of the normal components of the local stress tensor using the method of planes
• *stress/tally* -
• *tdpd/cc/atom* - per-atom chemical concentration of a specified species for each tDPD particle
• *temp* - temperature of group of atoms
• *temp/asphere* - temperature of aspherical particles
• *temp/body* - temperature of body particles
• *temp/chunk* - temperature of each chunk
• *temp/com* - temperature after subtracting center-of-mass velocity
• *temp/cs* - temperature based on the center-of-mass velocity of atom pairs that are bonded to each other
• *temp/deform* - temperature excluding box deformation velocity
• *temp/deform/eff* - temperature excluding box deformation velocity in the electron force field model
• *temp/drude* - temperature of Core-Drude pairs
• *temp/eff* - temperature of a group of nuclei and electrons in the electron force field model
• *temp/partial* - temperature excluding one or more dimensions of velocity
• *temp/profile* - temperature excluding a binned velocity profile
• *temp/ramp* - temperature excluding ramped velocity component
• *temp/region* - temperature of a region of atoms
• *temp/region/eff* - temperature of a region of nuclei and electrons in the electron force field model
• *temp/rotate* - temperature of a group of atoms after subtracting out their center-of-mass and angular velocities
• *temp/sphere* - temperature of spherical particles
• *temp/uef* - kinetic energy tensor in the reference frame of an applied flow field
• *ti* - thermodynamic integration free energy values
• *torque/chunk* - torque applied on each chunk
• *vacf* - velocity auto-correlation function of group of atoms
• *vcm/chunk* - velocity of center-of-mass for each chunk
• *viscosity/cos* - velocity profile under cosine-shaped acceleration
• *voronoi/atom* - Voronoi volume and neighbors for each atom
• *xrd* - x-ray diffraction intensity on a mesh of reciprocal lattice nodes
17.15.4 Restrictions

none

17.15.5 Related commands

uncompute, compute_modify, fix ave/atom, fix ave/time, fix ave/histo

17.15.6 Default

none

17.16 compute_modify command

17.16.1 Syntax

\[ \text{compute_modify} \text{ compute-ID keyword value ...} \]

- compute-ID = ID of the compute to modify
- one or more keyword/value pairs may be listed
- keyword = extra/dof or extra or dynamic/dof or dynamic
  - extra/dof value = N
    - N = # of extra degrees of freedom to subtract
    - extra syntax is identical to extra/dof, will be disabled at some point
  - dynamic/dof value = yes or no
    - yes/no = do or do not re-compute the number of degrees of freedom (DOF)
    - dynamic syntax is identical to dynamic/dof, will be disabled at some point

17.16.2 Examples

\[ \text{compute_modify} \text{ myTemp extra/dof 0} \]
\[ \text{compute_modify} \text{ newtemp dynamic/dof yes extra/dof 600} \]

17.16.3 Description

Modify one or more parameters of a previously defined compute. Not all compute styles support all parameters.

The extra/dof or extra keyword refers to how many degrees-of-freedom are subtracted (typically from 3N) as a normalizing factor in a temperature computation. Only computes that compute a temperature use this option. The default is 2 or 3 for 2d or 3d systems which is a correction factor for an ensemble of velocities with zero total linear momentum. For compute temp/partial, if one or more velocity components are excluded, the value used for extra is scaled accordingly. You can use a negative number for the extra parameter if you need to add degrees-of-freedom. See the compute temp/asphere command for an example.

The dynamic/dof or dynamic keyword determines whether the number of atoms N in the compute group and their associated degrees of freedom are re-computed each time a temperature is computed. Only compute styles that calculate
a temperature use this option. By default, N and their DOF are assumed to be constant. If you are adding atoms or molecules to the system (see the fix pour, fix deposit, and fix gcmc commands) or expect atoms or molecules to be lost (e.g. due to exiting the simulation box or via fix evaporate), then this option should be used to insure the temperature is correctly normalized.

**Note:** The extra and dynamic keywords should not be used as they are deprecated (March 2017) and will eventually be disabled. Instead, use the equivalent extra/dof and dynamic/dof keywords.

### 17.16.4 Restrictions

none

### 17.16.5 Related commands

compute

### 17.16.6 Default

The option defaults are extra/dof = 2 or 3 for 2d or 3d systems and dynamic/dof = no.

### 17.17 create_atoms command

#### 17.17.1 Syntax

```
create_atoms type style args keyword values ... 
```

- **type** = atom type (1-Ntypes) of atoms to create (offset for molecule creation)
- **style** = box or region or single or random
  - box args = none
  - region args = region-ID
    - region-ID = particles will only be created if contained in the region
  - single args = x y z
    - x,y,z = coordinates of a single particle (distance units)
  - random args = N seed region-ID
    - N = number of particles to create
    - seed = random # seed (positive integer)
    - region-ID = create atoms within this region, use NULL for entire simulation box
- **zero or more keyword/value pairs may be appended**
- **keyword** = mol or basis or ratio or subset or remap or var or set or rotate or units
  - **mol** = value = template-ID seed
    - template-ID = ID of molecule template specified in a separate molecule command
    - seed = random # seed (positive integer)
### 17.17.2 Examples

```plaintext
create_atoms 1 box
create_atoms 3 region regsphere basis 2 3
create_atoms 3 region regsphere basis 2 3 ratio 0.5 74637
create_atoms 3 single 0 0 5
create_atoms 1 box var v set x xpos set y ypos
```

### 17.17.3 Description

This command creates atoms (or molecules) on a lattice, or a single atom (or molecule), or a random collection of atoms (or molecules), as an alternative to reading in their coordinates explicitly via a `read_data` or `read_restart` command. A simulation box must already exist, which is typically created via the `create_box` command. Before using this command, a lattice must also be defined using the `lattice` command, unless you specify the `single` style with units = box or the `random` style. For the remainder of this doc page, a created atom or molecule is referred to as a “particle”.

If created particles are individual atoms, they are assigned the specified atom `type`, though this can be altered via the `basis` keyword as discussed below. If molecules are being created, the type of each atom in the created molecule is specified in the file read by the `molecule` command, and those values are added to the specified atom `type`. E.g. if `type` = 2, and the file specifies atom types 1,2,3, then each created molecule will have atom types 3,4,5.

For the `box` style, the `create_atoms` command fills the entire simulation box with particles on the lattice. If your simulation box is periodic, you should insure its size is a multiple of the lattice spacings, to avoid unwanted atom overlaps at the box boundaries. If your box is periodic and a multiple of the lattice spacing in a particular dimension, LAMMPS is careful to put exactly one particle at the boundary (on either side of the box), not zero or two.

For the `region` style, a geometric volume is filled with particles on the lattice. This volume what is inside the simulation box and is also consistent with the region volume. See the `region` command for details. Note that a region can be specified so that its “volume” is either inside or outside a geometric boundary. Also note that if your region is the same size as a periodic simulation box (in some dimension), LAMMPS does not implement the same logic described above as for the `box` style, to insure exactly one particle at periodic boundaries. if this is what you desire, you should either use the `box` style, or tweak the region size to get precisely the particles you want.
For the single style, a single particle is added to the system at the specified coordinates. This can be useful for debugging purposes or to create a tiny system with a handful of particles at specified positions.

For the random style, N particles are added to the system at randomly generated coordinates, which can be useful for generating an amorphous system. The particles are created one by one using the specified random number seed, resulting in the same set of particles coordinates, independent of how many processors are being used in the simulation. If the region-ID argument is specified as NULL, then the created particles will be anywhere in the simulation box. If a region-ID is specified, a geometric volume is filled which is both inside the simulation box and is also consistent with the region volume. See the region command for details. Note that a region can be specified so that its “volume” is either inside or outside a geometric boundary.

Note: Particles generated by the random style will typically be highly overlapped which will cause many interatomic potentials to compute large energies and forces. Thus you should either perform an energy minimization or run dynamics with fix nve/limit to equilibrate such a system, before running normal dynamics.

Note that this command adds particles to those that already exist. This means it can be used to add particles to a system previously read in from a data or restart file. Or the create_atoms command can be used multiple times, to add multiple sets of particles to the simulation. For example, grain boundaries can be created, by interleaving create_atoms with lattice commands specifying different orientations. By using the create_atoms command in conjunction with the delete_atoms command, reasonably complex geometries can be created, or a protein can be solvated with a surrounding box of water molecules.

In all these cases, care should be taken to insure that new atoms do not overlap existing atoms inappropriately, especially if molecules are being added. The delete_atoms command can be used to remove overlapping atoms or molecules.

Note: You cannot use any of the styles explained above to create atoms that are outside the simulation box; they will just be ignored by LAMMPS. This is true even if you are using shrink-wrapped box boundaries, as specified by the boundary command. However, you can first use the change_box command to temporarily expand the box, then add atoms via create_atoms, then finally use change_box command again if needed to re-shrink-wrap the new atoms. See the change_box doc page for an example of how to do this, using the create_atoms single style to insert a new atom outside the current simulation box.

Individual atoms are inserted by this command, unless the mol keyword is used. It specifies a template-ID previously defined using the molecule command, which reads a file that defines the molecule. The coordinates, atom types, charges, etc, as well as any bond/angle/etc and special neighbor information for the molecule can be specified in the molecule file. See the molecule command for details. The only settings required to be in this file are the coordinates and types of atoms in the molecule.

Using a lattice to add molecules, e.g. via the box or region or single styles, is exactly the same as adding atoms on lattice points, except that entire molecules are added at each point, i.e. on the point defined by each basis atom in the unit cell as it tiles the simulation box or region. This is done by placing the geometric center of the molecule at the lattice point, and giving the molecule a random orientation about the point. The random seed specified with the mol keyword is used for this operation, and the random numbers generated by each processor are different. This means the coordinates of individual atoms (in the molecules) will be different when running on different numbers of processors, unlike when atoms are being created in parallel.

Also note that because of the random rotations, it may be important to use a lattice with a large enough spacing that adjacent molecules will not overlap, regardless of their relative orientations.

Note: If the create_box command is used to create the simulation box, followed by the create_atoms command with its mol option for adding molecules, then you typically need to use the optional keywords allowed by the create_box
command for extra bonds (angles, etc) or extra special neighbors. This is because by default, the `create_box` command sets up a non-molecular system which does not allow molecules to be added.

This is the meaning of the other allowed keywords.

The `basis` keyword is only used when atoms (not molecules) are being created. It specifies an atom type that will be assigned to specific basis atoms as they are created. See the `lattice` command for specifics on how basis atoms are defined for the unit cell of the lattice. By default, all created atoms are assigned the argument `type` as their atom type.

The `ratio` and `subset` keywords can be used in conjunction with the `box` or `region` styles to limit the total number of particles inserted. The lattice defines a set of `Nlatt` eligible sites for inserting particles, which may be limited by the `region` style or the `var` and `set` keywords. For the `ratio` keyword only the specified fraction of them (0 ≤ frac ≤ 1) will be assigned particles. For the `subset` keyword only the specified `Nsubset` of them will be assigned particles. In both cases the assigned lattice sites are chosen randomly. An iterative algorithm is used which insures the correct number of particles are inserted, in a perfectly random fashion. Which lattice sites are selected will change with the number of processors used.

The `remap` keyword only applies to the `single` style. If it is set to `yes`, then if the specified position is outside the simulation box, it will mapped back into the box, assuming the relevant dimensions are periodic. If it is set to `no`, no remapping is done and no particle is created if its position is outside the box.

The `var` and `set` keywords can be used together to provide a criterion for accepting or rejecting the addition of an individual atom, based on its coordinates. The `name` specified for the `var` keyword is the name of an `equal-style variable` which should evaluate to a zero or non-zero value based on one or two or three variables which will store the x, y, or z coordinates of an atom (one variable per coordinate). If used, these other variables must be `internal-style variables` defined in the input script; their initial numeric value can be anything. They must be internal-style variables, because this command resets their values directly. The `set` keyword is used to identify the names of these other variables, one variable for the x-coordinate of a created atom, one for y, and one for z.

When an atom is created, its x, y, z coordinates become the values for any `set` variable that is defined. The `var` variable is then evaluated. If the returned value is 0.0, the atom is not created. If it is non-zero, the atom is created.

As an example, these commands can be used in a 2d simulation, to create a sinusoidal surface. Note that the surface is “rough” due to individual lattice points being “above” or “below” the mathematical expression for the sinusoidal curve. If a finer lattice were used, the sinusoid would appear to be “smoother”. Also note the use of the “xlat” and “ylat” `thermo_style` keywords which converts lattice spacings to distance.

```
dimension 2
variable x equal 100
variable y equal 25
lattice hex 0.8442
region box block 0 $x 0 $y -0.5 0.5
create_box 1 box

variable xx internal 0.0
variable yy internal 0.0
variable v equal "(0.2*v_y*ylat + cos(v_xx/xlat * 2.0*PI*4.0/v_x) + 0.5*v_y*ylat - v_yy) > 0.0"
create_atoms 1 box var v set x xx set y yy
write_dump all atom sinusoid.lammpstrj
```
The rotate keyword allows specification of the orientation at which molecules are inserted. The axis of rotation is determined by the rotation vector \((R_x, R_y, R_z)\) that goes through the insertion point. The specified \(\theta\) determines the angle of rotation around that axis. Note that the direction of rotation for the atoms around the rotation axis is consistent with the right-hand rule: if your right-hand’s thumb points along \(R\), then your fingers wrap around the axis in the direction of rotation.

The units keyword determines the meaning of the distance units used to specify the coordinates of the one particle created by the single style. A box value selects standard distance units as defined by the units command, e.g. Angstroms for units = real or metal. A lattice value means the distance units are in lattice spacings.

Atom IDs are assigned to created atoms in the following way. The collection of created atoms are assigned consecutive IDs that start immediately following the largest atom ID existing before the create_atoms command was invoked. This is done by the processor’s communicating the number of atoms they each own, the first processor numbering its atoms from 1 to \(N_1\), the second processor from \(N_1+1\) to \(N_2\), etc. Where \(N_1 = \) number of atoms owned by the first processor, \(N_2 = \) number owned by the second processor, etc. Thus when the same simulation is performed on different numbers of processors, there is no guarantee a particular created atom will be assigned the same ID in both simulations. If molecules are being created, molecule IDs are assigned to created molecules in a similar fashion.

Aside from their ID, atom type, and xyz position, other properties of created atoms are set to default values, depending on which quantities are defined by the chosen atom style. See the atom style command for more details. See the set and velocity commands for info on how to change these values.

- charge = 0.0
- dipole moment magnitude = 0.0
- diameter = 1.0
- shape = 0.0 0.0 0.0
- density = 1.0
- volume = 1.0
- velocity = 0.0 0.0 0.0
- angular velocity = 0.0 0.0 0.0
- angular momentum = 0.0 0.0 0.0
- quaternion = (1,0,0,0)
- bonds, angles, dihedrals, impropers = none
If molecules are being created, these defaults can be overridden by values specified in the file read by the `molecule` command. E.g. the file typically defines bonds (angles, etc) between atoms in the molecule, and can optionally define charges on each atom.

Note that the `sphere` atom style sets the default particle diameter to 1.0 as well as the density. This means the mass for the particle is not 1.0, but is $\pi/6 \times \text{diameter}^3 = 0.5236$.

Note that the `ellipsoid` atom style sets the default particle shape to (0.0 0.0 0.0) and the density to 1.0 which means it is a point particle, not an ellipsoid, and has a mass of 1.0.

Note that the `peri` style sets the default volume and density to 1.0 and thus also set the mass for the particle to 1.0. The `set` command can be used to override many of these default settings.

### 17.17.4 Restrictions

An `atom_style` must be previously defined to use this command.

A rotation vector specified for a single molecule must be in the z-direction for a 2d model.

### 17.17.5 Related commands

`lattice`, `region`, `create_box`, `read_data`, `read_restart`

### 17.17.6 Default

The default for the `basis` keyword is that all created atoms are assigned the argument `type` as their atom type (when single atoms are being created). The other defaults are `remap = no`, `rotate = random`, and `units = lattice`.

### 17.18 create_bonds command

#### 17.18.1 Syntax

```
create_bonds style args ... keyword value ...  
```

- `style = many` or `single/bond` or `single/angle` or `single/dihedral`

  `many` args = `group-ID group2-ID btype rmin rmax`
  - `group-ID` = ID of first group
  - `group2-ID` = ID of second group, bonds will be between atoms in the 2 groups
  - `btype` = bond type of created bonds
  - `rmin` = minimum distance between pair of atoms to bond together
  - `rmax` = maximum distance between pair of atoms to bond together

  `single/bond` args = `btype batom1 batom2`
  - `btype` = bond type of new bond
  - `batom1`, `batom2` = atom IDs for two atoms in bond

  `single/angle` args = `atype aatom1 aatom2 aatom3`
  - `atype` = angle type of new angle
  - `aatom1`, `aatom2`, `aatom3` = atom IDs for three atoms in angle

  `single/dihedral` args = `dtype datom1 datom2 datom3 datom4`
  - `dtype` = dihedral type of new dihedral
  - `datom1`, `datom2`, `datom3`, `datom4` = atom IDs for four atoms in dihedral
dtype = dihedral type of new dihedral
datom1,datom2,datom3,datom4 = atom IDs for four atoms in dihedral

single/improper args = itype iatom1 iatom2 iatom3 iatom4
itype = improper type of new improper
iatom1,iatom2,iatom3,iatom4 = atom IDs for four atoms in improper

• zero or more keyword/value pairs may be appended
• keyword = special

special value = yes or no

17.18.3 Description

Create bonds between pairs of atoms that meet a specified distance criteria. Or create a single bond, angle, dihedral or improper between 2, 3, or 4 specified atoms.

The new bond (angle, dihedral, improper) interactions will then be computed during a simulation by the bond (angle, dihedral, improper) potential defined by the bond_style, bond_coeff, angle_style, angle_coeff, dihedral_style, dihedral_coeff, improper_style, improper_coeff commands.

The many style is useful for adding bonds to a system, e.g. between nearest neighbors in a lattice of atoms, without having to enumerate all the bonds in the data file read by the read_data command.

The single styles are useful for adding bonds, angles, dihedrals, impropers to a system incrementally, then continuing a simulation.

Note that this command does not auto-create any angle, dihedral or improper interactions when a bond is added. Nor does it auto-create any bonds when an angle, dihedral or improper is added. Or auto-create any angles when a dihedral or improper is added. Thus the flexibility of this command is limited. It can be used several times to create different types of bond at different distances. But it cannot typically auto-create all the bonds or angles or dihedrals or impropers that would normally be defined in a data file for a complex system of molecules.

Note: If the system has no bonds (angles, dihedrals, impropers) to begin with, or if more bonds per atom are being added than currently exist, then you must insure that the number of bond types and the maximum number of bonds per atom are set to large enough values. And similarly for angles, dihedrals and impropers. Otherwise an error may occur when too many bonds (angles, dihedrals, impropers) are added to an atom. If the read_data command is used to define the system, these parameters can be set via the “bond types” and “extra bond per atom” fields in the header section of the data file. If the create_box command is used to define the system, these 2 parameters can be set via its optional “bond/types” and “extra/bond/per/atom” arguments. And similarly for angles, dihedrals and impropers. See the doc pages for these 2 commands for details.

The many style will create bonds between pairs of atoms LJ where I is in one of the two specified groups, and J is in the other. The two groups can be the same, e.g. group “all”. The created bonds will be of bond type btype, where btype must be a value between 1 and the number of bond types defined.
For a bond to be created, an I,J pair of atoms must be a distance D apart such that \( r_{\text{min}} \leq D \leq r_{\text{max}} \).

The following settings must have been made in an input script before this style is used:

- special_bonds weight for 1-2 interactions must be 0.0
- a pair_style must be defined
- no kspace_style defined
- minimum pair_style cutoff + neighbor skin \( \geq r_{\text{max}} \)

These settings are required so that a neighbor list can be created to search for nearby atoms. Pairs of atoms that are already bonded cannot appear in the neighbor list, to avoid creation of duplicate bonds. The neighbor list for all atom type pairs must also extend to a distance that encompasses the \( r_{\text{max}} \) for new bonds to create.

An additional requirement for this style is that your system must be ready to perform a simulation. This means, for example, that all pair_style coefficients be set via the pair_coeff command. A bond_style command and all bond coefficients must also be set, even if no bonds exist before this command is invoked. This is because the building of neighbor list requires initialization and setup of a simulation, similar to what a run command would require.

Note that you can change any of these settings after this command executes, e.g. if you wish to use long-range Coulombic interactions via the kspace_style command for your subsequent simulation.

The single/bond style creates a single bond of type \( b_{\text{type}} \) between two atoms with IDs \( b_{\text{atom1}} \) and \( b_{\text{atom2}} \). \( b_{\text{type}} \) must be a value between 1 and the number of bond types defined.

The single/angle style creates a single angle of type \( a_{\text{type}} \) between three atoms with IDs \( a_{\text{atom1}}, a_{\text{atom2}}, \) and \( a_{\text{atom3}} \). The ordering of the atoms is the same as in the Angles section of a data file read by the read_data command. I.e. the 3 atoms are ordered linearly within the angle; the central atom is \( a_{\text{atom2}} \). \( a_{\text{type}} \) must be a value between 1 and the number of angle types defined.

The single/dihedral style creates a single dihedral of type \( d_{\text{type}} \) between four atoms with IDs \( d_{\text{atom1}}, d_{\text{atom2}}, d_{\text{atom3}}, \) and \( d_{\text{atom4}} \). The ordering of the atoms is the same as in the Dihedrals section of a data file read by the read_data command. I.e. the 4 atoms are ordered linearly within the dihedral. \( d_{\text{type}} \) must be a value between 1 and the number of dihedral types defined.

The single/improper style creates a single improper of type \( i_{\text{type}} \) between four atoms with IDs \( i_{\text{atom1}}, i_{\text{atom2}}, i_{\text{atom3}}, \) and \( i_{\text{atom4}} \). The ordering of the atoms is the same as in the Impropers section of a data file read by the read_data command. I.e. the 4 atoms are ordered linearly within the improper. \( i_{\text{type}} \) must be a value between 1 and the number of improper types defined.

The keyword special controls whether an internal list of special bonds is created after one or more bonds, or a single angle, dihedral or improper is added to the system.

The default value is yes. A value of no cannot be used with the many style.

This is an expensive operation since the bond topology for the system must be walked to find all 1-2, 1-3, 1-4 interactions to store in an internal list, which is used when pairwise interactions are weighted; see the special_bonds command for details.

Thus if you are adding a few bonds or a large list of angles all at the same time, by using this command repeatedly, it is more efficient to only trigger the internal list to be created once, after the last bond (or angle, or dihedral, or improper) is added:

```
create_bonds single/bond 5 52 98 special no
create_bonds single/bond 5 73 74 special no
... 
create_bonds single/bond 5 17 386 special no
create_bonds single/bond 4 112 183 special yes
```
Note that you MUST insure the internal list is re-built after the last bond (angle, dihedral, improper) is added, before performing a simulation. Otherwise pairwise interactions will not be properly excluded or weighted. LAMMPS does NOT check that you have done this correctly.

17.18.4 Restrictions

This command cannot be used with molecular systems defined using molecule template files via the molecule and atom_style template commands.

17.18.5 Related commands

create_atoms, delete_bonds

17.18.6 Default

The keyword default is special = yes.

17.19 create_box command

17.19.1 Syntax

```
create_box N region-ID keyword value ...
```

- N = # of atom types to use in this simulation
- region-ID = ID of region to use as simulation domain
- zero or more keyword/value pairs may be appended
- keyword = bond/types or angle/types or dihedral/types or improper/types or extra/bond/per/atom or extra/angle/per/atom or extra/dihedral/per/atom or extra/improper/per/atom

- bond/types value = # of bond types
- angle/types value = # of angle types
- dihedral/types value = # of dihedral types
- improper/types value = # of improper types
- extra/bond/per/atom value = # of bonds per atom
- extra/angle/per/atom value = # of angles per atom
- extra/dihedral/per/atom value = # of dihedrals per atom
- extra/improper/per/atom value = # of impropers per atom
- extra/special/per/atom value = # of special neighbors per atom
17.19.2 Examples

```
create_box 2 mybox
create_box 2 mybox bond/types 2 extra/bond/per/atom 1
```

17.19.3 Description

This command creates a simulation box based on the specified region. Thus a region command must first be used to define a geometric domain. It also partitions the simulation box into a regular 3d grid of rectangular bricks, one per processor, based on the number of processors being used and the settings of the processors command. The partitioning can later be changed by the balance or fix balance commands.

The argument \( N \) is the number of atom types that will be used in the simulation.

If the region is not of style prism, then LAMMPS encloses the region (block, sphere, etc) with an axis-aligned orthogonal bounding box which becomes the simulation domain.

If the region is of style prism, LAMMPS creates a non-orthogonal simulation domain shaped as a parallelepiped with triclinic symmetry. As defined by the region prism command, the parallelepiped has its “origin” at \((xlo,ylo,zlo)\) and is defined by 3 edge vectors starting from the origin given by \( A = (xhi-xlo,0,0) \); \( B = (xy,yhi-ylo,0) \); \( C = (xz,yz,zhi-zlo) \). \( xhi,yhi,zhi \) can be 0.0 or positive or negative values and are called “tilt factors” because they are the amount of displacement applied to faces of an originally orthogonal box to transform it into the parallelepiped.

By default, a prism region used with the create_box command must have tilt factors \((xy,xz,yz)\) that do not skew the box more than half the distance of the parallel box length. For example, if \( xlo = 2 \) and \( xhi = 12 \), then the x box length is 10 and the \( xy \) tilt factor must be between -5 and 5. Similarly, both \( xz \) and \( yz \) must be between \(-\frac{(xhi-xlo)}{2}\) and \(+\frac{(yhi-ylo)}{2}\). Note that this is not a limitation, since if the maximum tilt factor is 5 (as in this example), then configurations with tilt = \( \ldots, -15, -5, 5, 15, 25, \ldots \) are all geometrically equivalent. If you wish to define a box with tilt factors that exceed these limits, you can use the box tilt command, with a setting of large; a setting of small is the default.

See the Howto triclinic doc page for a geometric description of triclinic boxes, as defined by LAMMPS, and how to transform these parameters to and from other commonly used triclinic representations.

When a prism region is used, the simulation domain should normally be periodic in the dimension that the tilt is applied to, which is given by the second dimension of the tilt factor (e.g. \( y \) for \( xy \) tilt). This is so that pairs of atoms interacting across that boundary will have one of them shifted by the tilt factor. Periodicity is set by the boundary command. For example, if the \( xy \) tilt factor is non-zero, then the \( y \) dimension should be periodic. Similarly, the \( z \) dimension should be periodic if \( xz \) or \( yz \) is non-zero. LAMMPS does not require this periodicity, but you may lose atoms if this is not the case.

Also note that if your simulation will tilt the box, e.g. via the fix deform command, the simulation box must be setup to be triclinic, even if the tilt factors are initially 0.0. You can also change an orthogonal box to a triclinic box or vice versa by using the change box command with its ortho and triclinic options.

**Note:** If the system is non-periodic (in a dimension), then you should not make the lo/hi box dimensions (as defined in your region command) radically smaller/larger than the extent of the atoms you eventually plan to create, e.g. via the create_atoms command. For example, if your atoms extend from 0 to 50, you should not specify the box bounds as \(-10000\) and \(10000\). This is because as described above, LAMMPS uses the specified box size to layout the 3d grid of processors. A huge (mostly empty) box will be sub-optimal for performance when using “fixed” boundary conditions (see the boundary command). When using “shrink-wrap” boundary conditions (see the boundary command), a huge (mostly empty) box may cause a parallel simulation to lose atoms the first time that LAMMPS shrink-wraps the box around the atoms.
The optional keywords can be used to create a system that allows for bond (angle, dihedral, improper) interactions, or for molecules with special 1-2,1-3,1-4 neighbors to be added later. These optional keywords serve the same purpose as the analogous keywords that can be used in a data file which are recognized by the `read_data` command when it sets up a system.

Note that if these keywords are not used, then the `create_box` command creates an atomic (non-molecular) simulation that does not allow bonds between pairs of atoms to be defined, or a bond potential to be specified, or for molecules with special neighbors to be added to the system by commands such as `create_atoms mol`, `fix deposit` or `fix pour`.

As an example, see the examples/deposit/in.deposit.molecule script, which deposits molecules onto a substrate. Initially there are no molecules in the system, but they are added later by the `fix deposit` command. The `create_box` command in the script uses the bond/types and extra/bond/per/atom keywords to allow this. If the added molecule contained more than 1 special bond (allowed by default), an extra/special/per/atom keyword would also need to be specified.

### 17.19.4 Restrictions

An `atom_style` and `region` must have been previously defined to use this command.

### 17.19.5 Related commands

`read_data`, `create_atoms`, `region`

### 17.19.6 Default

none

### 17.20 delete_atoms command

#### 17.20.1 Syntax

```
delete_atoms style args keyword value ...
```

- **style** = `group` or `region` or `overlap` or `porosity`
  - `group` args = group-ID
  - `region` args = region-ID
  - `overlap` args = cutoff group1-ID group2-ID
    - cutoff = delete one atom from pairs of atoms within the cutoff (distance units)
    - group1-ID = one atom in pair must be in this group
    - group2-ID = other atom in pair must be in this group
  - `porosity` args = region-ID fraction seed
    - region-ID = region within which to perform deletions
    - fraction = delete this fraction of atoms
    - seed = random number seed (positive integer)

- zero or more keyword/value pairs may be appended
- **keyword** = `compress` or `bond` or `mol`
compress value = no or yes
bond value = no or yes
mol value = no or yes

17.20.2 Examples

```
delete_atoms group edge
delete_atoms region sphere compress no
delete_atoms overlap 0.3 all all
delete_atoms overlap 0.5 solvent colloid
delete_atoms porosity cube 0.1 482793 bond yes
```

17.20.3 Description

Delete the specified atoms. This command can be used to carve out voids from a block of material or to delete created atoms that are too close to each other (e.g. at a grain boundary).

For style `group`, all atoms belonging to the group are deleted.

For style `region`, all atoms in the region volume are deleted. Additional atoms can be deleted if they are in a molecule for which one or more atoms were deleted within the region; see the `mol` keyword discussion below.

For style `overlap` pairs of atoms whose distance of separation is within the specified cutoff distance are searched for, and one of the 2 atoms is deleted. Only pairs where one of the two atoms is in the first group specified and the other atom is in the second group are considered. The atom that is in the first group is the one that is deleted.

Note that it is OK for the two group IDs to be the same (e.g. group `all`), or for some atoms to be members of both groups. In these cases, either atom in the pair may be deleted. Also note that if there are atoms which are members of both groups, the only guarantee is that at the end of the deletion operation, enough deletions will have occurred that no atom pairs within the cutoff will remain (subject to the group restriction). There is no guarantee that the minimum number of atoms will be deleted, or that the same atoms will be deleted when running on different numbers of processors.

For style `porosity` a specified `fraction` of atoms are deleted within the specified region. For example, if fraction is 0.1, then 10% of the atoms will be deleted. The atoms to delete are chosen randomly. There is no guarantee that the exact fraction of atoms will be deleted, or that the same atoms will be deleted when running on different numbers of processors.

If the `compress` keyword is set to `yes`, then after atoms are deleted, then atom IDs are re-assigned so that they run from 1 to the number of atoms in the system. Note that this is not done for molecular systems (see the `atom_style` command), regardless of the `compress` setting, since it would foul up the bond connectivity that has already been assigned. However, the `reset_atom_ids` command can be used after this command to accomplish the same thing.

Note that the re-assignment of IDs is not really a compression, where gaps in atom IDs are removed by decrementing atom IDs that are larger. Instead the IDs for all atoms are erased, and new IDs are assigned so that the atoms owned by individual processors have consecutive IDs, as the `create_atoms` command explains.

A molecular system with fixed bonds, angles, dihedrals, or improper interactions, is one where the topology of the interactions is typically defined in the data file read by the `read_data` command, and where the interactions themselves are defined with the `bond_style`, `angle_style`, etc commands. If you delete atoms from such a system, you must be careful not to end up with bonded interactions that are stored by remaining atoms but which include deleted atoms. This will cause LAMMPS to generate a “missing atoms” error when the bonded interaction is computed. The `bond` and `mol` keywords offer two ways to do that.

If the `bond` keyword is set to `yes` then any bond or angle or dihedral or improper interaction that includes a deleted atom is also removed from the lists of such interactions stored by non-deleted atoms. Note that simply deleting interactions
due to dangling bonds (e.g. at a surface) may result in an inaccurate or invalid model for the remaining atoms.

If the *mol* keyword is set to *yes*, then for every atom that is deleted, all other atoms in the same molecule (with the same molecule ID) will also be deleted. This is not done for atoms with molecule ID = 0, since such an ID is assumed to flag isolated atoms that are not part of molecules.

**Note:** The molecule deletion operation in invoked after all individual atoms have been deleted using the rules described above for each style. This means additional atoms may be deleted that are not in the group or region, that are not required by the overlap cutoff criterion, or that will create a higher fraction of porosity than was requested.

### 17.20.4 Restrictions

The *overlap* styles requires inter-processor communication to acquire ghost atoms and build a neighbor list. This means that your system must be ready to perform a simulation before using this command (force fields setup, atom masses set, etc). Since a neighbor list is used to find overlapping atom pairs, it also means that you must define a *pair style* with the minimum force cutoff distance between any pair of atoms types (plus the *neighbor skin*) >= the specified overlap cutoff.

If the *special_bonds* command is used with a setting of 0, then a pair of bonded atoms (1-2, 1-3, or 1-4) will not appear in the neighbor list, and thus will not be considered for deletion by the *overlap* styles. You probably don’t want to be deleting one atom in a bonded pair anyway.

The *bond yes* option cannot be used with molecular systems defined using molecule template files via the *molecule* and *atom_style template* commands.

### 17.20.5 Related commands

`create_atoms`, `reset_atom_ids`

### 17.20.6 Default

The option defaults are *compress = yes*, *bond = no*, *mol = no*.

### 17.21 delete_bonds command

#### 17.21.1 Syntax

```
depete_bonds group-ID style arg keyword ...
```

- **group-ID** = group ID
- **style** = *multi* or *atom* or *bond* or *angle* or *dihedral* or *improper* or *stats*
  - *multi* arg = none
  - *atom* arg = an atom type or range of types (see below)
  - *bond* arg = a bond type or range of types (see below)
  - *angle* arg = an angle type or range of types (see below)
  - *dihedral* arg = a dihedral type or range of types (see below)
  - *improper* arg = an improper type or range of types (see below)
  - *stats* arg = none
17.21.2 Examples

```
delete_bonds frozen multi remove
delete_bonds all atom 4 special
delete_bonds all bond 0*3 special
delete_bonds all stats
```

17.21.3 Description

Turn off (or on) molecular topology interactions, i.e. bonds, angles, dihedrals, impropers. This command is useful for deleting interactions that have been previously turned off by bond-breaking potentials. It is also useful for turning off topology interactions between frozen or rigid atoms. Pairwise interactions can be turned off via the `neigh_modify exclude` command. The `fix shake` command also effectively turns off certain bond and angle interactions.

For all styles, by default, an interaction is only turned off (or on) if all the atoms involved are in the specified group. See the `any` keyword to change the behavior.

Several of the styles (atom, bond, angle, dihedral, improper) take a type as an argument. The specified type should be an integer from 0 to N, where N is the number of relevant types (atom types, bond types, etc). A value of 0 is only relevant for style bond; see details below. In all cases, a wildcard asterisk can be used in place of or in conjunction with the type argument to specify a range of types. This takes the form “*” or “*n” or “n*” or “m*n”. If N = the number of types, then an asterisk with no numeric values means all types from 0 to N. A leading asterisk means all types from 0 to n (inclusive). A trailing asterisk means all types from n to N (inclusive). A middle asterisk means all types from m to n (inclusive). Note that it is fine to include a type of 0 for non-bond styles; it will simply be ignored.

For style multi all bond, angle, dihedral, and improper interactions of any type, involving atoms in the group, are turned off.

Style atom is the same as style multi except that in addition, one or more of the atoms involved in the bond, angle, dihedral, or improper interaction must also be of the specified atom type.

For style bond, only bonds are candidates for turn-off, and the bond must also be of the specified type. Styles angle, dihedral, and improper are treated similarly.

For style bond, you can set the type to 0 to delete bonds that have been previously broken by a bond-breaking potential (which sets the bond type to 0 when a bond is broken); e.g. see the `bond_style quartic` command.

For style stats no interactions are turned off (or on); the status of all interactions in the specified group is simply reported. This is useful for diagnostic purposes if bonds have been turned off by a bond-breaking potential during a previous run.

The default behavior of the delete_bonds command is to turn off interactions by toggling their type to a negative value, but not to permanently remove the interaction. E.g. a bond_type of 2 is set to -2. The neighbor list creation routines will not include such an interaction in their interaction lists. The default is also to not alter the list of 1-2, 1-3, 1-4 neighbors computed by the special_bonds command and used to weight pairwise force and energy calculations. This means that pairwise computations will proceed as if the bond (or angle, etc) were still turned on.

Several keywords can be appended to the argument list to alter the default behaviors.

The any keyword changes the requirement that all atoms in the bond (angle, etc) must be in the specified group in order to turn-off the interaction. Instead, if any of the atoms in the interaction are in the specified group, it will be turned off (or on if the undo keyword is used).
The *undo* keyword inverts the delete_bonds command so that the specified bonds, angles, etc are turned on if they are currently turned off. This means a negative value is toggled to positive. For example, for style angle, if type is specified as 2, then all angles with current type = -2, are reset to type = 2. Note that the *fix shake* command also sets bond and angle types negative, so this option should not be used on those interactions.

The *remove* keyword is invoked at the end of the delete_bonds operation. It causes turned-off bonds (angles, etc) to be removed from each atom’s data structure and then adjusts the global bond (angle, etc) counts accordingly. Removal is a permanent change; removed bonds cannot be turned back on via the *undo* keyword. Removal does not alter the pairwise 1-2, 1-3, 1-4 weighting list.

The *special* keyword is invoked at the end of the delete_bonds operation, after (optional) removal. It re-computes the pairwise 1-2, 1-3, 1-4 weighting list. The weighting list computation treats turned-off bonds the same as turned-on. Thus, turned-off bonds must be removed if you wish to change the weighting list.

Note that the choice of *remove* and *special* options affects how 1-2, 1-3, 1-4 pairwise interactions will be computed across bonds that have been modified by the delete_bonds command.

### 17.21.4 Restrictions

This command requires inter-processor communication to acquire ghost atoms, to coordinate the deleting of bonds, angles, etc between atoms shared by multiple processors. This means that your system must be ready to perform a simulation before using this command (force fields setup, atom masses set, etc). Just as would be needed to run dynamics, the force field you define should define a cutoff (e.g. through a *pair_style* command) which is long enough for a processor to acquire the ghost atoms it’s needs to compute bond, angle, etc interactions.

If deleted bonds (angles, etc) are removed but the 1-2, 1-3, 1-4 weighting list is not re-computed, this can cause a later *fix shake* command to fail due to an atom’s bonds being inconsistent with the weighting list. This should only happen if the group used in the fix command includes both atoms in the bond, in which case you probably should be recomputing the weighting list.

### 17.21.5 Related commands

*neigh_modify* exclude, *special_bonds*, *fix shake*

### 17.21.6 Default

*none*

### 17.22 dielectric command

#### 17.22.1 Syntax

```plaintext

dielectric value
```

- value = dielectric constant
17.22.2 Examples

```plaintext
dielectric 2.0
```

17.22.3 Description

Set the dielectric constant for Coulombic interactions (pairwise and long-range) to this value. The constant is unitless, since it is used to reduce the strength of the interactions. The value is used in the denominator of the formulas for Coulombic interactions - e.g. a value of 4.0 reduces the Coulombic interactions to 25% of their default strength. See the `pair_style` command for more details.

17.22.4 Restrictions

none

17.22.5 Related commands

`pair_style`

17.22.6 Default

```plaintext
dielectric 1.0
```

17.23 dihedral_coeff command

17.23.1 Syntax

```plaintext
dihedral_coeff N args
```

- N = dihedral type (see asterisk form below)
- args = coefficients for one or more dihedral types

17.23.2 Examples

```plaintext
dihedral_coeff 1 80.0 1 3
dihedral_coeff * 80.0 1 3 0.5
dihedral_coeff 2* 80.0 1 3 0.5
```
17.23.3 Description

Specify the dihedral force field coefficients for one or more dihedral types. The number and meaning of the coefficients depends on the dihedral style. Dihedral coefficients can also be set in the data file read by the `read_data` command or in a restart file.

N can be specified in one of two ways. An explicit numeric value can be used, as in the first example above. Or a wild-card asterisk can be used to set the coefficients for multiple dihedral types. This takes the form "*" or "*n" or "n*" or "m*n". If N = the number of dihedral types, then an asterisk with no numeric values means all types from 1 to N. A leading asterisk means all types from 1 to n (inclusive). A trailing asterisk means all types from n to N (inclusive). A middle asterisk means all types from m to n (inclusive).

Note that using a `dihedral_coeff` command can override a previous setting for the same dihedral type. For example, these commands set the coeffs for all dihedral types, then overwrite the coeffs for just dihedral type 2:

```
dihedral_coeff * 80.0 1 3
dihedral_coeff 2 200.0 1 3
```

A line in a data file that specifies dihedral coefficients uses the exact same format as the arguments of the `dihedral_coeff` command in an input script, except that wild-card asterisks should not be used since coefficients for all N types must be listed in the file. For example, under the “Dihedral Coeffs” section of a data file, the line that corresponds to the first example above would be listed as

```
1 80.0 1 3
```

The `dihedral_style class2` is an exception to this rule, in that an additional argument is used in the input script to allow specification of the cross-term coefficients. See its doc page for details.

**Note:** When comparing the formulas and coefficients for various LAMMPS dihedral styles with dihedral equations defined by other force fields, note that some force field implementations divide/multiply the energy prefactor $K$ by the multiple number of torsions that contain the J-K bond in an I-J-K-L torsion. LAMMPS does not do this, i.e. the listed dihedral equation applies to each individual dihedral. Thus you need to define $K$ appropriately to account for this difference if necessary.

The list of all dihedral styles defined in LAMMPS is given on the `dihedral_style` doc page. They are also listed in more compact form on the Commands dihedral doc page.

On either of those pages, click on the style to display the formula it computes and its coefficients as specified by the associated dihedral_coeff command.

17.23.4 Restrictions

This command must come after the simulation box is defined by a `read_data`, `read_restart`, or `create_box` command.

A dihedral style must be defined before any dihedral coefficients are set, either in the input script or in a data file.
17.23.5 Related commands

dihedral_style

17.23.6 Default

none

17.24 dihedral_style command

17.24.1 Syntax

```
dihedral_style style
```

- `style = none` or `hybrid` or `charm` or `class2` or `harmonic` or `helix` or `multi/harmonic` or `opls`

17.24.2 Examples

```
dihedral_style harmonic
dihedral_style multi/harmonic
```

17.24.3 Description

Set the formula(s) LAMMPS uses to compute dihedral interactions between quadruplets of atoms, which remain in force for the duration of the simulation. The list of dihedral quadruplets is read in by a `read_data` or `read_restart` command from a data or restart file.

Hybrid models where dihedrals are computed using different dihedral potentials can be setup using the `hybrid` dihedral style.

The coefficients associated with a dihedral style can be specified in a data or restart file or via the `dihedral_coeff` command.

All dihedral potentials store their coefficient data in binary restart files which means dihedral_style and `dihedral_coeff` commands do not need to be re-specified in an input script that restarts a simulation. See the `read_restart` command for details on how to do this. The one exception is that dihedral_style `hybrid` only stores the list of sub-styles in the restart file; dihedral coefficients need to be re-specified.

Note: When both a dihedral and pair style is defined, the `special_bonds` command often needs to be used to turn off (or weight) the pairwise interaction that would otherwise exist between 4 bonded atoms.

In the formulas listed for each dihedral style, `phi` is the torsional angle defined by the quadruplet of atoms. This angle has a sign convention as shown in this diagram:
where the I,J,K,L ordering of the 4 atoms that define the dihedral is from left to right.

This sign convention effects several of the dihedral styles listed below (e.g. charmm, helix) in the sense that the energy formula depends on the sign of phi, which may be reflected in the value of the coefficients you specify.

Note: When comparing the formulas and coefficients for various LAMMPS dihedral styles with dihedral equations defined by other force fields, note that some force field implementations divide/multiply the energy prefactor $K$ by the multiple number of torsions that contain the J-K bond in an I-J-K-L torsion. LAMMPS does not do this, i.e. the listed dihedral equation applies to each individual dihedral. Thus you need to define $K$ appropriately via the $\textit{dihedral_coeff}$ command to account for this difference if necessary.

Here is an alphabetic list of dihedral styles defined in LAMMPS. Click on the style to display the formula it computes and coefficients specified by the associated $\textit{dihedral_coeff}$ command.

Click on the style to display the formula it computes, any additional arguments specified in the dihedral_style command, and coefficients specified by the associated $\textit{dihedral_coeff}$ command.

There are also additional accelerated pair styles included in the LAMMPS distribution for faster performance on CPUs, GPUs, and KNLs. The individual style names on the $\textit{Commands dihedral}$ doc page are followed by one or more of (g,i,k,o,t) to indicate which accelerated styles exist.

- $\textit{none}$ - turn off dihedral interactions
- $\textit{zero}$ - topology but no interactions
- $\textit{hybrid}$ - define multiple styles of dihedral interactions
- $\textit{charmm}$ - CHARMM dihedral
- $\textit{charmmfsw}$ - CHARMM dihedral with force switching
- $\textit{class2}$ - COMPASS (class 2) dihedral
- $\textit{cosine/shift/exp}$ - dihedral with exponential in spring constant
- $\textit{fourier}$ - dihedral with multiple cosine terms
- $\textit{harmonic}$ - harmonic dihedral
- $\textit{helix}$ - helix dihedral
- $\textit{multi/harmonic}$ - dihedral with 5 harmonic terms
- $\textit{nharmonic}$ - same as multi-harmonic with N terms
- $\textit{opls}$ - OPLS dihedral
- $\textit{quadratic}$ - dihedral with quadratic term in angle
- $\textit{spherical}$ - dihedral which includes angle terms to avoid singularities
- $\textit{table}$ - tabulated dihedral
17.24.4 Restrictions

Dihedral styles can only be set for atom styles that allow dihedrals to be defined.

Most dihedral styles are part of the MOLECULE package. They are only enabled if LAMMPS was built with that package. See the Build package doc page for more info. The doc pages for individual dihedral potentials tell if it is part of a package.

17.24.5 Related commands

17.25 dimension command

17.25.1 Syntax

dimension N

- N = 2 or 3

17.25.2 Examples

dimension 2

17.25.3 Description

Set the dimensionality of the simulation. By default LAMMPS runs 3d simulations. To run a 2d simulation, this command should be used prior to setting up a simulation box via the create_box or read_data commands. Restart files also store this setting.

See the discussion on the Howto 2d doc page for additional instructions on how to run 2d simulations.

Note: Some models in LAMMPS treat particles as finite-size spheres or ellipsoids, as opposed to point particles. In 2d, the particles will still be spheres or ellipsoids, not circular disks or ellipses, meaning their moment of inertia will be the same as in 3d.
17.25.4 Restrictions

This command must be used before the simulation box is defined by a `read_data` or `create_box` command.

17.25.5 Related commands

17.26.1 Syntax

```plaintext
displace_atoms group-ID style args keyword value ...
```

- group-ID = ID of group of atoms to displace
- style = `move` or `ramp` or `random` or `rotate`
  - `move` args = delx dely delz
    - delx, dely, delz = distance to displace in each dimension (distance units)
    - any of delx, dely, delz can be a variable (see below)
  - `ramp` args = ddim dlo dhi dim clo chi
    - ddim = x or y or z
    - dlo, dhi = displacement distance between dlo and dhi (distance units)
    - dim = x or y or z
    - clo, chi = lower and upper bound of domain to displace (distance units)
  - `random` args = dx dy dz seed
    - dx, dy, dz = random displacement magnitude in each dimension (distance units)
    - seed = random # seed (positive integer)
  - `rotate` args = Px Py Pz Rx Ry Rz theta
    - Px, Py, Pz = origin point of axis of rotation (distance units)
    - Rx, Ry, Rz = axis of rotation vector
    - theta = angle of rotation (degrees)

- zero or more keyword/value pairs may be appended
  - keyword = `units`
  - value = `box` or `lattice`
17.26.2 Examples

```
displace_atoms top move 0 -5 0 units box

displace_atoms flow ramp x 0.0 5.0 y 2.0 20.5
```

17.26.3 Description

Displace a group of atoms. This can be used to move atoms a large distance before beginning a simulation or to randomize atoms initially on a lattice. For example, in a shear simulation, an initial strain can be imposed on the system. Or two groups of atoms can be brought into closer proximity.

The move style displaces the group of atoms by the specified 3d displacement vector. Any of the 3 quantities defining the vector components can be specified as an equal-style or atom-style variable. If the value is a variable, it should be specified as v_name, where name is the variable name. In this case, the variable will be evaluated, and its value(s) used for the displacement(s). The scale factor implied by the units keyword will also be applied to the variable result.

Equal-style variables can specify formulas with various mathematical functions, and include thermo_style command keywords for the simulation box parameters and timestep and elapsed time. Atom-style variables can specify the same formulas as equal-style variables but can also include per-atom values, such as atom coordinates or per-atom values read from a file. Note that if the variable references other compute or fix commands, those values must be up-to-date for the current timestep. See the “Variable Accuracy” section of the variable doc page for more details.

The ramp style displaces atoms a variable amount in one dimension depending on the atom’s coordinate in a (possibly) different dimension. For example, the second example command displaces atoms in the x-direction an amount between 0.0 and 5.0 distance units. Each atom’s displacement depends on the fractional distance its y coordinate is between 2.0 and 20.5. Atoms with y-coordinates outside those bounds will be moved the minimum (0.0) or maximum (5.0) amount.

The random style independently moves each atom in the group by a random displacement, uniformly sampled from a value between -dx and +dx in the x dimension, and similarly for y and z. Random numbers are used in such a way that the displacement of a particular atom is the same, regardless of how many processors are being used.

The rotate style rotates each atom in the group by the angle theta around a rotation axis \( R \) that goes through a point \( P = (P_x,P_y,P_z) \). The direction of rotation for the atoms around the rotation axis is consistent with the right-hand rule: if your right-hand thumb points along \( R \), then your fingers wrap around the axis in the direction of positive theta.

If the defined atom_style assigns an orientation to each atom (atom styles ellipsoid, line, tri, body), then that property is also updated appropriately to correspond to the atom’s rotation.

Distance units for displacements and the origin point of the rotate style are determined by the setting of box or lattice for the units keyword. Box means distance units as defined by the units command - e.g. Angstroms for real units. Lattice means distance units are in lattice spacings. The lattice command must have been previously used to define the lattice spacing.

Note: Care should be taken not to move atoms on top of other atoms. After the move, atoms are remapped into the periodic simulation box if needed, and any shrink-wrap boundary conditions (see the boundary command) are enforced which may change the box size. Other than this effect, this command does not change the size or shape of the simulation box. See the change_box command if that effect is desired.

Note: Atoms can be moved arbitrarily long distances by this command. If the simulation box is non-periodic and shrink-wrapped (see the boundary command), this can change its size or shape. This is not a problem, except that the mapping of processors to the simulation box is not changed by this command from its initial 3d configuration; see the
processors command. Thus, if the box size/shape changes dramatically, the mapping of processors to the simulation box may not end up as optimal as the initial mapping attempted to be.

17.26.4 Restrictions

For a 2d simulation, only rotations around the a vector parallel to the z-axis are allowed.

17.35.3 Description

Dump a snapshot of atom quantities to one or more files every N timesteps in one of several styles. The *image* and *movie* styles are the exception: the *image* style renders a JPG, PNG, or PPM image file of the atom configuration every N timesteps while the *movie* style combines and compresses them into a movie file; both are discussed in detail on the *dump image* doc page. The timesteps on which dump output is written can also be controlled by a variable. See the *dump_modify every* command.

Only information for atoms in the specified group is dumped. The *dump_modify thresh* and *region* and *refresh* commands can also alter what atoms are included. Not all styles support these options; see details on the *dump_modify* doc page.

As described below, the filename determines the kind of output (text or binary or gzipped, one big file or one per timestep, one big file or multiple smaller files).

**Note:** Because periodic boundary conditions are enforced only on timesteps when neighbor lists are rebuilt, the coordinates of an atom written to a dump file may be slightly outside the simulation box. Re-neighbor timesteps will not typically coincide with the timesteps dump snapshots are written. See the *dump_modify pbc* command if you wish to force coordinates to be strictly inside the simulation box.

**Note:** Unless the *dump_modify sort* option is invoked, the lines of atom information written to dump files (typically one line per atom) will be in an indeterminate order for each snapshot. This is even true when running on a single processor, if the *atom_modify sort* option is on, which it is by default. In this case atoms are re-ordered periodically during a simulation, due to spatial sorting. It is also true when running in parallel, because data for a single snapshot is collected from multiple processors, each of which owns a subset of the atoms.

For the *atom*, *custom*, *cfg*, and *local* styles, sorting is off by default. For the *dcd*, *xtc*, *xyz*, and *molfile* styles, sorting by atom ID is on by default. See the *dump_modify doc page* for details.

The *atom/gz*, *cfg/gz*, *custom/gz*, *local/gz*, and *xyz/gz* styles are identical in command syntax to the corresponding styles without “gz””, however, they generate compressed files using the zlib library. Thus the filename suffix “.gz” is mandatory. This is an alternative approach to writing compressed files via a pipe, as done by the regular dump styles, which may be required on clusters where the interface to the high-speed network disallows using the fork() library call (which is needed for a pipe). For the remainder of this doc page, you should thus consider the *atom* and *atom/gz* styles (etc) to be inter-changeable, with the exception of the required filename suffix.

Similarly, the *atom/zstd*, *cfg/zstd*, *custom/zstd*, *local/zstd*, and *xyz/zstd* styles are identical to the gz styles, but use the Zstd compression library instead and require the “.zst” suffix. See the *dump_modify* doc page for details on how to control the compression level in both variants.

As explained below, the *atom/mpiio*, *cfg/mpiio*, *custom/mpiio*, and *xyz/mpiio* styles are identical in command syntax and in the format of the dump files they create, to the corresponding styles without “mpiio”, except the single dump file they produce is written in parallel via the MPI-IO library. For the remainder of this doc page, you should thus consider the *atom* and *atom/mpiio* styles (etc) to be inter-changeable. The one exception is how the filename is specified for the MPI-IO styles, as explained below.

The precision of values output to text-based dump files can be controlled by the *dump_modify format* command and its options.

The *style* keyword determines what atom quantities are written to the file and in what format. Settings made via the *dump_modify* command can also alter the format of individual values and the file itself.
The `atom`, `local`, and `custom` styles create files in a simple text format that is self-explanatory when viewing a dump file. Some of the LAMMPS post-processing tools described on the `Tools` doc page, including `Pizza.py`, work with this format, as does the `rerun` command.

For post-processing purposes the `atom`, `local`, and `custom` text files are self-describing in the following sense.

The dimensions of the simulation box are included in each snapshot. For an orthogonal simulation box this information is formatted as:

```
ITEM: BOX BOUNDS xx yy zz
xlo xhi
ylo yhi
zlo zhi
```

where xlo, xhi are the maximum extents of the simulation box in the x-dimension, and similarly for y and z. The “xx yy zz” represent 6 characters that encode the style of boundary for each of the 6 simulation box boundaries (xlo,xhi and ylo,yhi and zlo,zhi). Each of the 6 characters is either p = periodic, f = fixed, s = shrink wrap, or m = shrink wrapped with a minimum value. See the `boundary` command for details.

For triclinic simulation boxes (non-orthogonal), an orthogonal bounding box which encloses the triclinic simulation box is output, along with the 3 tilt factors (xy, xz, yz) of the triclinic box, formatted as follows:

```
ITEM: BOX BOUNDS xy xz yz xx yy zz
xlo_bound xhi_bound xy
ylo_bound yhi_bound xz
zlo_bound zhi_bound yz
```

The presence of the text “xy xz yz” in the ITEM line indicates that the 3 tilt factors will be included on each of the 3 following lines. This bounding box is convenient for many visualization programs. The meaning of the 6 character flags for “xx yy zz” is the same as above.

Note that the first two numbers on each line are now xlo_bound instead of xlo, etc, since they represent a bounding box. See the `Howto triclinic` doc page for a geometric description of triclinic boxes, as defined by LAMMPS, simple formulas for how the 6 bounding box extents (xlo_bound,xhi_bound,etc) are calculated from the triclinic parameters, and how to transform those parameters to and from other commonly used triclinic representations.

The “ITEM: ATOMS” line in each snapshot lists column descriptors for the per-atom lines that follow. For example, the descriptors would be “id type xs ys zs” for the default `atom` style, and would be the atom attributes you specify in the dump command for the `custom` style.

For style `atom`, atom coordinates are written to the file, along with the atom ID and atom type. By default, atom coords are written in a scaled format (from 0 to 1). I.e. an x value of 0.25 means the atom is at a location 1/4 of the distance from xlo to xhi of the box boundaries. The format can be changed to unscaled coords via the `dump_modify` settings.

Image flags can also be added for each atom via `dump_modify`.

Style `custom` allows you to specify a list of atom attributes to be written to the dump file for each atom. Possible attributes are listed above and will appear in the order specified. You cannot specify a quantity that is not defined for a particular simulation - such as q for atom style `bond`, since that atom style does not assign charges. Dumps occur at the very end of a timestep, so atom attributes will include effects due to fixes that are applied during the timestep. An explanation of the possible dump custom attributes is given below.

For style `local`, local output generated by `computes` and `fixes` is used to generate lines of output that is written to the dump file. This local data is typically calculated by each processor based on the atoms it owns, but there may be zero or more entities per atom, e.g. a list of bond distances. An explanation of the possible dump local attributes is given below. Note that by using input from the `compute property/local` command with `dump local`, it is possible to generate information on bonds, angles, etc that can be cut and pasted directly into a data file read by the `read_data` command.

Style `cfg` has the same command syntax as style `custom` and writes extended CFG format files, as used by the `AtomEye` visualization package. Since the extended CFG format uses a single snapshot of the system per file, a wildcard “*”
must be included in the filename, as discussed below. The list of atom attributes for style cfg must begin with either “mass type xs ys zs” or “mass type xsu ysu zsu” since these quantities are needed to write the CFG files in the appropriate format (though the “mass” and “type” fields do not appear explicitly in the file). Any remaining attributes will be stored as “auxiliary properties” in the CFG files. Note that you will typically want to use the dump_modify element command with CFG-formatted files, to associate element names with atom types, so that AtomEye can render atoms appropriately. When unwrapped coordinates xsu, ysu, and zsu are requested, the nominal AtomEye periodic cell dimensions are expanded by a large factor UNWRAPEXPAND = 10.0, which ensures atoms that are displayed correctly for up to UNWRAPEXPAND/2 periodic boundary crossings in any direction. Beyond this, AtomEye will rewrap the unwrapped coordinates. The expansion causes the atoms to be drawn farther away from the viewer, but it is easy to zoom the atoms closer, and the interatomic distances are unaffected.

The dcd style writes DCD files, a standard atomic trajectory format used by the CHARMM, NAMD, and XPlor molecular dynamics packages. DCD files are binary and thus may not be portable to different machines. The number of atoms per snapshot cannot change with the dcd style. The unwrap option of the dump_modify command allows DCD coordinates to be written “unwrapped” by the image flags for each atom. Unwrapped means that if the atom has passed through a periodic boundary one or more times, the value is printed for what the coordinate would be if it had not been wrapped back into the periodic box. Note that these coordinates may thus be far outside the box size stored with the snapshot.

The xtc style writes XTC files, a compressed trajectory format used by the GROMACS molecular dynamics package, and described here. The precision used in XTC files can be adjusted via the dump_modify command. The default value of 1000 means that coordinates are stored to 1/1000 nanometer accuracy. XTC files are portable binary files written in the NFS XDR data format, so that any machine which supports XDR should be able to read them. The number of atoms per snapshot cannot change with the xtc style. The unwrap option of the dump_modify command allows XTC coordinates to be written “unwrapped” by the image flags for each atom. Unwrapped means that if the atom has passed through a periodic boundary one or more times, the value is printed for what the coordinate would be if it had not been wrapped back into the periodic box. Note that these coordinates may thus be far outside the box size stored with the snapshot.

The xyz style writes XYZ files, which is a simple text-based coordinate format that many codes can read. Specifically it has a line with the number of atoms, then a comment line that is usually ignored followed by one line per atom with the atom type and the x-, y-, and z-coordinate of that atom. You can use the dump_modify element option to change the output from using the (numerical) atom type to an element name (or some other label). This will help many visualization programs to guess bonds and colors.

Note that atom, custom, dcd, xtc, and xyz style dump files can be read directly by VMD, a popular molecular viewing program.

Dumps are performed on timesteps that are a multiple of N (including timestep 0) and on the last timestep of a minimization if the minimization converges. Note that this means a dump will not be performed on the initial timestep after the dump command is invoked, if the current timestep is not a multiple of N. This behavior can be changed via the dump_modify first command, which can also be useful if the dump command is invoked after a minimization ended on an arbitrary timestep. N can be changed between runs by using the dump_modify every command (not allowed for dcd style). The dump_modify every command also allows a variable to be used to determine the sequence of timesteps on which dump files are written. In this mode a dump on the first timestep of a run will also not be written unless the dump_modify first command is used.

The specified filename determines how the dump file(s) is written. The default is to write one large text file, which is opened when the dump command is invoked and closed when an undump command is used or when LAMMPS exits. For the dcd and xtc styles, this is a single large binary file.

Dump filenames can contain two wildcard characters. If a “*” character appears in the filename, then one file per snapshot is written and the “*” character is replaced with the timestep value. For example, tmp.dump.* becomes tmp.dump.0, tmp.dump.10000, tmp.dump.20000, etc. This option is not available for the dcd and xtc styles. Note that the dump_modify pad command can be used to insure all timestep numbers are the same length (e.g. 00010), which can make it easier to read a series of dump files in order with some post-processing tools.

17.35. dump custom/adios command
If a “%” character appears in the filename, then each of P processors writes a portion of the dump file, and the “%” character is replaced with the processor ID from 0 to P-1. For example, tmp.dump.% becomes tmp.dump.0, tmp.dump.1, ... tmp.dump.P-1, etc. This creates smaller files and can be a fast mode of output on parallel machines that support parallel I/O for output. This option is not available for the dcd, xtc, and xyz styles.

By default, P = the number of processors meaning one file per processor, but P can be set to a smaller value via the nfile or fileper keywords of the dump_modify command. These options can be the most efficient way of writing out dump files when running on large numbers of processors.

Note that using the “*” and “%” characters together can produce a large number of small dump files!

For the atom/mpiio, cfg/mpiio, custom/mpiio, and xyz/mpiio styles, a single dump file is written in parallel via the MPI-IO library, which is part of the MPI standard for versions 2.0 and above. Using MPI-IO requires two steps. First, build LAMMPS with its MPIIO package installed, e.g.

```
make yes-mpiio  # installs the MPIIO package
make mpi        # build LAMMPS for your platform
```

Second, use a dump filename which contains “.mpiio”. Note that it does not have to end in “.mpiio”, just contain those characters. Unlike MPI-IO restart files, which must be both written and read using MPI-IO, the dump files produced by these MPI-IO styles are identical in format to the files produced by their non-MPI-IO style counterparts. This means you can write a dump file using MPI-IO and use the read_dump command or perform other post-processing, just as if the dump file was not written using MPI-IO.

Note that MPI-IO dump files are one large file which all processors write to. You thus cannot use the “%” wildcard character described above in the filename since that specifies generation of multiple files. You can use the “.bin” suffix described below in an MPI-IO dump file; again this file will be written in parallel and have the same binary format as if it were written without MPI-IO.

If the filename ends with “.bin”, the dump file (or files, if “*” or “%” is also used) is written in binary format. A binary dump file will be about the same size as a text version, but will typically write out much faster. Of course, when post-processing, you will need to convert it back to text format (see the binary2txt tool) or write your own code to read the binary file. The format of the binary file can be understood by looking at the tools/binary2txt.cpp file. This option is only available for the atom and custom styles.

If the filename ends with “.gz”, the dump file (or files, if “*” or “%” is also used) is written in gzipped format. A gzipped dump file will be about 3x smaller than the text version, but will also take longer to write. This option is not available for the dcd and xtc styles.

Note that in the discussion which follows, for styles which can reference values from a compute or fix, like the custom, cfg, or local styles, the bracketed index I can be specified using a wildcard asterisk with the index to effectively specify multiple values. This takes the form “*” or “*n” or “n*” or “m*n”. If N = the size of the vector (for mode = scalar) or the number of columns in the array (for mode = vector), then an asterisk with no numeric values means all indices from 1 to N. A leading asterisk means all indices from 1 to n (inclusive). A trailing asterisk means all indices from n to N (inclusive). A middle asterisk means all indices from m to n (inclusive).

Using a wildcard is the same as if the individual columns of the array had been listed one by one. E.g. these 2 dump commands are equivalent, since the compute stress/atom command creates a per-atom array with 6 columns:

```
compute myPress all stress/atom NULL
dump 2 all custom 100 tmp.dump id myPress[*]
```

This section explains the local attributes that can be specified as part of the local style.
The *index* attribute can be used to generate an index number from 1 to N for each line written into the dump file, where N is the total number of local datums from all processors, or lines of output that will appear in the snapshot. Note that because data from different processors depend on what atoms they currently own, and atoms migrate between processor, there is no guarantee that the same index will be used for the same info (e.g. a particular bond) in successive snapshots.

The *c_ID* and *c_ID[I]* attributes allow local vectors or arrays calculated by a *compute* to be output. The ID in the attribute should be replaced by the actual ID of the compute that has been defined previously in the input script. See the *compute* command for details. There are computes for calculating local information such as indices, types, and energies for bonds and angles.

Note that computes which calculate global or per-atom quantities, as opposed to local quantities, cannot be output in a dump local command. Instead, global quantities can be output by the *thermo_style custom* command, and per-atom quantities can be output by the dump custom command.

If *c_ID* is used as a attribute, then the local vector calculated by the compute is printed. If *c_ID[I]* is used, then I must be in the range from 1-M, which will print the Ith column of the local array with M columns calculated by the compute. See the discussion above for how I can be specified with a wildcard asterisk to effectively specify multiple values.

The *f_ID* and *f_ID[I]* attributes allow local vectors or arrays calculated by a *fix* to be output. The ID in the attribute should be replaced by the actual ID of the fix that has been defined previously in the input script.

If *f_ID* is used as a attribute, then the local vector calculated by the fix is printed. If *f_ID[I]* is used, then I must be in the range from 1-M, which will print the Ith column of the local with M columns calculated by the fix. See the discussion above for how I can be specified with a wildcard asterisk to effectively specify multiple values.

Here is an example of how to dump bond info for a system, including the distance and energy of each bond:

```plaintext
compute 1 all property/local batom1 batom2 btype
compute 2 all bond/local dist eng
```

This section explains the atom attributes that can be specified as part of the *custom* and *cfg* styles. The *id*, *mol*, *proc*, *procP1*, *type*, *element*, *mass*, *vx*, *vy*, *vz*, *fx*, *fy*, *fz*, *q* attributes are self-explanatory.

*Id* is the atom ID. *Mol* is the molecule ID, included in the data file for molecular systems. *Proc* is the ID of the processor (0 to Nprocs-1) that currently owns the atom. *ProcP1* is the proc ID+1, which can be convenient in place of a *type* attribute (1 to Ntypes) for coloring atoms in a visualization program. *Type* is the atom type (1 to Ntypes). *Element* is typically the chemical name of an element, which you must assign to each type via the *dump_modify element* command. More generally, it can be any string you wish to associate with an atom type. *Mass* is the atom mass. *Vx*, *vy*, *vz*, *fx*, *fy*, *fz*, and *q* are components of atom velocity and force and atomic charge.

There are several options for outputting atom coordinates. The *x*, *y*, *z* attributes write atom coordinates “unscaled”, in the appropriate distance *units* (Angstroms, sigma, etc). Use *xs*, *ys*, *zs* if you want the coordinates “scaled” to the box size, so that each value is 0.0 to 1.0. If the simulation box is triclinic (tilted), then all atom coords will still be between 0.0 and 1.0. I.e. actual unscaled *(x,y,z) = xs*A + ys*B + zs*C*, where *(A,B,C)* are the non-orthogonal vectors of the simulation box edges, as discussed on the *Howto triclinic* doc page.

Use *xu*, *yu*, *zu* if you want the coordinates “unwrapped” by the image flags for each atom. Unwrapped means that if the atom has passed through a periodic boundary one or more times, the value is printed for what the coordinate would be if it had not been wrapped back into the periodic box. Note that using *xu*, *yu*, *zu* means that the coordinate values may be far outside the box bounds printed with the snapshot. Using *xu*, *yu*, *zu* is similar to using *xs*, *ys*, *zs*, except that the unwrapped coordinates are scaled by the box size. Atoms that have passed through a periodic boundary will have the corresponding coordinate increased or decreased by 1.0.

The image flags can be printed directly using the *ix*, *iy*, *iz* attributes. For periodic dimensions, they specify which image of the simulation box the atom is considered to be in. An image of 0 means it is inside the box as defined. A
value of 2 means add 2 box lengths to get the true value. A value of -1 means subtract 1 box length to get the true value. LAMMPS updates these flags as atoms cross periodic boundaries during the simulation.

The $mu_x$, $mu_y$, $mu_z$ attributes are specific to dipolar systems defined with an atom style of dipole. They give the orientation of the atom’s point dipole moment. The $mu$ attribute gives the magnitude of the atom’s dipole moment.

The $radius$ and $diameter$ attributes are specific to spherical particles that have a finite size, such as those defined with an atom style of sphere.

The $omega_x$, $omega_y$, and $omega_z$ attributes are specific to finite-size spherical particles that have an angular velocity. Only certain atom styles, such as sphere define this quantity.

The $angmom_x$, $angmom_y$, and $angmom_z$ attributes are specific to finite-size aspherical particles that have an angular momentum. Only the ellipsoid atom style defines this quantity.

The $tau_x$, $tau_y$, $tau_z$ attributes are for finite-size particles that can sustain a rotational torque due to interactions with other particles.

The $c_{ID}$ and $c_{ID}[I]$ attributes allow per-atom vectors or arrays calculated by a compute to be output. The ID in the attribute should be replaced by the actual ID of the compute that has been defined previously in the input script. See the compute command for details. There are computes for calculating the per-atom energy, stress, centro-symmetry parameter, and coordination number of individual atoms.

Note that computes which calculate global or local quantities, as opposed to per-atom quantities, cannot be output in a dump custom command. Instead, global quantities can be output by the thermo_style custom command, and local quantities can be output by the dump local command.

If $c_{ID}$ is used as a attribute, then the per-atom vector calculated by the compute is printed. If $c_{ID}[I]$ is used, then I must be in the range from 1-M, which will print the Ith column of the per-atom array with M columns calculated by the compute. See the discussion above for how I can be specified with a wildcard asterisk to effectively specify multiple values.

The $f_{ID}$ and $f_{ID}[I]$ attributes allow vector or array per-atom quantities calculated by a fix to be output. The ID in the attribute should be replaced by the actual ID of the fix that has been defined previously in the input script. The fix ave/atom command is one that calculates per-atom quantities. Since it can time-average per-atom quantities produced by any compute, fix, or atom-style variable, this allows those time-averaged results to be written to a dump file.

If $f_{ID}$ is used as a attribute, then the per-atom vector calculated by the fix is printed. If $f_{ID}[I]$ is used, then I must be in the range from 1-M, which will print the Ith column of the per-atom array with M columns calculated by the fix. See the discussion above for how I can be specified with a wildcard asterisk to effectively specify multiple values.

The $v_{name}$ attribute allows per-atom vectors calculated by a variable to be output. The name in the attribute should be replaced by the actual name of the variable that has been defined previously in the input script. Only an atom-style variable can be referenced, since it is the only style that generates per-atom values. Variables of style atom can reference individual atom attributes, per-atom attributes, thermodynamic keywords, or invoke other computes, fixes, or variables when they are evaluated, so this is a very general means of creating quantities to output to a dump file.

The $d_{name}$ and $i_{name}$ attributes allow to output custom per atom floating point or integer properties that are managed by fix property/atom.

See the Modify doc page for information on how to add new compute and fix styles to LAMMPS to calculate per-atom quantities which could then be output into dump files.
17.35.4 Restrictions

To write gzipped dump files, you must either compile LAMMPS with the -DLAMMPS_GZIP option or use the styles from the COMPRESS package. See the Build settings doc page for details.

The atom/gz, cfg/gz, custom/gz, and xyz/gz styles are part of the COMPRESS package. They are only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

The atom/mpiio, cfg/mpiio, custom/mpiio, and xyz/mpiio styles are part of the MPIIO package. They are only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

The xtc style is part of the MISC package. It is only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

17.35.5 Related commands

dump atom/adios, dump custom/adios, dump h5md, dump image, dump molfile, dump_modify, undump

17.35.6 Default

The defaults for the image and movie styles are listed on the dump image doc page.

17.36 dump atom/adios command

17.37 dump custom/adios command

17.37.1 Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dump ID group-ID atom/adios N file.bp</td>
<td></td>
</tr>
<tr>
<td>dump ID group-ID custom/adios N file.bp args</td>
<td></td>
</tr>
</tbody>
</table>

- ID = user-assigned name for the dump
- group-ID = ID of the group of atoms to be imaged
- adios = style of dump command (other styles atom or cfg or dcd or xtc or xyz or local or custom are discussed on the dump doc page)
- N = dump every this many timesteps
- file.bp = name of file/stream to write to
- args = same options as in *dump custom* command
17.37.2 Examples

```
dump adios1 all atom/adios 100 atoms.bp
dump 4a all custom/adios 100 dump_adios.bp id v_p x y z
dump 2 subgroup custom/adios 100 dump_adios.bp mass type xs ys zs vx vy vz
```

17.37.3 Description

Dump a snapshot of atom coordinates every N timesteps in the ADIOS based “BP” file format, or using different I/O solutions in ADIOS, to a stream that can be read on-line by another program. ADIOS-BP files are binary, portable and self-describing.

**Use from write_dump:**

It is possible to use these dump styles with the `write_dump` command. In this case, the sub-intervals must not be set at all. The `write_dump` command can be used to create a new file at each individual dump.

```
dump 4 all atom/adios 100 dump.bp
write_dump all atom/adios singledump.bp
```

17.37.4 Restrictions

The number of atoms per snapshot CAN change with the adios style. When using the ADIOS tool ‘bpl’ to list the content of a .bp file, bpl will print `__` for the size of the output table indicating that its size is changing every step.

The `atom/adios` and `custom/adios` dump styles are part of the USER-ADIOS package. They are only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

17.37.5 Related commands

`dump, dump_modify, undump`

17.38 `dump cfg/uef command`

17.38.1 Syntax

```
dump ID group-ID cfg/uef N file mass type xs ys zs args
```

- ID = user-assigned name for the dump
- group-ID = ID of the group of atoms to be dumped
- N = dump every this many timesteps
- file = name of file to write dump info to
  - `args` = same as `args` for `dump custom`
17.38.2 Examples

```
dump 1 all cfg/uef 10 dump.1.cfg mass type xs ys zs

dump 2 all cfg/uef 100 dump.2.cfg mass type xs ys zs id c_stress
```

17.38.3 Description

This command is used to dump atomic coordinates in the reference frame of the applied flow field when `fix nvt/uef` or `fix npt/uef` is used. Only the atomic coordinates and frame-invariant scalar quantities will be in the flow frame. If velocities are selected as output, for example, they will not be in the same reference frame as the atomic positions.

17.38.4 Restrictions

This fix is part of the USER-UEF package. It is only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

This command can only be used when `fix nvt/uef` or `fix npt/uef` is active.

17.38.5 Related commands

`dump, fix nvt/uef`

17.38.6 Default

`none`

17.39 dump h5md command

17.39.1 Syntax

```
dump ID group-ID h5md N file.h5 args
```

- `ID` = user-assigned name for the dump
- `group-ID` = ID of the group of atoms to be imaged
- `h5md` = style of dump command (other styles `atom` or `cfg` or `dcd` or `xtc` or `xyz` or `local` or `custom` are discussed on the `dump` doc page)
- `N` = dump every this many timesteps
- `file.h5` = name of file to write to

`args = list of data elements to dump, with their dump "sub-intervals"
position options
image
velocity options
force options
custom options
file_from ID: do not open a new file, re-use the already opened file from
--dump ID`
box value = yes or no
create_group value = yes or no
author value = quoted string

Note that at least one element must be specified and image may only be present if position is specified first.

For the elements position, velocity, force and species, a sub-interval may be specified to write the data only every N_element iterations of the dump (i.e. every N*N_element time steps). This is specified by this option directly following the element declaration:

```
every N_element
```

### 17.39.2 Examples

```
dump h5md1 all h5md 100 dump_h5md.h5 position image
dump h5md1 all h5md 100 dump_h5md.h5 position velocity every 10
dump h5md1 all h5md 100 dump_h5md.h5 velocity author "John Doe"
```

### 17.39.3 Description

Dump a snapshot of atom coordinates every N timesteps in the HDF5 based H5MD file format (de Buyl). HDF5 files are binary, portable and self-describing. This dump style will write only one file, on the root node.

Several dumps may write to the same file, by using file_from and referring to a previously defined dump. Several groups may also be stored within the same file by defining several dumps. A dump that refers (via file_from) to an already open dump ID and that concerns another particle group must specify create_group yes.

Each data element is written every N*N_element steps. For image, no sub-interval is needed as it must be present at the same interval as position. image must be given after position in any case. The box information (edges in each dimension) is stored at the same interval than the position element, if present. Else it is stored every N steps.

**Note:** Because periodic boundary conditions are enforced only on timesteps when neighbor lists are rebuilt, the coordinates of an atom written to a dump file may be slightly outside the simulation box.

**Use from write_dump:**

It is possible to use this dump style with the write_dump command. In this case, the sub-intervals must not be set at all. The write_dump command can be used either to create a new file or to add current data to an existing dump file by using the file_from keyword.

Typically, the species data is fixed. The following two commands store the position data every 100 timesteps, with the image data, and store once the species data in the same file.

```
dump h5md1 all h5md 100 dump.h5 position image
write_dump all h5md dump.h5 file_from h5md1 species
```
17.39.4 Restrictions

The number of atoms per snapshot cannot change with the h5md style. The position data is stored wrapped (box boundaries not enforced, see note above). Only orthogonal domains are currently supported. This is a limitation of the present dump h5md command and not of H5MD itself.

The h5md dump style is part of the USER-H5MD package. It is only enabled if LAMMPS was built with that package. See the Build package doc page for more info. It also requires (i) building the ch5md library provided with LAMMPS (See the Build package doc page for more info.) and (ii) having the HDF5 library installed (C bindings are sufficient) on your system. The library ch5md is compiled with the h5cc wrapper provided by the HDF5 library.

17.40 dump image command

17.41 dump movie command

17.41.1 Syntax

dump ID group-ID style N file color diameter keyword value ...

• ID = user-assigned name for the dump
• group-ID = ID of the group of atoms to be imaged
• style = image or movie = style of dump command (other styles atom or cfg or dcd or xtc or xyz or local or custom are discussed on the dump doc page)
• N = dump every this many timesteps
• file = name of file to write image to
• color = atom attribute that determines color of each atom
• diameter = atom attribute that determines size of each atom
• zero or more keyword/value pairs may be appended
• keyword = atom or adiam or bond or line or tri or body or fix or size or view or center or up or zoom or persp or box or axes or subbox or shiny or ssao

  atom = yes/no = do or do not draw atoms
  adiam size = numeric value for atom diameter (distance units)
  bond values = color width = color and width of bonds
  color = atom or type or none
  width = number or atom or type or none
  number = numeric value for bond width (distance units)
line = color width
   color = type
   width = numeric value for line width (distance units)
tri = color tflag width
   color = type
   tflag = 1 for just triangle, 2 for just tri edges, 3 for both
   width = numeric value for triangle edge width (distance units)
body = color bflag1 bflag2
   color = type
   bflag1, bflag2 = 2 numeric flags to affect how bodies are drawn
fix = fixID color fflag1 fflag2
   fixID = ID of fix that generates objects to draw
   color = type
   fflag1, fflag2 = 2 numeric flags to affect how fix objects are drawn
size values = width height = size of images
   width = width of image in # of pixels
   height = height of image in # of pixels
view values = theta phi = view of simulation box
   theta = view angle from +z axis (degrees)
   phi = azimuthal view angle (degrees)
   theta or phi can be a variable (see below)
center values = flag Cx Cy Cz = center point of image
   flag = "s" for static, "d" for dynamic
   Cx, Cy, Cz = center point of image as fraction of box dimension (0.5 = center of box)
   Cx, Cy, Cz can be variables (see below)
up values = Ux Uy Uz = direction that is "up" in image
   Ux, Uy, Uz = components of up vector
   Ux, Uy, Uz can be variables (see below)
zoom value = zfactor = size that simulation box appears in image
   zfactor = scale image size by factor > 1 to enlarge, factor < 1 to shrink
   zfactor can be a variable (see below)
persp value = pfactor = amount of "perspective" in image
   pfactor = amount of perspective (0 = none, < 1 = some, > 1 = highly skewed)
   pfactor can be a variable (see below)
box values = yes/no diam = draw outline of simulation box
   yes/no = do or do not draw simulation box lines
   diam = diameter of box lines as fraction of shortest box length
axes values = yes/no length diam = draw xyz axes
   yes/no = do or do not draw xyz axes lines next to simulation box
   length = length of axes lines as fraction of respective box lengths
   diam = diameter of axes lines as fraction of shortest box length
subbox values = yes/no diam = draw outline of processor sub-domains
   yes/no = do or do not draw sub-domain lines
   diam = diameter of sub-domain lines as fraction of shortest box length
shiny value = sfactor = shinyness of spheres and cylinders
   sfactor = shinyness of spheres and cylinders from 0.0 to 1.0
ssao value = yes/no seed dfactor = SSAO depth shading
   yes/no = turn depth shading on/off
   seed = random # seed (positive integer)
   dfactor = strength of shading from 0.0 to 1.0

17.41.3 Description

Dump a high-quality rendered image of the atom configuration every N timesteps and save the images either as a sequence of JPEG or PNG or PPM files, or as a single movie file. The options for this command as well as the dump_modify command control what is included in the image or movie and how it appears. A series of such images can easily be manually converted into an animated movie of your simulation or the process can be automated without writing the intermediate files using the dump movie style; see further details below. Other dump styles store snapshots of numerical data associated with atoms in various formats, as discussed on the dump doc page.

Note that a set of images or a movie can be made after a simulation has been run, using the rerun command to read snapshots from an existing dump file, and using these dump commands in the rerun script to generate the images/movie.

Here are two sample images, rendered as 1024x1024 JPEG files.

Only atoms in the specified group are rendered in the image. The dump_modify region and thresh commands can also alter what atoms are included in the image. The filename suffix determines whether a JPEG, PNG, or PPM file is created with the image dump style. If the suffix is “.jpg” or “.jpeg”, then a JPEG format file is created, if the suffix is “.png”, then a PNG format is created, else a PPM (aka NETPBM) format file is created. The JPEG and PNG files are binary; PPM has a text mode header followed by binary data. JPEG images have lossy compression, PNG has lossless compression, and PPM files are uncompressed but can be compressed with gzip, if LAMMPS has been compiled with -DLAMMPS_GZIP and a “.gz” suffix is used.

Similarly, the format of the resulting movie is chosen with the movie dump style. This is handled by the underlying FFmpeg converter and thus details have to be looked up in the FFmpeg documentation. Typical examples are: .avi,
.mpg, .m4v, .mp4, .mkv, .flv, .mov, .gif Additional settings of the movie compression like bitrate and framerate can be set using the `dump_modify` command.

To write out JPEG and PNG format files, you must build LAMMPS with support for the corresponding JPEG or PNG library. To convert images into movies, LAMMPS has to be compiled with the `-DLAMMPS_FFMPEG` flag. See the `Build settings` doc page for details.

**Note:** Because periodic boundary conditions are enforced only on timesteps when neighbor lists are rebuilt, the coordinates of an atom in the image may be slightly outside the simulation box.

Dumps are performed on timesteps that are a multiple of N (including timestep 0) and on the last timestep of a minimization if the minimization converges. Note that this means a dump will not be performed on the initial timestep after the dump command is invoked, if the current timestep is not a multiple of N. This behavior can be changed via the `dump_modify first` command, which can be useful if the dump command is invoked after a minimization ended on an arbitrary timestep. N can be changed between runs by using the `dump_modify every` command.

Dump image filenames must contain a wildcard character “*”, so that one image file per snapshot is written. The “*” character is replaced with the timestep value. For example, `tmp.dump.*.jpg` becomes `tmp.dump.0.jpg`, `tmp.dump.10000.jpg`, `tmp.dump.20000.jpg`, etc. Note that the `dump_modify pad` command can be used to insure all timestep numbers are the same length (e.g. 00010), which can make it easier to convert a series of images into a movie in the correct ordering.

Dump movie filenames on the other hand, must not have any wildcard character since only one file combining all images into a single movie will be written by the movie encoder.

The `color` and `diameter` settings determine the color and size of atoms rendered in the image. They can be any atom attribute defined for the `dump custom` command, including `type` and `element`. This includes per-atom quantities calculated by a `compute`, `fix`, or `variable`, which are prefixed by “c_”, “f_”, or “v_” respectively. Note that the `diameter` setting can be overridden with a numeric value applied to all atoms by the optional `adiam` keyword.

If `type` is specified for the `color` setting, then the color of each atom is determined by its atom type. By default the mapping of types to colors is as follows:

- type 1 = red
- type 2 = green
- type 3 = blue
- type 4 = yellow
- type 5 = aqua
- type 6 = cyan

and repeats itself for types > 6. This mapping can be changed by the `dump_modify acolor` command.

If `type` is specified for the `diameter` setting then the diameter of each atom is determined by its atom type. By default all types have diameter 1.0. This mapping can be changed by the `dump_modify adiam` command.

If `element` is specified for the `color` and/or `diameter` setting, then the color and/or diameter of each atom is determined by which element it is, which in turn is specified by the element-to-type mapping specified by the “dump_modify element” command. By default every atom type is C (carbon). Every element has a color and diameter associated with it, which is the same as the colors and sizes used by the AtomEye visualization package.

If other atom attributes are used for the `color` or `diameter` settings, they are interpreted in the following way.
If “vx”, for example, is used as the color setting, then the color of the atom will depend on the x-component of its velocity. The association of a per-atom value with a specific color is determined by a “color map”, which can be specified via the `dump_modify` command. The basic idea is that the atom-attribute will be within a range of values, and every value within the range is mapped to a specific color. Depending on how the color map is defined, that mapping can take place via interpolation so that a value of -3.2 is halfway between “red” and “blue”, or discretely so that the value of -3.2 is “orange”.

If “vx”, for example, is used as the diameter setting, then the atom will be rendered using the x-component of its velocity as the diameter. If the per-atom value <= 0.0, then the atom will not be drawn. Note that finite-size spherical particles, as defined by `atom_style sphere` define a per-particle radius or diameter, which can be used as the diameter setting.

The various keywords listed above control how the image is rendered. As listed below, all of the keywords have defaults, most of which you will likely not need to change. The `dump modify` also has options specific to the dump image style, particularly for assigning colors to atoms, bonds, and other image features.

The `atom` keyword allow you to turn off the drawing of all atoms, if the specified value is no. Note that this will not turn off the drawing of particles that are represented as lines, triangles, or bodies, as discussed below. These particles can be drawn separately if the `line`, `tri`, or `body` keywords are used.

The `adiam` keyword allows you to override the diameter setting to set a single numeric size. All atoms will be drawn with that diameter, e.g. 1.5, which is in whatever distance units the input script defines, e.g. Angstroms.

The `bond` keyword allows to you to alter how bonds are drawn. A bond is only drawn if both atoms in the bond are being drawn due to being in the specified group and due to other selection criteria (e.g. region, threshold settings of the `dump_modify` command). By default, bonds are drawn if they are defined in the input data file as read by the `read_data` command. Using `none` for both the bond color and width value will turn off the drawing of all bonds.

If atom is specified for the bond color value, then each bond is drawn in 2 halves, with the color of each half being the color of the atom at that end of the bond.

If type is specified for the color value, then the color of each bond is determined by its bond type. By default the mapping of bond types to colors is as follows:

- type 1 = red
- type 2 = green
- type 3 = blue
- type 4 = yellow
- type 5 = aqua
- type 6 = cyan

and repeats itself for bond types > 6. This mapping can be changed by the `dump_modify bcolor` command.

The bond width value can be a numeric value or atom or type (or none as indicated above).

If a numeric value is specified, then all bonds will be drawn as cylinders with that diameter, e.g. 1.0, which is in whatever distance units the input script defines, e.g. Angstroms.

If atom is specified for the width value, then each bond will be drawn with a width corresponding to the minimum diameter of the 2 atoms in the bond.

If type is specified for the width value then the diameter of each bond is determined by its bond type. By default all types have diameter 0.5. This mapping can be changed by the `dump_modify bdiam` command.
The line keyword can be used when atom_style line is used to define particles as line segments, and will draw them as lines. If this keyword is not used, such particles will be drawn as spheres, the same as if they were regular atoms. The only setting currently allowed for the color value is type, which will color the lines according to the atom type of the particle. By default the mapping of types to colors is as follows:

- type 1 = red
- type 2 = green
- type 3 = blue
- type 4 = yellow
- type 5 = aqua
- type 6 = cyan

and repeats itself for types > 6. There is not yet an option to change this via the dump_modify command.

The line width can only be a numeric value, which specifies that all lines will be drawn as cylinders with that diameter, e.g. 1.0, which is in whatever distance units the input script defines, e.g. Angstroms.

The tri keyword can be used when atom_style tri is used to define particles as triangles, and will draw them as triangles or edges (3 lines) or both, depending on the setting for tflag. If edges are drawn, the width setting determines the diameters of the line segments. If this keyword is not used, triangle particles will be drawn as spheres, the same as if they were regular atoms. The only setting currently allowed for the color value is type, which will color the triangles according to the atom type of the particle. By default the mapping of types to colors is as follows:

- type 1 = red
- type 2 = green
- type 3 = blue
- type 4 = yellow
- type 5 = aqua
- type 6 = cyan

and repeats itself for types > 6. There is not yet an option to change this via the dump_modify command.

The body keyword can be used when atom_style body is used to define body particles with internal state (e.g. sub-particles), and will draw them in a manner specific to the body style. If this keyword is not used, such particles will be drawn as spheres, the same as if they were regular atoms.

The Howto body doc page describes the body styles LAMMPS currently supports, and provides more details as to the kind of body particles they represent and how they are drawn by this dump image command. For all the body styles, individual atoms can be either a body particle or a usual point (non-body) particle. Non-body particles will be drawn the same way they would be as a regular atom. The bflag1 and bflag2 settings are numerical values which are passed to the body style to affect how the drawing of a body particle is done. See the Howto body doc page for a description of what these parameters mean for each body style.

The only setting currently allowed for the color value is type, which will color the body particles according to the atom type of the particle. By default the mapping of types to colors is as follows:

- type 1 = red
- type 2 = green
• type 3 = blue  
• type 4 = yellow  
• type 5 = aqua   
• type 6 = cyan

and repeats itself for types > 6. There is not yet an option to change this via the `dump_modify` command.

The `fix` keyword can be used with a `fix` that produces objects to be drawn.  

The `fflag1` and `fflag2` settings are numerical values which are passed to the fix to affect how the drawing of its objects is done. See the individual fix doc page for a description of what these parameters mean for a particular fix.

The only setting currently allowed for the `color` value is `type`, which will color the fix objects according to their type. By default the mapping of types to colors is as follows:

• type 1 = red
• type 2 = green
• type 3 = blue
• type 4 = yellow
• type 5 = aqua
• type 6 = cyan

and repeats itself for types > 6. There is not yet an option to change this via the `dump_modify` command.

The `size` keyword sets the width and height of the created images, i.e. the number of pixels in each direction.

The `view`, `center`, `up`, `zoom`, and `persp` values determine how 3d simulation space is mapped to the 2d plane of the image. Basically they control how the simulation box appears in the image.

All of the `view`, `center`, `up`, `zoom`, and `persp` values can be specified as numeric quantities, whose meaning is explained below. Any of them can also be specified as an `equal-style variable`, by using `v_name` as the value, where “name” is the variable name. In this case the variable will be evaluated on the timestep each image is created to create a new value. If the equal-style variable is time-dependent, this is a means of changing the way the simulation box appears from image to image, effectively doing a pan or fly-by view of your simulation.

The `view` keyword determines the viewpoint from which the simulation box is viewed, looking towards the `center` point. The `theta` value is the vertical angle from the +z axis, and must be an angle from 0 to 180 degrees. The `phi` value is an azimuthal angle around the z axis and can be positive or negative. A value of 0.0 is a view along the +x axis, towards the `center` point. If `theta` or `phi` are specified via variables, then the variable values should be in degrees.

The `center` keyword determines the point in simulation space that will be at the center of the image. `Cx`, `Cy`, and `Cz` are specified as fractions of the box dimensions, so that (0.5,0.5,0.5) is the center of the simulation box. These values do not have to be between 0.0 and 1.0, if you want the simulation box to be offset from the center of the image. Note, however, that if you choose strange values for `Cx`, `Cy`, or `Cz` you may get a blank image. Internally, `Cx`, `Cy`, and `Cz` are converted into a point in simulation space. If `flag` is set to “s” for static, then this conversion is done once, at the time the dump command is issued. If `flag` is set to “d” for dynamic then the conversion is performed every time a new image is created. If the box size or shape is changing, this will adjust the center point in simulation space.

The `up` keyword determines what direction in simulation space will be “up” in the image. Internally it is stored as a vector that is in the plane perpendicular to the view vector implied by the `theta` and `phi` values, and which is also in the plane defined by the view vector and user-specified up vector. Thus this internal vector is computed from the user-specified `up` vector as

17.41. `dump movie command`
up internal = view cross (up cross view)

This means the only restriction on the specified up vector is that it cannot be parallel to the view vector, implied by the theta and phi values.

The zoom keyword scales the size of the simulation box as it appears in the image. The default zfactor value of 1 should display an image mostly filled by the atoms in the simulation box. A zfactor > 1 will make the simulation box larger; a zfactor < 1 will make it smaller. Zfactor must be a value > 0.0.

The persp keyword determines how much depth perspective is present in the image. Depth perspective makes lines that are parallel in simulation space appear non-parallel in the image. A pfactor value of 0.0 means that parallel lines will meet at infinity (1.0/pfactor), which is an orthographic rendering with no perspective. A pfactor value between 0.0 and 1.0 will introduce more perspective. A pfactor value > 1 will create a highly skewed image with a large amount of perspective.

Note: The persp keyword is not yet supported as an option.

The box keyword determines if and how the simulation box boundaries are rendered as thin cylinders in the image. If no is set, then the box boundaries are not drawn and the diam setting is ignored. If yes is set, the 12 edges of the box are drawn, with a diameter that is a fraction of the shortest box length in x,y,z (for 3d) or x,y (for 2d). The color of the box boundaries can be set with the dump_modify boxcolor command.

The axes keyword determines if and how the coordinate axes are rendered as thin cylinders in the image. If no is set, then the axes are not drawn and the length and diam settings are ignored. If yes is set, 3 thin cylinders are drawn to represent the x,y,z axes in colors red,green,blue. The origin of these cylinders will be offset from the lower left corner of the box by 10%. The length setting determines how long the cylinders will be as a fraction of the respective box lengths. The diam setting determines their thickness as a fraction of the shortest box length in x,y,z (for 3d) or x,y (for 2d).

The subbox keyword determines if and how processor sub-domain boundaries are rendered as thin cylinders in the image. If no is set (default), then the sub-domain boundaries are not drawn and the diam setting is ignored. If yes is set, the 12 edges of each processor sub-domain are drawn, with a diameter that is a fraction of the shortest box length in x,y,z (for 3d) or x,y (for 2d). The color of the sub-domain boundaries can be set with the dump_modify boxcolor command.

The shiny keyword determines how shiny the objects rendered in the image will appear. The sfactor value must be a value 0.0 <= sfactor <= 1.0, where sfactor = 1 is a highly reflective surface and sfactor = 0 is a rough non-shiny surface.

The ssao keyword turns on/off a screen space ambient occlusion (SSAO) model for depth shading. If yes is set, then atoms further away from the viewer are darkened via a randomized process, which is perceived as depth. The calculation of this effect can increase the cost of computing the image by roughly 2x. The strength of the effect can be scaled by the dfactor parameter. If no is set, no depth shading is performed.

A series of JPEG, PNG, or PPM images can be converted into a movie file and then played as a movie using commonly available tools. Using dump style movie automates this step and avoids the intermediate step of writing (many) image snapshot file. But LAMMPS has to be compiled with -DLAMMPS_FFMPEG and an FFmpeg executable have to be installed.

To manually convert JPEG, PNG or PPM files into an animated GIF or MPEG or other movie file you can use:

- a) Use the ImageMagick convert program.
Animated GIF files from ImageMagick are not optimized. You can use a program like gifsicle to optimize and thus massively shrink them. MPEG files created by ImageMagick are in MPEG-1 format with a rather inefficient compression and low quality compared to more modern compression styles like MPEG-4, H.264, VP8, VP9, H.265 and so on.

- b) Use QuickTime.
  Select “Open Image Sequence” under the File menu Load the images into QuickTime to animate them Select “Export” under the File menu Save the movie as a QuickTime movie (*.mov) or in another format. QuickTime can generate very high quality and efficiently compressed movie files. Some of the supported formats require to buy a license and some are not readable on all platforms until specific runtime libraries are installed.

- c) Use FFmpeg
  FFmpeg is a command line tool that is available on many platforms and allows extremely flexible encoding and decoding of movies.

```
% mplayer foo.mpg
% ffplay bar.avi
```

Front ends for FFmpeg exist for multiple platforms. For more information see the FFmpeg homepage

---

Play the movie:

- a) Use your browser to view an animated GIF movie.
  Select “Open File” under the File menu Load the animated GIF file
- b) Use the freely available mplayer or ffplay tool to view a movie. Both are available for multiple OSes and support a large variety of file formats and decoders.

```
% mplayer foo.mpg
% ffplay bar.avi
```

- c) Use the Pizza.py animate tool, which works directly on a series of image files.

```
a = animate("foo*.jpg")
```

- d) QuickTime and other Windows- or MacOS-based media players can obviously play movie files directly. Similarly for corresponding tools bundled with Linux desktop environments. However, due to licensing issues with some file formats, the formats may require installing additional libraries, purchasing a license, or may not be supported.

See the Modify doc page for information on how to add new compute and fix styles to LAMMPS to calculate per-atom quantities which could then be output into dump files.
17.41.4 Restrictions

To write JPEG images, you must use the -DLAMMPS_JPEG switch when building LAMMPS and link with a JPEG library. To write PNG images, you must use the -DLAMMPS_PNG switch when building LAMMPS and link with a PNG library.

To write *movie* dumps, you must use the -DLAMMPS_FFMPEG switch when building LAMMPS and have the FFmpeg executable available on the machine where LAMMPS is being run. Typically it’s name is lowercase, i.e. ffmpeg.

See the *Build settings* doc page for details.

Note that since FFmpeg is run as an external program via a pipe, LAMMPS has limited control over its execution and no knowledge about errors and warnings printed by it. Those warnings and error messages will be printed to the screen only. Due to the way image data is communicated to FFmpeg, it will often print the message

```
pipe:: Input/output error
```

which can be safely ignored. Other warnings and errors have to be addressed according to the FFmpeg documentation. One known issue is that certain movie file formats (e.g. MPEG level 1 and 2 format streams) have video bandwidth limits that can be crossed when rendering too large of image sizes. Typical warnings look like this:

```
mpeg @ 0x98b5e0] packet too large, ignoring buffer limits to mux it
mpeg @ 0x98b5e0] buffer underflow st=0 bufi=281407 size=285018
mpeg @ 0x98b5e0] buffer underflow st=0 bufi=283448 size=285018
```

In this case it is recommended to either reduce the size of the image or encode in a different format that is also supported by your copy of FFmpeg, and which does not have this limitation (e.g. .avi, .mkv, mp4).

17.41.5 Related commands

*dump, dump_modify, undump*

17.41.6 Default

The defaults for the keywords are as follows:

- `adiam =` not specified (use diameter setting)
- `atom =` yes
- `bond = none none` (if no bonds in system)
- `bond = atom 0.5` (if bonds in system)
- `size = 512 512`
- `view = 60 30` (for 3d)
- `view = 0 0` (for 2d)
- `center = s 0.5 0.5 0.5`
- `up = 0 0 1` (for 3d)
- `up = 0 1 0` (for 2d)
- `zoom = 1.0`
- `persp = 0.0`
- `box = yes 0.02`
• axes = no 0.0 0.0
• subbox no 0.0
• shiny = 1.0
• ssao = no

17.42 dump_modify command

17.42.1 Syntax

dump_modify dump-ID keyword values ...

dump-ID = ID of dump to modify
one or more keyword/value pairs may be appended
these keywords apply to various dump styles
keyword = append or at or buffer or delay or element or every or fileper or first or flush or format or image or
label or maxfiles or nfile or pad or pbc or precision or region or refresh or scale or sfactor or sort or tfactor or
thermo or thresh or time or units or unwrap

append arg = yes or no
at arg = N
  N = index of frame written upon first dump
buffer arg = yes or no
delay arg = Dstep
  Dstep = delay output until this timestep
element args = E1 E2 ... EN, where N = # of atom types
e1,...,EN = element name, e.g. C or Fe or Ga
every arg = N
  N = dump every this many timesteps
  N can be a variable (see below)
fileper arg = Np
  Np = write one file for every this many processors
first arg = yes or no
flush arg = yes or no
format args = line string, int string, float string, M string, or none
  string = C-style format string
  M = integer from 1 to N, where N = # of per-atom quantities being output
image arg = yes or no
label arg = string
  string = character string (e.g. BONDS) to use in header of dump local .
  file
maxfiles arg = Fmax
  Fmax = keep only the most recent Fmax snapshots (one snapshot per file)
nfile arg = Nf
  Nf = write this many files, one from each of Nf processors
pad arg = Nchar = # of characters to convert timestep to
pbc arg = yes or no = remap atoms via periodic boundary conditions
precision arg = power-of-10 value from 10 to 1000000
region arg = region-ID or "none"
refresh arg = c_ID = compute ID that supports a refresh operation
scale arg = yes or no
sfactor arg = coordinate scaling factor (> 0.0)
sort arg = off or id or N or -N
  off = no sorting of per-atom lines within a snapshot
  id = sort per-atom lines by atom ID
  N = sort per-atom lines in ascending order by the Nth column
  -N = sort per-atom lines in descending order by the Nth column
tfactor arg = time scaling factor (> 0.0)
thermo arg = yes or no
time arg = yes or no
thresh args = attribute operator value
  attribute = same attributes (x, fy, etotal, sxx, etc) used by dump custom,
  operator = "<" or "<=" or ">" or ">=" or ">=" or ">=" or ">=" or ">=
  value = numeric value to compare to, or LAST
  these 3 args can be replaced by the word "none" to turn off thresholding
units arg = yes or no
unwrap arg = yes or no

• these keywords apply only to the image and movie styles

• keyword = acolor or adiam or amap or backcolor or bcolor or bdiam or boxcolor or color or bitrate or framerate

acolor args = type color
  type = atom type or range of types (see below)
  color = name of color or color1/color2/...

adiam args = type diam
  type = atom type or range of types (see below)
  diam = diameter of atoms of that type (distance units)

amap args = lo hi style delta N entry1 entry2 ... entryN
  lo = number or min = lower bound of range of color map
  hi = number or max = upper bound of range of color map
  style = 2 letters = "c" or "d" or "s" plus "a" or "f"
  "c" for continuous
  "d" for discrete
  "s" for sequential
  "a" for absolute
  "f" for fractional
  delta = binsize (only used for style "s", otherwise ignored)
  binsize = range is divided into bins of this width
  N = # of subsequent entries
  entry = value color (for continuous style)
  value = number or min or max = single value within range
  color = name of color used for that value
  entry = lo hi color (for discrete style)
  lo/hi = number or min or max = lower/upper bound of subset of range
  color = name of color used for that subset of values
  entry = color (for sequential style)
  color = name of color used for a bin of values

backcolor arg = color
  color = name of color for background

bcolor args = type color
  type = bond type or range of types (see below)
  color = name of color or color1/color2/...
type = bond type or range of types (see below)
diam = diameter of bonds of that type (distance units)
boxcolor arg = color
   color = name of color for simulation box lines and processor sub-domain lines
color args = name R G B
   name = name of color
   R,G,B = red/green/blue numeric values from 0.0 to 1.0
bitrate arg = rate
   rate = target bitrate for movie in kbps
framerate arg = fps
   fps = frames per second for movie

17.42.3 Description

Modify the parameters of a previously defined dump command. Not all parameters are relevant to all dump styles.

As explained on the dump doc page, the atom/mpiio, custom/mpiio, and xyz/mpiio dump styles are identical in command syntax and in the format of the dump files they create, to the corresponding styles without “mpiio”, except the single dump file they produce is written in parallel via the MPI-IO library. Thus if a dump_modify option below is valid for the atom style, it is also valid for the atom/mpiio style, and similarly for the other styles which allow for use of MPI-IO.

These keywords apply to various dump styles, including the dump image and dump movie styles. The description gives details.

The append keyword applies to all dump styles except cfg and xtc and dcd. It also applies only to text output files, not to binary or gzipped or image/movie files. If specified as yes, then dump snapshots are appended to the end of an
existing dump file. If specified as no, then a new dump file will be created which will overwrite an existing file with the same name.

The at keyword only applies to the netcdf dump style. It can only be used if the append yes keyword is also used. The N argument is the index of which frame to append to. A negative value can be specified for N, which means a frame counted from the end of the file. The at keyword can only be used if the dump_modify command is before the first command that causes dump snapshots to be output, e.g. a run or minimize command. Once the dump file has been opened, this keyword has no further effect.

The buffer keyword applies only to dump styles atom, cfg, custom, local, and xyz. It also applies only to text output files, not to binary or gzipped files. If specified as yes, which is the default, then each processor writes its output into an internal text buffer, which is then sent to the processor(s) which perform file writes, and written by those processors(s) as one large chunk of text. If specified as no, each processor sends its per-atom data in binary format to the processor(s) which perform file writes, and those processor(s) format and write it line by line into the output file.

The buffering mode is typically faster since each processor does the relatively expensive task of formatting the output for its own atoms. However it requires about twice the memory (per processor) for the extra buffering.

The delay keyword applies to all dump styles. No snapshots will be output until the specified Dstep timestep or later. Specifying Dstep < 0 is the same as turning off the delay setting. This is a way to turn off unwanted output early in a simulation, for example, during an equilibration phase.

The element keyword applies only to the dump cfg, xyz, and image styles. It associates element names (e.g. H, C, Fe) with LAMMPS atom types. See the list of element names at the bottom of this page.

In the case of dump cfg, this allows the AtomEye visualization package to read the dump file and render atoms with the appropriate size and color.

In the case of dump image, the output images will follow the same AtomEye convention. An element name is specified for each atom type (1 to Ntype) in the simulation. The same element name can be given to multiple atom types.

In the case of xyz format dumps, there are no restrictions to what label can be used as an element name. Any whitespace separated text will be accepted.

The every keyword changes the dump frequency originally specified by the dump command to a new value. The every keyword can be specified in one of two ways. It can be a numeric value in which case it must be > 0. Or it can be an equal-style variable, which should be specified as v_name, where name is the variable name.

In this case, the variable is evaluated at the beginning of a run to determine the next timestep at which a dump snapshot will be written out. On that timestep the variable will be evaluated again to determine the next timestep, etc. Thus the variable should return timestep values. See the stagger() and logfreq() and stride() math functions for equal-style variables, as examples of useful functions to use in this context. Other similar math functions could easily be added as options for equal-style variables. Also see the next() function, which allows use of a file-style variable which reads successive values from a file, each time the variable is evaluated. Used with the every keyword, if the file contains a list of ascending timesteps, you can output snapshots whenever you wish.

Note that when using the variable option with the every keyword, you need to use the first option if you want an initial snapshot written to the dump file. The every keyword cannot be used with the dump dcd style.

For example, the following commands will write snapshots at timesteps 0,10,20,30,100,200,300,1000,2000,etc:
variable s equal logfreq(10,3,10)
dump 1 all atom 100 tmp.dump
dump_modify 1 every v_s first yes

The following commands would write snapshots at the timesteps listed in file tmp.times:

variable f file tmp.times
variable s equal next(f)
dump 1 all atom 100 tmp.dump
dump_modify 1 every v_s

Note: When using a file-style variable with the every keyword, the file of timesteps must list a first timestep that is beyond the current timestep (e.g. it cannot be 0). And it must list one or more timesteps beyond the length of the run you perform. This is because the dump command will generate an error if the next timestep it reads from the file is not a value greater than the current timestep. Thus if you wanted output on steps 0,15,100 of a 100-timestep run, the file should contain the values 15,100,101 and you should also use the dump_modify first command. Any final value > 100 could be used in place of 101.

The first keyword determines whether a dump snapshot is written on the very first timestep after the dump command is invoked. This will always occur if the current timestep is a multiple of N, the frequency specified in the dump command, including timestep 0. But if this is not the case, a dump snapshot will only be written if the setting of this keyword is yes. If it is no, which is the default, then it will not be written.

The flush keyword determines whether a flush operation is invoked after a dump snapshot is written to the dump file. A flush insures the output in that file is current (no buffering by the OS), even if LAMMPS halts before the simulation completes. Flushes cannot be performed with dump style xtc.

The format keyword can be used to change the default numeric format output by the text-based dump styles: atom, custom, cfg, and xyz styles, and their MPIIO variants. Only the line or none options can be used with the atom and xyz styles.

All the specified format strings are C-style formats, e.g. as used by the C/C++ printf() command. The line keyword takes a single argument which is the format string for an entire line of output for each atom (do not include a trailing “n”), with N fields, which you must enclose in quotes if it is more than one field. The int and float keywords take a single format argument and are applied to all integer or floating-point quantities output. The setting for M string also takes a single format argument which is used for the Mth value output in each line, e.g. the fifth column is output in high precision for “format 5 %20.15g”.

Note: When using the line keyword for the cfg style, the first two fields (atom ID and type) are not actually written into the CFG file, however you must include formats for them in the format string.

The format keyword can be used multiple times. The precedence is that for each value in a line of output, the M format (if specified) is used, else the int or float setting (if specified) is used, else the line setting (if specified) for that value is used, else the default setting is used. A setting of none clears all previous settings, reverting all values to their default format.

Note: Atom and molecule IDs are stored internally as 4-byte or 8-byte signed integers, depending on how LAMMPS was compiled. When specifying the format int option you can use a “%d”:style format identifier in the format string.
and LAMMPS will convert this to the corresponding 8-byte form if it is needed when outputting those values. However, when specifying the line option or format M string option for those values, you should specify a format string appropriate for an 8-byte signed integer, e.g. one with “%ld”, if LAMMPS was compiled with the -DLAMMPS_BIGBIG option for 8-byte IDs.

**Note:** Any value written to a text-based dump file that is a per-atom quantity calculated by a compute or fix is stored internally as a floating-point value. If the value is actually an integer and you wish it to appear in the text dump file as a (large) integer, then you need to use an appropriate format. For example, these commands:

```plaintext
compute 1 all property/local batom1 batom2
dump 1 all local 100 tmp.bonds index c_l[1] c_l[2]
dump_modify 1 format "%d %0.0f %0.0f"
```

will output the two atom IDs for atoms in each bond as integers. If the dump_modify command were omitted, they would appear as floating-point values, assuming they were large integers (more than 6 digits). The “index” keyword should use the “%d” format since it is not generated by a compute or fix, and is stored internally as an integer.

The **fileper** keyword is documented below with the **nfile** keyword.

The **image** keyword applies only to the dump **atom** style. If the image value is **yes**, 3 flags are appended to each atom’s coords which are the absolute box image of the atom in each dimension. For example, an x image flag of -2 with a normalized coord of 0.5 means the atom is in the center of the box, but has passed through the box boundary 2 times and is really 2 box lengths to the left of its current coordinate. Note that for dump style **custom** these various values can be printed in the dump file by using the appropriate atom attributes in the dump command itself.

The **label** keyword applies only to the dump **local** style. When it writes local information, such as bond or angle topology to a dump file, it will use the specified **label** to format the header. By default this includes 2 lines:

```
ITEM: NUMBER OF ENTRIES
ITEM: ENTRIES ...
```

The word “ENTRIES” will be replaced with the string specified, e.g. BONDS or ANGLES.

The **maxfiles** keyword can only be used when a ‘*’ wildcard is included in the dump file name, i.e. when writing a new file(s) for each snapshot. The specified **Fmax** is how many snapshots will be kept. Once this number is reached, the file(s) containing the oldest snapshot is deleted before a new dump file is written. If the specified **Fmax** <= 0, then all files are retained.

This can be useful for debugging, especially if you don’t know on what timestep something bad will happen, e.g. when LAMMPS will exit with an error. You can dump every timestep, and limit the number of dump files produced, even if you run for 1000s of steps.

The **nfile** or **fileper** keywords can be used in conjunction with the “%” wildcard character in the specified dump file name, for all dump styles except the dcd, image, movie, etc, and xyz styles (for which “%” is not allowed). As explained on the **dump** command doc page, the “%” character causes the dump file to be written in pieces, one piece for each of P processors. By default P = the number of processors the simulation is running on. The **nfile** or **fileper** keyword can be used to set P to a smaller value, which can be more efficient when running on a large number of processors.
The `nfile` keyword sets \( P \) to the specified \( N_f \) value. For example, if \( N_f = 4 \), and the simulation is running on 100 processors, 4 files will be written, by processors 0,25,50,75. Each will collect information from itself and the next 24 processors and write it to a dump file.

For the `fileper` keyword, the specified value of \( N_p \) means write one file for every \( N_p \) processors. For example, if \( N_p = 4 \), every fourth processor (0,4,8,12,etc) will collect information from itself and the next 3 processors and write it to a dump file.

The `pad` keyword only applies when the dump filename is specified with a wildcard “*” character which becomes the timestep. If `pad` is 0, which is the default, the timestep is converted into a string of unpadded length, e.g. 100 or 12000 or 2000000. When `pad` is specified with \( N_{char} > 0 \), the string is padded with leading zeroes so they are all the same length = \( N_{char} \). For example, pad 7 would yield 0000100, 0012000, 2000000. This can be useful so that post-processing programs can easily read the files in ascending timestep order.

The `pbc` keyword applies to all the dump styles. As explained on the `dump` doc page, atom coordinates in a dump file may be slightly outside the simulation box. This is because periodic boundary conditions are enforced only on timesteps when neighbor lists are rebuilt, which will not typically coincide with the timesteps dump snapshots are written. If the setting of this keyword is set to `yes`, then all atoms will be remapped to the periodic box before the snapshot is written, then restored to their original position. If it is set to `no` they will not be. The `no` setting is the default because it requires no extra computation.

The `precision` keyword only applies to the dump `xtc` style. A specified value of \( N \) means that coordinates are stored to \( 1/N \) nanometer accuracy, e.g. for \( N = 1000 \), the coordinates are written to \( 1/1000 \) nanometer accuracy.

The `refresh` keyword only applies to the dump `custom`, `cfg`, `image`, and `movie` styles. It allows an “incremental” dump file to be written, by refreshing a compute that is used as a threshold for determining which atoms are included in a dump snapshot. The specified `c_ID` gives the ID of the compute. It is prefixed by “c_” to indicate a compute, which is the only current option. At some point, other options may be added, e.g. fixes or variables.

**Note:** This keyword can only be specified once for a dump. Refreshes of multiple computes cannot yet be performed.

The definition and motivation of an incremental dump file is as follows. Instead of outputting all atoms at each snapshot (with some associated values), you may only wish to output the subset of atoms with a value that has changed in some way compared to the value the last time that atom was output. In some scenarios this can result in a dramatically smaller dump file. If desired, by post-processing the sequence of snapshots, the values for all atoms at all timesteps can be inferred.

A concrete example is a simulation of atom diffusion in a solid, represented as atoms on a lattice. Diffusive hops are rare. Imagine that when a hop occurs an atom moves more than a distance \( D_{hop} \). For any snapshot we only want to output atoms that have hopped since the last snapshot. This can be accomplished with something the following commands:

```
variable Dhop equal 0.6
variable check atom "c_dsp[4] > v_Dhop"
compute dsp all displace/atom refresh check
dump 1 all custom 20 tmp.dump id type x y z
dump_modify 1 append yes thresh c_dsp[4] > ${Dhop} refresh c_dsp
```
The \textit{compute displace/atom} command calculates the displacement of each atom from its reference position. The “4” index is the scalar displacement; 1,2,3 are the xyz components of the displacement. The \textit{dump_modify thresh} command will cause only atoms that have displaced more than 0.6 Angstroms to be output on a given snapshot (assuming metal units). However, note that when an atom is output, we also need to update the reference position for that atom to its new coordinates. So that it will not be output in every snapshot thereafter. That reference position is stored by \textit{compute displace/atom}. So the \textit{dump_modify refresh} option triggers a call to \textit{compute displace/atom} at the end of every dump to perform that update. The \textit{refresh check} option shown as part of the \textit{compute displace/atom} command enables the compute to respond to the call from the dump command, and update the appropriate reference positions. This is done by defining an \textit{atom-style variable}, \textit{check} in this example, which calculates a Boolean value (0 or 1) for each atom, based on the same criterion used by \textit{dump_modify thresh}.

See the \textit{compute displace/atom} command for more details, including an example of how to produce output that includes an initial snapshot with the reference position of all atoms.

Note that only computes with a \textit{refresh} option will work with \textit{dump_modify refresh}. See individual compute doc pages for details. Currently, only compute displace/atom supports this option. Others may be added at some point. If you use a compute that does not support refresh operations, LAMMPS will not complain; \textit{dump_modify refresh} will simply do nothing.

The \textit{region} keyword only applies to the dump \textit{custom, cfg, image, and movie} styles. If specified, only atoms in the region will be written to the dump file or included in the image/movie. Only one region can be applied as a filter (the last one specified). See the \textit{region} command for more details. Note that a region can be defined as the “inside” or “outside” of a geometric shape, and it can be the “union” or “intersection” of a series of simpler regions.

The \textit{scale} keyword applies only to the dump \textit{atom} style. A scale value of \textit{yes} means atom coords are written in normalized units from 0.0 to 1.0 in each box dimension. If the simulation box is triclinic (tilted), then all atom coords will still be between 0.0 and 1.0. A value of \textit{no} means they are written in absolute distance units (e.g. Angstroms or sigma).

The \textit{sfactor} and \textit{tfactor} keywords only apply to the dump \textit{xtc} style. They allow customization of the unit conversion factors used when writing to XTC files. By default they are initialized for whatever \textit{units} style is being used, to write out coordinates in nanometers and time in picoseconds. I.e. for \textit{real} units, LAMMPS defines \textit{sfactor} = 0.1 and \textit{tfactor} = 0.001, since the Angstroms and fs used by \textit{real} units are 0.1 nm and 0.001 ps respectively. If you are using a units system with distance and time units far from nm and ps, you may wish to write XTC files with different units, since the compression algorithm used in XTC files is most effective when the typical magnitude of position data is between 10.0 and 0.1.

The \textit{sort} keyword determines whether lines of per-atom output in a snapshot are sorted or not. A sort value of \textit{off} means they will typically be written in indeterminate order, either in serial or parallel. This is the case even in serial if the \textit{atom_modify sort} option is turned on, which it is by default, to improve performance. A sort value of \textit{id} means sort the output by atom ID. A sort value of N or \textit{-N} means sort the output by the value in the Nth column of per-atom info in either ascending or descending order.

The dump \textit{local} style cannot be sorted by atom ID, since there are typically multiple lines of output per atom. Some dump styles, such as \textit{dcd} and \textit{xtc}, require sorting by atom ID to format the output file correctly. If multiple processors are writing the dump file, via the “%” wildcard in the dump filename, then sorting cannot be performed.

\textbf{Note:} Unless it is required by the dump style, sorting dump file output requires extra overhead in terms of CPU and communication cost, as well as memory, versus unsorted output.
The `thermo` keyword only applies the dump `netcdf` style. It triggers writing of `thermo` information to the dump file alongside per-atom data. The values included in the dump file are identical to the values specified by `thermo_style`.

The `thresh` keyword only applies to the dump `custom`, `cfg`, `image`, and `movie` styles. Multiple thresholds can be specified. Specifying `none` turns off all threshold criteria. If thresholds are specified, only atoms whose attributes meet all the threshold criteria are written to the dump file or included in the image. The possible attributes that can be tested for are the same as those that can be specified in the `dump custom` command, with the exception of the `element` attribute, since it is not a numeric value. Note that a different attribute can be used than those output by the `dump custom` command. E.g. you can output the coordinates and stress of atoms whose energy is above some threshold.

If an atom-style variable is used as the attribute, then it can produce continuous numeric values or effective Boolean 0/1 values which may be useful for the comparison operator. Boolean values can be generated by variable formulas that use comparison or Boolean math operators or special functions like gmask() and rmask() and grmask(). See the `variable` command doc page for details.

The specified value must be a simple numeric value or the word LAST. If LAST is used, it refers to the value of the attribute the last time the dump command was invoked to produce a snapshot. This is a way to only dump atoms whose attribute has changed (or not changed). Three examples follow.

```
dump_modify ... thresh ix != LAST
```

This will dump atoms which have crossed the periodic x boundary of the simulation box since the last dump. (Note that atoms that crossed once and then crossed back between the two dump timesteps would not be included.)

```
region foo sphere 10 20 10 15
variable inregion atom rmask(foo)
dump_modify ... thresh v_inregion |^ LAST
```

This will dump atoms which crossed the boundary of the spherical region since the last dump.

```
variable charge atom "((q > 0.5) || (q < -0.5))"
dump_modify ... thresh v_charge |^ LAST
```

This will dump atoms whose charge has changed from an absolute value less than 1/2 to greater than 1/2 (or vice versa) since the last dump. E.g. due to reactions and subsequent charge equilibration in a reactive force field.

The choice of operators listed above are the usual comparison operators. The XOR operation (exclusive or) is also included as "|^". In this context, XOR means that if either the attribute or value is 0.0 and the other is non-zero, then the result is “true” and the threshold criterion is met. Otherwise it is not met.

The `time` keyword only applies to the dump `atom`, `custom`, and `local` styles (and their COMPRESS package versions `atom/gz`, `custom/gz` and `local/gz`). If set to `yes`, each frame will will contain two extra lines before the “ITEM: TIMESTEP” entry:

```
ITEM: TIME
<elapsed time>
```

This will output the current elapsed simulation time in current time units equivalent to the `thermo keyword time`. This is to simplify post-processing of trajectories using a variable time step, e.g. when using `fix dt/reset`. The default setting is `no`.

The `units` keyword only applies to the dump `atom`, `custom`, and `local` styles (and their COMPRESS package versions `atom/gz`, `custom/gz` and `local/gz`). If set to `yes`, each individual dump file will contain two extra lines at the very beginning with:
ITEM: UNITS
<units style>

This will output the current selected units style to the dump file and thus allows visualization and post-processing tools to determine the choice of units of the data in the dump file. The default setting is no.

The unwrap keyword only applies to the dump dcd and xtc styles. If set to yes, coordinates will be written “unwrapped” by the image flags for each atom. Unwrapped means that if the atom has passed through a periodic boundary one or more times, the value is printed for what the coordinate would be if it had not been wrapped back into the periodic box. Note that these coordinates may thus be far outside the box size stored with the snapshot.

These keywords apply only to the dump image and dump movie styles. Any keyword that affects an image, also affects a movie, since the movie is simply a collection of images. Some of the keywords only affect the dump movie style. The descriptions give details.

The acolor keyword can be used with the dump image command, when its atom color setting is type, to set the color that atoms of each type will be drawn in the image.

The specified type should be an integer from 1 to Ntypes = the number of atom types. A wildcard asterisk can be used in place of or in conjunction with the type argument to specify a range of atom types. This takes the form “*” or “*n” or “n*” or “m*n”. If N = the number of atom types, then an asterisk with no numeric values means all types from 1 to N. A leading asterisk means all types from 1 to n (inclusive). A trailing asterisk means all types from n to N (inclusive). A middle asterisk means all types from m to n (inclusive).

The specified color can be a single color which is any of the 140 pre-defined colors (see below) or a color name defined by the dump_modify color option. Or it can be two or more colors separated by a “/” character, e.g. red/green/blue. In the former case, that color is assigned to all the specified atom types. In the latter case, the list of colors are assigned in a round-robin fashion to each of the specified atom types.

The adiam keyword can be used with the dump image command, when its atom diameter setting is type, to set the size that atoms of each type will be drawn in the image. The specified type should be an integer from 1 to Ntypes. As with the acolor keyword, a wildcard asterisk can be used as part of the type argument to specify a range of atom types. The specified diam is the size in whatever distance units the input script is using, e.g. Angstroms.

The amap keyword can be used with the dump image command, with its atom keyword, when its atom setting is an atom-attribute, to setup a color map. The color map is used to assign a specific RGB (red/green/blue) color value to an individual atom when it is drawn, based on the atom’s attribute, which is a numeric value, e.g. its x-component of velocity if the atom-attribute “vx” was specified.

The basic idea of a color map is that the atom-attribute will be within a range of values, and that range is associated with a series of colors (e.g. red, blue, green). An atom’s specific value (vx = -3.2) can then mapped to the series of colors (e.g. halfway between red and blue), and a specific color is determined via an interpolation procedure.

There are many possible options for the color map, enabled by the amap keyword. Here are the details.

The lo and hi settings determine the range of values allowed for the atom attribute. If numeric values are used for lo and/or hi, then values that are lower/higher than that value are set to the value. I.e. the range is static. If lo is specified as min or hi as max then the range is dynamic, and the lower and/or upper bound will be calculated each time an image is drawn, based on the set of atoms being visualized.

The style setting is two letters, such as “ca”. The first letter is either “c” for continuous, “d” for discrete, or “s” for sequential. The second letter is either “a” for absolute, or “f” for fractional.
A continuous color map is one in which the color changes continuously from value to value within the range. A discrete color map is one in which discrete colors are assigned to sub-ranges of values within the range. A sequential color map is one in which discrete colors are assigned to a sequence of sub-ranges of values covering the entire range.

An absolute color map is one in which the values to which colors are assigned are specified explicitly as values within the range. A fractional color map is one in which the values to which colors are assigned are specified as a fractional portion of the range. For example if the range is from -10.0 to 10.0, and the color red is to be assigned to atoms with a value of 5.0, then for an absolute color map the number 5.0 would be used. But for a fractional map, the number 0.75 would be used since 5.0 is 3/4 of the way from -10.0 to 10.0.

The \texttt{delta} setting must be specified for all styles, but is only used for the sequential style; otherwise the value is ignored. It specifies the bin size to use within the range for assigning consecutive colors to. For example, if the range is from -10.0 to 10.0 and a \texttt{delta} of 1.0 is used, then 20 colors will be assigned to the range. The first will be from \(-10.0 \leq \text{color1} < -9.0\), then second from \(-9.0 \leq \text{color2} < -8.0\), etc.

The \texttt{N} setting is how many entries follow. The format of the entries depends on whether the color map style is continuous, discrete or sequential. In all cases the \texttt{color} setting can be any of the 140 pre-defined colors (see below) or a color name defined by the \texttt{dump_modify color} option.

For continuous color maps, each entry has a \texttt{value} and a \texttt{color}. The \texttt{value} is either a number within the range of values or \texttt{min} or \texttt{max}. The \texttt{value} of the first entry must be \texttt{min} and the \texttt{value} of the last entry must be \texttt{max}. Any entries in between must have increasing values. Note that numeric values can be specified either as absolute numbers or as fractions (0.0 to 1.0) of the range, depending on the “a” or “f” in the style setting for the color map.

Here is how the entries are used to determine the color of an individual atom, given the value \(X\) of its atom attribute. \(X\) will fall between 2 of the entry values. The color of the atom is linearly interpolated (in each of the RGB values) between the 2 colors associated with those entries. For example, if \(X = -5.0\) and the 2 surrounding entries are “red” at \(-10.0\) and “blue” at 0.0, then the atom’s color will be halfway between “red” and “blue”, which happens to be “purple”.

For discrete color maps, each entry has a \texttt{lo} and \texttt{hi} value and a \texttt{color}. The \texttt{lo} and \texttt{hi} settings are either numbers within the range of values or \texttt{lo} can be \texttt{min} or \texttt{hi} can be \texttt{max}. The \texttt{lo} and \texttt{hi} settings of the last entry must be \texttt{min} and \texttt{max}. Other entries can have any \texttt{lo} and \texttt{hi} values and the sub-ranges of different values can overlap. Note that numeric \texttt{lo} and \texttt{hi} values can be specified either as absolute numbers or as fractions (0.0 to 1.0) of the range, depending on the “a” or “f” in the style setting for the color map.

Here is how the entries are used to determine the color of an individual atom, given the value \(X\) of its atom attribute. The entries are scanned from first to last. The first time that \texttt{lo} \(\leq X \leq \text{hi}\), \(X\) is assigned the color associated with that entry. You can think of the last entry as assigning a default color (since it will always be matched by \(X\)), and the earlier entries as colors that override the default. Also note that no interpolation of a color RGB is done. All atoms will be drawn with one of the colors in the list of entries.

For sequential color maps, each entry has only a \texttt{color}. Here is how the entries are used to determine the color of an individual atom, given the value \(X\) of its atom attribute. The range is partitioned into \(N\) bins of width \texttt{binsize}. Thus \(X\) will fall in a specific bin from 1 to \(N\), say the \(M\)th bin. If it falls on a boundary between 2 bins, it is considered to be in the higher of the 2 bins. Each bin is assigned a color from the \(E\) entries. If \(E < N\), then the colors are repeated. For example if 2 entries with colors red and green are specified, then the odd numbered bins will be red and the even bins green. The color of the atom is the color of its bin. Note that the sequential color map is really a shorthand way of defining a discrete color map without having to specify where all the bin boundaries are.

Here is an example of using a sequential color map to color all the atoms in individual molecules with a different color. See the examples/pour/in.pour.2d.molecule input script for an example of how this is used.

In this case, 10 colors are defined, and molecule IDs are mapped to one of the colors, even if there are 1000s of molecules.

The `backcolor` sets the background color of the images. The color name can be any of the 140 pre-defined colors (see below) or a color name defined by the `dump_modify color` option.

The `bcolor` keyword can be used with the `dump image` command, with its `bond` keyword, when its color setting is `type`, to set the color that bonds of each type will be drawn in the image.

The specified `type` should be an integer from 1 to `Nbondtypes =` the number of bond types. A wildcard asterisk can be used in place of or in conjunction with the `type` argument to specify a range of bond types. This takes the form “*” or “*n” or “n*” or “m*n”. If `N` = the number of bond types, then an asterisk with no numeric values means all types from 1 to `N`. A leading asterisk means all types from 1 to `n` (inclusive). A trailing asterisk means all types from `n` to `N` (inclusive). A middle asterisk means all types from `m` to `n` (inclusive).

The specified `color` can be a single color which is any of the 140 pre-defined colors (see below) or a color name defined by the `dump_modify color` option. Or it can be two or more colors separated by a “/” character, e.g. red/green/blue. In the former case, that color is assigned to all the specified bond types. In the latter case, the list of colors are assigned in a round-robin fashion to each of the specified bond types.

The `bdiam` keyword can be used with the `dump image` command, with its `bond` keyword, when its diam setting is `type`, to set the diameter that bonds of each type will be drawn in the image. The specified `type` should be an integer from 1 to `Nbondtypes`. As with the `bcolor` keyword, a wildcard asterisk can be used as part of the `type` argument to specify a range of bond types. The specified `diam` is the size in whatever distance `units` you are using, e.g. Angstroms.

The `bitrate` keyword can be used with the `dump movie` command to define the size of the resulting movie file and its quality via setting how many kbits per second are to be used for the movie file. Higher bitrates require less compression and will result in higher quality movies. The quality is also determined by the compression format and encoder. The default setting is 2000 kbit/s, which will result in average quality with older compression formats.

**Note:** Not all movie file formats supported by `dump movie` allow the bitrate to be set. If not, the setting is silently ignored.

The `boxcolor` keyword sets the color of the simulation box drawn around the atoms in each image as well as the color of processor sub-domain boundaries. See the “dump image box” command for how to specify that a box be drawn via the `box` keyword, and the sub-domain boundaries via the `subbox` keyword. The color name can be any of the 140 pre-defined colors (see below) or a color name defined by the `dump_modify color` option.

The `color` keyword allows definition of a new color name, in addition to the 140-predefined colors (see below), and associates 3 red/green/blue RGB values with that color name. The color name can then be used with any other `dump_modify` keyword that takes a color name as a value. The RGB values should each be floating point values between 0.0 and 1.0 inclusive.

When a color name is converted to RGB values, the user-defined color names are searched first, then the 140 pre-defined color names. This means you can also use the `color` keyword to overwrite one of the pre-defined color names with new RBG values.
The framerate keyword can be used with the dump movie command to define the duration of the resulting movie file. Movie files written by the dump movie command have a default frame rate of 24 frames per second and the images generated will be converted at that rate. Thus a sequence of 1000 dump images will result in a movie of about 42 seconds. To make a movie run longer you can either generate images more frequently or lower the frame rate. To speed a movie up, you can do the inverse. Using a frame rate higher than 24 is not recommended, as it will result in simply dropping the rendered images. It is more efficient to dump images less frequently.

The COMPRESS package offers both GZ and Zstd compression variants of styles atom, custom, local, cfg, and xyz. When using these styles the compression level can be controlled by the compression_level parameter. File names with these styles have to end in either .gz or .zst.

GZ supports compression levels from -1 (default), 0 (no compression), and 1 to 9, 9 being the best compression. The COMPRESS /gz styles use 9 as default compression level.

Zstd offers a wider range of compression levels, including negative levels that sacrifice compression for performance. 0 is the default, positive levels are 1 to 22, with 22 being the most expensive compression. Zstd promises higher compression/decompression speeds for similar compression ratios. For more details see http://facebook.github.io/zstd/.

In addition, Zstd compressed files can have a checksum of the entire contents. The Zstd enabled dump styles enable this feature by default and it can be disabled with the checksum parameter.

### 17.42.4 Restrictions

none

### 17.42.5 Related commands

dump, dump image, undump

### 17.42.6 Default

The option defaults are

- append = no
- buffer = yes for dump styles atom, custom, loca, and xyz
- element = “C” for every atom type
- every = whatever it was set to via the dump command
- fileper = # of processors
- first = no
- flush = yes
- format = %d and %g for each integer or floating point value
- image = no
- label = ENTRIES
- maxfiles = -1
- nfile = 1

17.42. dump_modify command 617
• pad = 0
• pbc = no
• precision = 1000
• region = none
• scale = yes
• sort = off for dump styles atom, custom, cfg, and local
• sort = id for dump styles dcd, xtc, and xyz
• thresh = none
• units = no
• unwrap = no
• acolor = * red/green/blue/yellow/aqua/cyan
• adiam = * 1.0
• amap = min max cf 0.0 2 min blue max red
• backcolor = black
• bcolor = * red/green/blue/yellow/aqua/cyan
• bdiam = * 0.5
• bitrate = 2000
• boxcolor = yellow
• color = 140 color names are pre-defined as listed below
• framerate = 24
• compression_level = 9 (gz variants)
• compression_level = 0 (zstd variants)
• checksum = yes (zstd variants)

These are the standard 109 element names that LAMMPS pre-defines for use with the dump image and dump_modify commands.

• 11-20 = “Na”, “Mg”, “Al”, “Si”, “P”, “S”, “Cl”, “Ar”, “K”, “Ca”
• 41-50 = “Nb”, “Mo”, “Tc”, “Ru”, “Rh”, “Pd”, “Ag”, “Cd”, “In”, “Sn”
• 51-60 = “Sb”, “Te”, “I”, “Xe”, “Cs”, “Ba”, “La”, “Ce”, “Pr”, “Nd”
• 61-70 = “Pm”, “Sm”, “Eu”, “Gd”, “Tb”, “Dy”, “Ho”, “Er”, “Tm”, “Yb”
• 81-90 = “Tl”, “Pb”, “Bi”, “Po”, “At”, “Rn”, “Fr”, “Ra”, “Ac”, “Th”
• 91-100 = “Pa”, “U”, “Np”, “Pu”, “Am”, “Cm”, “Bk”, “Cf”, “Es”, “Fm”
These are the 140 colors that LAMMPS pre-defines for use with the dump image and dump_modify commands. Additional colors can be defined with the dump_modify color command. The 3 numbers listed for each name are the RGB (red/green/blue) values. Divide each value by 255 to get the equivalent 0.0 to 1.0 value.

17.43 dump molfile command

17.43.1 Syntax

```bash
dump ID group-ID molfile N file format path
```

- **ID** = user-assigned name for the dump
- **group-ID** = ID of the group of atoms to be imaged
- **molfile** = style of dump command (other styles `atom` or `cfg` or `dcd` or `xtc` or `xyz` or `local` or `custom` are discussed on the dump doc page)
- **N** = dump every this many timesteps
- **file** = name of file to write to
- **format** = file format to be used
- **path** = file path with plugins (optional)

17.43.2 Examples

```bash
dump mf1 all molfile 10 melt1.xml hoomd
dump mf2 all molfile 10 melt2-c.*.pdb pdb .
dump mf3 all molfile 50 melt3.xyz xyz .:/home/akohlmey/vmd/plugins/LINUX/molfile
```

17.43.3 Description

Dump a snapshot of atom coordinates and selected additional quantities to one or more files every N timesteps in one of several formats. Only information for atoms in the specified group is dumped. This specific dump style uses molfile plugins that are bundled with the VMD molecular visualization and analysis program.

Unless the filename contains a * character, the output will be written to one single file with the specified format. Otherwise there will be one file per snapshot and the * will be replaced by the time step number when the snapshot is written.

**Note:** Because periodic boundary conditions are enforced only on timesteps when neighbor lists are rebuilt, the coordinates of an atom written to a dump file may be slightly outside the simulation box.

The molfile plugin API has a few restrictions that have to be honored by this dump style: the number of atoms must not change, the atoms must be sorted, outside of the coordinates no change in atom properties (like type, mass, charge) will be recorded.

The `format` keyword determines what format is used to write out the dump. For this to work, LAMMPS must be able to find and load a compatible molfile plugin that supports this format. Settings made via the `dump_modify` command can alter per atom properties like element names.

The `path` keyword determines which in directories. This is a “path” like other search paths, i.e. it can contain multiple directories separated by a colon (or semi-colon on windows). This keyword is optional and default to “.”, the current directory.
The *unwrap* option of the *dump_modify* command allows coordinates to be written “unwrapped” by the image flags for each atom. Unwrapped means that if the atom has passed through a periodic boundary one or more times, the value is printed for what the coordinate would be if it had not been wrapped back into the periodic box. Note that these coordinates may thus be far outside the box size stored with the snapshot.

Dumps are performed on timesteps that are a multiple of N (including timestep 0) and on the last timestep of a minimization if the minimization converges. Note that this means a dump will not be performed on the initial timestep after the dump command is invoked, if the current timestep is not a multiple of N. This behavior can be changed via the *dump_modify first* command, which can be useful if the dump command is invoked after a minimization ended on an arbitrary timestep. N can be changed between runs by using the *dump_modify every* command. The *dump_modify every* command also allows a variable to be used to determine the sequence of timesteps on which dump files are written.

### 17.43.4 Restrictions

The *molfile* dump style is part of the USER-MOLFILE package. It is only enabled if LAMMPS was built with that package. See the *Build package* doc page for more info.

Molfile plugins provide a consistent programming interface to read and write file formats commonly used in molecular simulations. The USER-MOLFILE package only provides the interface code, not the plugins. These can be obtained from a VMD installation which has to match the platform that you are using to compile LAMMPS for. By adding plugins to VMD, support for new file formats can be added to LAMMPS (or VMD or other programs that use them) without having to re-compile the application itself. The plugins are installed in the directory: `<VMDHOME>/plugins/<VMDARCH>/molfile`

**Note:** while the programming interface (API) to the plugins is backward compatible, the binary interface (ABI) has been changing over time, so it is necessary to compile this package with the plugin header files from VMD that match the binary plugins. These header files in the directory: `<VMDHOME>/plugins/include` For convenience, the package ships with a set of header files that are compatible with VMD 1.9 and 1.9.1 (June 2012)

### 17.43.5 Related commands

*dump, dump_modify, undump*

### 17.43.6 Default

The default path is “.”. All other properties have to be specified.
17.44  dump netcdf command

17.45  dump netcdf/mpiio command

</tr>
</tbody>
</table>

17.45.3  Description

Dump a snapshot of atom coordinates every N timesteps in Amber-style NetCDF file format. NetCDF files are binary, portable and self-describing. This dump style will write only one file on the root node. The dump style netcdf uses the standard NetCDF library. All data is collected on one processor and then written to the dump file. Dump style netcdf/mpiio uses the parallel NetCDF library and MPI-IO to write to the dump file in parallel; it has better performance on a larger number of processors. Note that style netcdf outputs all atoms sorted by atom tag while style netcdf/mpiio outputs atoms in order of their MPI rank.

NetCDF files can be directly visualized via the following tools:

- Ovito (http://www.ovito.org/). Ovito supports the AMBER convention and all extensions of this dump style.
- VMD (http://www.ks.uiuc.edu/Research/vmd/).
- AtomEye (http://www.libatoms.org/). The libAtoms version of AtomEye contains a NetCDF reader that is not present in the standard distribution of AtomEye.

In addition to per-atom data, thermo data can be included in the dump file. The data included in the dump file is identical to the data specified by thermo_style.
17.45.4 Restrictions

The netcdf and netcdf/mpiio dump styles are part of the USER-NETCDF package. They are only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

17.45.5 Related commands

dump, dump_modify, undump

17.46 dump vtk command

17.46.1 Syntax

\texttt{dump \textit{ID} \textit{group-ID} \textit{vtk} \textit{N} \textit{file} \textit{args}}

- \textit{ID} = user-assigned name for the dump
- \textit{group-ID} = ID of the group of atoms to be dumped
- \textit{vtk} = style of dump command (other styles atom or cfg or dcd or xtc or xyz or local or custom are discussed on the dump doc page)
- \textit{N} = dump every this many timesteps
- \textit{file} = name of file to write dump info to
- \textit{args} = same as arguments for \textit{dump_style custom}

17.46.2 Examples

\begin{verbatim}
dump dmpvtk all vtk 100 dump*.myforce.vtk id type vx fx
\end{verbatim}

17.46.3 Description

Dump a snapshot of atom quantities to one or more files every \textit{N} timesteps in a format readable by the VTK visualization toolkit or other visualization tools that use it, e.g. ParaView. The timesteps on which dump output is written can also be controlled by a variable; see the \textit{dump_modify every} command for details.

This dump style is similar to \textit{dump_style custom} but uses the VTK library to write data to VTK simple legacy or XML format depending on the filename extension specified for the dump file. This can be either *.vtk for the legacy format or *.vtp and *.vtu, respectively, for XML format; see the VTK homepage for a detailed description of these formats. Since this naming convention conflicts with the way binary output is usually specified (see below), the \textit{dump_modify binary} command allows setting of a binary option for this dump style explicitly.

Only information for atoms in the specified group is dumped. The \textit{dump_modify thresh} and \textit{region} commands can also alter what atoms are included; see details below.

As described below, special characters (“*”, “%”) in the filename determine the kind of output.
Warning: Because periodic boundary conditions are enforced only on timesteps when neighbor lists are rebuilt, the coordinates of an atom written to a dump file may be slightly outside the simulation box.

Warning: Unless the dump_modify sort option is invoked, the lines of atom information written to dump files will be in an indeterminate order for each snapshot. This is even true when running on a single processor, if the atom_modify sort option is on, which it is by default. In this case atoms are re-ordered periodically during a simulation, due to spatial sorting. It is also true when running in parallel, because data for a single snapshot is collected from multiple processors, each of which owns a subset of the atoms.

For the vtk style, sorting is off by default. See the dump_modify doc page for details.

The dimensions of the simulation box are written to a separate file for each snapshot (either in legacy VTK or XML format depending on the format of the main dump file) with the suffix _boundingBox appended to the given dump filename.

For an orthogonal simulation box this information is saved as a rectilinear grid (legacy .vtk or .vtr XML format).

Triclinic simulation boxes (non-orthogonal) are saved as hexahedrons in either legacy .vtk or .vtu XML format.

Style vtk allows you to specify a list of atom attributes to be written to the dump file for each atom. The list of possible attributes is the same as for the dump_style custom command; see its doc page for a listing and an explanation of each attribute.

Note: Since position data is required to write VTK files the atom attributes “x y z” do not have to be specified explicitly; they will be included in the dump file regardless. Also, in contrast to the custom style, the specified vtk attributes are rearranged to ensure correct ordering of vector components (except for computes and fixes - these have to be given in the right order) and duplicate entries are removed.

The VTK format uses a single snapshot of the system per file, thus a wildcard “*” must be included in the filename, as discussed below. Otherwise the dump files will get overwritten with the new snapshot each time.

Dumps are performed on timesteps that are a multiple of N (including timestep 0) and on the last timestep of a minimization if the minimization converges. Note that this means a dump will not be performed on the initial timestep after the dump command is invoked, if the current timestep is not a multiple of N. This behavior can be changed via the dump_modify first command, which can also be useful if the dump command is invoked after a minimization ended on an arbitrary timestep. N can be changed between runs by using the dump_modify every command. The dump_modify every command also allows a variable to be used to determine the sequence of timesteps on which dump files are written. In this mode a dump on the first timestep of a run will also not be written unless the dump_modify first command is used.

Dump filenames can contain two wildcard characters. If a “*” character appears in the filename, then one file per snapshot is written and the “*” character is replaced with the timestep value. For example, tmp.dump*.vtk becomes tmp.dump0.vtk, tmp.dump10000.vtk, tmp.dump20000.vtk, etc. Note that the dump_modify pad command can be used to insure all timestep numbers are the same length (e.g. 00010), which can make it easier to read a series of dump files in order with some post-processing tools.

If a “%” character appears in the filename, then each of P processors writes a portion of the dump file, and the “%” character is replaced with the processor ID from 0 to P-1 preceded by an underscore character. For example, tmp.dump%.vtp becomes tmp.dump_0.vtp, tmp.dump_1.vtp, . . . tmp.dump_P-1.vtp, etc. This creates smaller files and can be a fast mode of output on parallel machines that support parallel I/O for output.
By default, \( P \) = the number of processors meaning one file per processor, but \( P \) can be set to a smaller value via the `nfile` or `fileper` keywords of the `dump_modify` command. These options can be the most efficient way of writing out dump files when running on large numbers of processors.

For the legacy VTK format “%” is ignored and \( P = 1 \), i.e., only processor 0 does write files.

Note that using the “*” and “%” characters together can produce a large number of small dump files!

If `dump_modify binary` is used, the dump file (or files, if “*” or “%” is also used) is written in binary format. A binary dump file will be about the same size as a text version, but will typically write out much faster.

17.46.4 Restrictions

The `vtk` style does not support writing of gzipped dump files.

The `vtk` dump style is part of the USER-VTK package. It is only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

To use this dump style, you also must link to the VTK library. See the info in lib/vtk/README and insure the Makefile.lammps file in that directory is appropriate for your machine.

The `vtk` dump style supports neither buffering or custom format strings.

17.46.5 Related commands

`dump`, `dump image`, `dump_modify`, `undump`

17.46.6 Default

By default, files are written in ASCII format. If the file extension is not one of `.vtk`, `.vtp` or `.vtu`, the legacy VTK file format is used.

17.47 dynamical_matrix command

17.47.1 Syntax

```
dynamical_matrix group-ID style gamma args keyword value ...
```

- `group-ID` = ID of group of atoms to displace
- `style` = `regular` or `eskm`
- `gamma` = finite different displacement length (distance units)
- one or more keyword/arg pairs may be appended
  
  `keyword` = `file` or `binary`
  
  `file name` = name of output file for the dynamical matrix
  `binary arg` = `yes` or `no` or `gzip`
17.47.2 Examples

| dynamical_matrix | 1 regular 0.000001 |
| dynamical_matrix | 1 eskm 0.000001 |
| dynamical_matrix | 3 regular 0.000004 file dynmat.dat |
| dynamical_matrix | 5 eskm 0.00000001 file dynamical.dat binary yes |

17.47.3 Description

Calculate the dynamical matrix by finite difference of the selected group,

\[ D = \frac{\Phi_{ij}^{\alpha\beta}}{\sqrt{M_i M_j}} \]

where \( D \) is the dynamical matrix and \( \Phi \) is the force constant matrix defined by

\[ \Phi_{ij}^{\alpha\beta} = \frac{\partial^2 U}{\partial x_i,\alpha \partial x_j,\beta} \]

The output for the dynamical matrix is printed three elements at a time. The three elements are the three \( \beta \) elements for a respective \( i/\alpha/j \) combination. Each line is printed in order of \( j \) increasing first, \( \alpha \) second, and \( i \) last.

If the style eskm is selected, the dynamical matrix will be in units of inverse squared femtoseconds. These units will then conveniently leave frequencies in THz.

17.47.4 Restrictions

The command collects an array of nine times the number of atoms in a group on every single MPI rank, so the memory requirements can be very significant for large systems.

This command is part of the USER-PHONON package. It is only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

17.47.5 Related commands

fix phonon, fix numdiff, compute hma

`compute hma` uses an analytic formulation of the Hessian provided by a pair_style’s Pair::single_hessian() function, if implemented.

17.47.6 Default

The default settings are file = “dynmat.dat”, binary = no
17.48 echo command

17.48.1 Syntax

```
echo style
```

- style = none or screen or log or both

17.48.2 Examples

```
echo both
echo log
```

17.48.3 Description

This command determines whether LAMMPS echoes each input script command to the screen and/or log file as it is read and processed. If an input script has errors, it can be useful to look at echoed output to see the last command processed.

The command-line switch -echo can be used in place of this command.

17.48.4 Restrictions

none

17.48.5 Related commands

none

17.48.6 Default

```
echo log
```

17.49 fix command

17.49.1 Syntax

```
fix ID group-ID style args
```

- ID = user-assigned name for the fix
- group-ID = ID of the group of atoms to apply the fix to
- style = one of a long list of possible style names (see below)
- args = arguments used by a particular style
17.49.2 Examples

```plaintext
fix 1 all nve
fix 3 all nvt temp 300.0 300.0 0.01
fix mine top setforce 0.0 NULL 0.0
```

17.49.3 Description

Set a fix that will be applied to a group of atoms. In LAMMPS, a “fix” is any operation that is applied to the system during time stepping or minimization. Examples include updating of atom positions and velocities due to time integration, controlling temperature, applying constraint forces to atoms, enforcing boundary conditions, computing diagnostics, etc. There are hundreds of fixes defined in LAMMPS and new ones can be added; see the Modify doc page for details.

Fixes perform their operations at different stages of the timestep. If 2 or more fixes operate at the same stage of the timestep, they are invoked in the order they were specified in the input script.

The ID of a fix can only contain alphanumeric characters and underscores.

Fixes can be deleted with the `unfix` command.

**Note:** The `unfix` command is the only way to turn off a fix; simply specifying a new fix with a similar style will not turn off the first one. This is especially important to realize for integration fixes. For example, using a `fix nve` command for a second run after using a `fix nvt` command for the first run, will not cancel out the NVT time integration invoked by the “fix nvt” command. Thus two time integrators would be in place!

If you specify a new fix with the same ID and style as an existing fix, the old fix is deleted and the new one is created (presumably with new settings). This is the same as if an “unfix” command were first performed on the old fix, except that the new fix is kept in the same order relative to the existing fixes as the old one originally was. Note that this operation also wipes out any additional changes made to the old fix via the `fix_modify` command.

The `fix modify` command allows settings for some fixes to be reset. See the doc page for individual fixes for details.

Some fixes store an internal “state” which is written to binary restart files via the `restart` or `write_restart` commands. This allows the fix to continue on with its calculations in a restarted simulation. See the `read_restart` command for info on how to re-specify a fix in an input script that reads a restart file. See the doc pages for individual fixes for info on which ones can be restarted.

Some fixes calculate one of three styles of quantities: global, per-atom, or local, which can be used by other commands or output as described below. A global quantity is one or more system-wide values, e.g. the energy of a wall interacting with particles. A per-atom quantity is one or more values per atom, e.g. the displacement vector for each atom since time 0. Per-atom values are set to 0.0 for atoms not in the specified fix group. Local quantities are calculated by each processor based on the atoms it owns, but there may be zero or more per atoms.

Note that a single fix can produce either global or per-atom or local quantities (or none at all), but not both global and per-atom. It can produce local quantities in tandem with global or per-atom quantities. The fix doc page will explain.

Global, per-atom, and local quantities each come in three kinds: a single scalar value, a vector of values, or a 2d array of values. The doc page for each fix describes the style and kind of values it produces, e.g. a per-atom vector. Some fixes produce more than one kind of a single style, e.g. a global scalar and a global vector.

When a fix quantity is accessed, as in many of the output commands discussed below, it can be referenced via the following bracket notation, where ID is the ID of the fix:
In other words, using one bracket reduces the dimension of the quantity once (vector -> scalar, array -> vector). Using two brackets reduces the dimension twice (array -> scalar). Thus a command that uses scalar fix values as input can also process elements of a vector or array.

Note that commands and variables which use fix quantities typically do not allow for all kinds, e.g. a command may require a vector of values, not a scalar. This means there is no ambiguity about referring to a fix quantity as \texttt{f\_ID} even if it produces, for example, both a scalar and vector. The doc pages for various commands explain the details.

In LAMMPS, the values generated by a fix can be used in several ways:

- Global values can be output via the \texttt{thermo\_style custom} or \texttt{fix ave/time} command. Or the values can be referenced in a \texttt{variable equal} or \texttt{variable atom} command.
- Per-atom values can be output via the \texttt{dump custom} command. Or they can be time-averaged via the \texttt{fix ave/atom} command or reduced by the \texttt{compute reduce} command. Or the per-atom values can be referenced in an \texttt{atom-style variable}.
- Local values can be reduced by the \texttt{compute reduce} command, or histogrammed by the \texttt{fix ave/histo} command.

See the \texttt{Howto output} doc page for a summary of various LAMMPS output options, many of which involve fixes.

The results of fixes that calculate global quantities can be either “intensive” or “extensive” values. Intensive means the value is independent of the number of atoms in the simulation, e.g. temperature. Extensive means the value scales with the number of atoms in the simulation, e.g. total rotational kinetic energy. Thermodynamic output will normalize extensive values by the number of atoms in the system, depending on the “thermo\_modify norm” setting. It will not normalize intensive values. If a fix value is accessed in another way, e.g. by a \texttt{variable}, you may want to know whether it is an intensive or extensive value. See the doc page for individual fixes for further info.

Each fix style has its own doc page which describes its arguments and what it does, as listed below. Here is an alphabetic list of fix styles available in LAMMPS. They are also listed in more compact form on the \texttt{Commands fix} doc page.

There are also additional accelerated fix styles included in the LAMMPS distribution for faster performance on CPUs, GPUs, and KNLs. The individual style names on the \texttt{Commands fix} doc page are followed by one or more of \texttt{(g,i,k,o,t)} to indicate which accelerated styles exist.
• `ave/correlate` - compute/output time correlations
• `ave/correlate/long` -
• `ave/histo` - compute/output time-averaged histograms
• `ave/histo/weight` - weighted version of fix ave/histo
• `ave/time` - compute/output global time-averaged quantities
• `aveforce` - add an averaged force to each atom
• `balance` - perform dynamic load-balancing
• `bocs` - NPT style time integration with pressure correction
• `bond/break` - break bonds on the fly
• `bond/create` - create bonds on the fly
• `bond/create/angle` - create bonds on the fly with angle constraints
• `bond/react` - apply topology changes to model reactions
• `bond/swap` - Monte Carlo bond swapping
• `box/relax` - relax box size during energy minimization
• `client/md` - MD client for client/server simulations
• `cmap` - enables CMAP cross-terms of the CHARMM force field
• `colvars` - interface to the collective variables “Colvars” library
• `controller` - apply control loop feedback mechanism
• `deform` - change the simulation box size/shape
• `deposit` - add new atoms above a surface
• `dpd/energy` - constant energy dissipative particle dynamics
• `drag` - drag atoms towards a defined coordinate
• `drude` - part of Drude oscillator polarization model
• `drude/transform/direct` - part of Drude oscillator polarization model
• `drude/transform/inverse` - part of Drude oscillator polarization model
• `dt/reset` - reset the timestep based on velocity, forces
• `edpd/source` - add heat source to eDPD simulations
• `efield` - impose electric field on system
• `ehex` - enhanced heat exchange algorithm
• `electron/stopping` - electronic stopping power as a friction force
• `enforce2d` - zero out z-dimension velocity and force
• `eos/cv` -
• `eos/table` -
• `eos/table/rx` -
• `evaporate` - remove atoms from simulation periodically
• `external` - callback to an external driver program
• \textit{ffl} - apply a Fast-Forward Langevin equation thermostat
• \textit{filter/corotate} - implement corotation filter to allow larger timesteps with r-RESPA
• \textit{flow/ gauss} - Gaussian dynamics for constant mass flux
• \textit{freeze} - freeze atoms in a granular simulation
• \textit{gcme} - grand canonical insertions/deletions
• \textit{gld} - generalized Langevin dynamics integrator
• \textit{gle} - generalized Langevin equation thermostat
• \textit{gravity} - add gravity to atoms in a granular simulation
• \textit{grem} - implements the generalized replica exchange method
• \textit{halt} - terminate a dynamics run or minimization
• \textit{heat} - add/subtract momentum-conserving heat
• \textit{hyper/global} - global hyperdynamics
• \textit{hyper/local} - local hyperdynamics
• \textit{imd} - implements the “Interactive MD” (IMD) protocol
• \textit{indent} - impose force due to an indenter
• \textit{ipi} - enable LAMMPS to run as a client for i-PI path-integral simulations
• \textit{langevin} - Langevin temperature control
• \textit{langevin/drude} - Langevin temperature control of Drude oscillators
• \textit{langevin/eef} - Langevin temperature control for the electron force field model
• \textit{langevin/spin} - Langevin temperature control for a spin or spin-lattice system
• \textit{latte} - wrapper on LATTE density-functional tight-binding code
• \textit{lb/ fluid} -
• \textit{lb/momentum} -
• \textit{lb} -
• \textit{lb/rigid/ pc/ sphere} -
• \textit{lb/viscous} -
• \textit{lineforce} - constrain atoms to move in a line
• \textit{manifoldforce} - restrain atoms to a manifold during minimization
• \textit{meso/move} - move mesoscopic SPH/SDPD particles in a prescribed fashion
• \textit{momentum} - zero the linear and/or angular momentum of a group of atoms
• \textit{momentum/chunk} - zero the linear and/or angular momentum of a chunk of atoms
• \textit{move} - move atoms in a prescribed fashion
• \textit{mscg} - apply MSCG method for force-matching to generate coarse grain models
• \textit{msst} - multi-scale shock technique (MSST) integration
• \textit{mvv/ dpd} - DPD using the modified velocity-Verlet integration algorithm
• \textit{mvv/ edpd} - constant energy DPD using the modified velocity-Verlet algorithm
• **mvv/tdpd** - constant temperature DPD using the modified velocity-Verlet algorithm
• **neb** - nudged elastic band (NEB) spring forces
• **neb/spin** - nudged elastic band (NEB) spring forces for spins
• **nph** - constant NPH time integration via Nose/Hoover
• **nph/asphere** - NPH for aspherical particles
• **nph/body** - NPH for body particles
• **nph/eff** - NPH for nuclei and electrons in the electron force field model
• **nph/sphere** - NPH for spherical particles
• **nphug** - constant-stress Hugoniostat integration
• **npt** - constant NPT time integration via Nose/Hoover
• **npt/asphere** - NPT for aspherical particles
• **npt/body** - NPT for body particles
• **npt/cauchy** - NPT with Cauchy stress
• **npt/eff** - NPT for nuclei and electrons in the electron force field model
• **npt/sphere** - NPT for spherical particles
• **npt/uef** - NPT style time integration with diagonal flow
• **numdiff** - compute derivatives of per-atom data from finite differences
• **nve** - constant NVE time integration
• **nve/asphere** - NVE for aspherical particles
• **nve/asphe/noforce** - NVE for aspherical particles without forces
• **nve/awpmd** - NVE for the Antisymmetrized Wave Packet Molecular Dynamics model
• **nve/body** - NVE for body particles
• **nve/dot** - rigid body constant energy time integrator for coarse grain models
• **nve/dotc/langevin** - Langevin style rigid body time integrator for coarse grain models
• **nve/eff** - NVE for nuclei and electrons in the electron force field model
• **nve/limit** - NVE with limited step length
• **nve/line** - NVE for line segments
• **nve/manifold/rattle** -
• **nve/noforce** - NVE without forces (v only)
• **nve/sphere** - NVE for spherical particles
• **nve/spin** - NVE for a spin or spin-lattice system
• **nve/tri** - NVE for triangles
• **nvk** - constant kinetic energy time integration
• **nvt** - NVT time integration via Nose/Hoover
• **nvt/asphere** - NVT for aspherical particles
• **nvt/body** - NVT for body particles
• **nvt/eff** - NVE for nuclei and electrons in the electron force field model
• **nvt/manifold/rattle** -
• **nvt/sllod** - NVT for NEMD with SLLOD equations
• **nvt/sllod/eff** - NVT for NEMD with SLLOD equations for the electron force field model
• **nvt/sphere** - NVT for spherical particles
• **nvt/uef** - NVT style time integration with diagonal flow
• **oneway** - constrain particles on move in one direction
• **orient/bcc** - add grain boundary migration force for BCC
• **orient/fcc** - add grain boundary migration force for FCC
• **orient/eco** - add generalized grain boundary migration force
• **pafi** - constrained force averages on hyper-planes to compute free energies (PAFI)
• **phonon** - calculate dynamical matrix from MD simulations
• **pimd** - Feynman path integral molecular dynamics
• **planeforce** - constrain atoms to move in a plane
• **plumed** - wrapper on PLUMED free energy library
• **poems** - constrain clusters of atoms to move as coupled rigid bodies
• **pour** - pour new atoms/molecules into a granular simulation domain
• **precession/spin** -
• **press/berendsen** - pressure control by Berendsen barostat
• **print** - print text and variables during a simulation
• **propel/self** - model self-propelled particles
• **property/atom** - add customized per-atom values
• **python/invoke** - call a Python function during a simulation
• **python/move** - call a Python function during a simulation run
• **qbmsst** - quantum bath multi-scale shock technique time integrator
• **qeq/comb** - charge equilibration for COMB potential
• **qeq/dynamic** - charge equilibration via dynamic method
• **qeq/fire** - charge equilibration via FIRE minimizer
• **qeq/point** - charge equilibration via point method
• **qeq/reax** - charge equilibration for ReaxFF potential
• **qeq/shielded** - charge equilibration via shielded method
• **qeq/slater** - charge equilibration via Slater method
• **qmmm** - functionality to enable a quantum mechanics/molecular mechanics coupling
• **qtb** - implement quantum thermal bath scheme
• **rattle** - RATTLE constraints on bonds and/or angles
• **reax/c/bonds** - write out ReaxFF bond information
- **reax/c/species** - write out ReaxFF molecule information
- **recenter** - constrain the center-of-mass position of a group of atoms
- **restrain** - constrain a bond, angle, dihedral
- **rhok** - add bias potential for long-range ordered systems
- **rigid** - constrain one or more clusters of atoms to move as a rigid body with NVE integration
- **rigid/meso** - constrain clusters of mesoscopic SPH/SDPD particles to move as a rigid body
- **rigid/nph** - constrain one or more clusters of atoms to move as a rigid body with NPH integration
- **rigid/nph/small** - constrain many small clusters of atoms to move as a rigid body with NPH integration
- **rigid/npt** - constrain one or more clusters of atoms to move as a rigid body with NPT integration
- **rigid/npt/small** - constrain many small clusters of atoms to move as a rigid body with NPT integration
- **rigid/nve** - constrain one or more clusters of atoms to move as a rigid body with alternate NVE integration
- **rigid/nve/small** - constrain many small clusters of atoms to move as a rigid body with alternate NVE integration
- **rigid/nvt** - constrain one or more clusters of atoms to move as a rigid body with NVT integration
- **rigid/nvt/small** - constrain many small clusters of atoms to move as a rigid body with NVT integration
- **rigid/small** - constrain many small clusters of atoms to move as a rigid body with NVE integration
- **rx** -
- **saed/vtk** -
- **setforce** - set the force on each atom
- **setforce/spin** - set magnetic precession vectors on each atom
- **shake** - SHAKE constraints on bonds and/or angles
- **shardlow** - integration of DPD equations of motion using the Shardlow splitting
- **smd** - applied a steered MD force to a group
- **smd/adjust_dt** -
- **smd/integrate_tlsph** -
- **smd/integrate_ulsph** -
- **smd/move_tri_surf** -
- **smd/setvel** -
- **smd/wall_surface** -
- **sph** - time integration for SPH/DPDE particles
- **sph/stationary** -
- **spring** - apply harmonic spring force to group of atoms
- **spring/chunk** - apply harmonic spring force to each chunk of atoms
- **spring/rg** - spring on radius of gyration of group of atoms
- **spring/self** - spring from each atom to its origin
- **srd** - stochastic rotation dynamics (SRD)
- **store/force** - store force on each atom
• **store/state** - store attributes for each atom

• **tdpd/source** -

• **temp/berendsen** - temperature control by Berendsen thermostat

• **temp/cslid** - canonical sampling thermostat with Langevin dynamics

• **temp/csvr** - canonical sampling thermostat with Hamiltonian dynamics

• **temp/rescale** - temperature control by velocity rescaling

• **temp/rescale/eff** - temperature control by velocity rescaling in the electron force field model

• **tfmc** - perform force-bias Monte Carlo with time-stamped method

• **thermal/conductivity** - Muller-Plathe kinetic energy exchange for thermal conductivity calculation

• **ti/spring** -

• **tmd** - guide a group of atoms to a new configuration

• **ttm** - two-temperature model for electronic/atomic coupling

• **ttm/mod** - enhanced two-temperature model with additional options

• **tune/kspace** - auto-tune KSpace parameters

• **vector** - accumulate a global vector every N timesteps

• **viscosity** - Muller-Plathe momentum exchange for viscosity calculation

• **viscous** - viscous damping for granular simulations

• **wall/body/polygon** -

• **wall/body/polyhedron** -

• **wall/collloid** - Lennard-Jones wall interacting with finite-size particles

• **wall/ees** - wall for ellipsoidal particles

• **wall/gran** - frictional wall(s) for granular simulations

• **wall/gran/region** -

• **wall/harmonic** - harmonic spring wall

• **wall/lj1043** - Lennard-Jones 10-4-3 wall

• **wall/lj126** - Lennard-Jones 12-6 wall

• **wall/lj93** - Lennard-Jones 9-3 wall

• **wall/morse** - Morse potential wall

• **wall/piston** - moving reflective piston wall

• **wall/reflect** - reflecting wall(s)

• **wall/reflect/stochastic** - reflecting wall(s) with finite temperature

• **wall/region** - use region surface as wall

• **wall/region/ees** - use region surface as wall for ellipsoidal particles

• **wall/srd** - slip/no-slip wall for SRD particles

• **widom** - Widom insertions of atoms or molecules
17.49.4 Restrictions

Some fix styles are part of specific packages. They are only enabled if LAMMPS was built with that package. See the `Build package` doc page for more info. The doc pages for individual fixes tell if it is part of a package.

17.49.5 Related commands

`unfix`, `fix_modify`

17.49.6 Default

`none`

17.50 `fix_modify` command

17.50.1 Syntax

```
fix_modify  fix-ID keyword value ...
```

- `fix-ID` = ID of the fix to modify
- one or more keyword/value pairs may be appended
- keyword = `temp` or `press` or `energy` or `virial` or `respa` or `dynamic/dof` or `bodyforces`
  - `temp` value = compute ID that calculates a temperature
  - `press` value = compute ID that calculates a pressure
  - `energy` value = yes or no
  - `virial` value = yes or no
  - `respa` value = 1 to max respa level or 0 (for outermost level)
  - `dynamic/dof` value = yes or no
    - yes/no = do or do not re-compute the number of degrees of freedom (DOF) contributing to the temperature
  - `bodyforces` value = early or late
    - early/late = compute rigid-body forces/torques early or late in the timestep

17.50.2 Examples

```
fix_modify 3 temp myTemp press myPress
fix_modify 1 energy yes
fix_modify tether respa 2
```
17.50.3 Description

Modify one or more parameters of a previously defined fix. Only specific fix styles support specific parameters. See the doc pages for individual fix commands for info on which ones support which fix_modify parameters.

The \texttt{temp} keyword is used to determine how a fix computes temperature. The specified compute ID must have been previously defined by the user via the \texttt{compute} command and it must be a style of compute that calculates a temperature. All fixes that compute temperatures define their own compute by default, as described in their documentation. Thus this option allows the user to override the default method for computing $T$.

The \texttt{press} keyword is used to determine how a fix computes pressure. The specified compute ID must have been previously defined by the user via the \texttt{compute} command and it must be a style of compute that calculates a pressure. All fixes that compute pressures define their own compute by default, as described in their documentation. Thus this option allows the user to override the default method for computing $P$.

The \texttt{energy} keyword can be used with fixes that support it. \texttt{energy yes} adds a contribution to the potential energy of the system. The fix’s global and per-atom energy is included in the calculation performed by the \texttt{compute pe} or \texttt{compute pe/atom} commands. See the \texttt{thermo_style} command for info on how potential energy is output. For fixes that tally a global energy, it can be printed by using the keyword f\_ID in the \texttt{thermo_style} custom command, where ID is the fix-ID of the appropriate fix.

\textbf{Note:} You must also specify the \texttt{energy yes} setting for a fix if you are using it when performing an \texttt{energy minimization} and if you want the energy and forces it produces to be part of the optimization criteria.

The \texttt{virial} keyword can be used with fixes that support it. \texttt{virial yes} adds a contribution to the virial of the system. The fix’s global and per-atom virial is included in the calculation performed by the \texttt{compute pressure} or \texttt{compute stress/atom} commands. See the \texttt{thermo_style} command for info on how pressure is output.

\textbf{Note:} You must specify the \texttt{virial yes} setting for a fix if you are doing box relaxation and if you want virial contribution of the fix to be part of the relaxation criteria, although this seems unlikely.

\textbf{Note:} This option is only supported by fixes that explicitly say so. For some of these (e.g. the \texttt{fix shake} command) the default setting is \texttt{virial yes}, for others it is \texttt{virial no}.

For fixes that set or modify forces, it may be possible to select at which \texttt{r-RESPA} level the fix operates via the \texttt{respa} keyword. The \texttt{RESPA} level at which the fix is active can be selected. This is a number ranging from 1 to the number of levels. If the \texttt{RESPA} level is larger than the current maximum, the outermost level will be used, which is also the default setting. This default can be restored using a value of 0 for the \texttt{RESPA} level. The affected fix has to be enabled to support this feature; if not, \texttt{fix modify} will report an error. Active fixes with a custom \texttt{RESPA} level setting are reported with their specified level at the beginning of a \texttt{r-RESPA} run.

The \texttt{dynamic/dof} keyword determines whether the number of atoms $N$ in the fix group and their associated degrees of freedom are re-computed each time a temperature is computed. Only fix styles that calculate their own internal temperature use this option. Currently this is only the \texttt{fix rigid/nvt/small} and \texttt{fix rigid/npt/small} commands for the purpose of thermostating rigid body translation and rotation. By default, $N$ and their DOF are assumed to be constant. If you are adding atoms or molecules to the system (see the \texttt{fix pour}, \texttt{fix deposit}, and \texttt{fix gcmc} commands) or expect atoms or molecules to be lost (e.g. due to exiting the simulation box or via \texttt{fix evaporate}), then this option should be used to insure the temperature is correctly normalized.

\textbf{Note:} Other thermostating fixes, such as \texttt{fix nvt}, do not use the \texttt{dynamic/dof} keyword because they use a temperature compute to calculate temperature. See the \texttt{compute_modify dynamic/dof} command for a similar way to insure correct
temperature normalization for those thermostats.

The `bodyforces` keyword determines whether the forces and torques acting on rigid bodies are computed early at the post-force stage of each timestep (right after per-atom forces have been computed and communicated among processors), or late at the final-integrate stage of each timestep (after any other fixes have finished their post-force tasks). Only the rigid-body integration fixes use this option, which includes `fix rigid` and `fix rigid/small`, and their variants, and also `fix poems`.

The default is late. If there are other fixes that add forces to individual atoms, then the rigid-body constraints will include these forces when time-integrating the rigid bodies. If early is specified, then new fixes can be written that use or modify the per-body force and torque, before time-integration of the rigid bodies occurs. Note however this has the side effect, that fixes such as `fix addforce`, `fix setforce`, `fix spring`, which add forces to individual atoms will have no effect on the motion of the rigid bodies if they are specified in the input script after the fix rigid command. LAMMPS will give a warning if that is the case.

17.50.4 Restrictions

none

17.50.5 Related commands

`fix`, `compute temp`, `compute pressure`, `thermo_style`

17.50.6 Default

The option defaults are `temp = ID defined by fix`, `press = ID defined by fix`, `energy = no`, `virial = different for each fix style`, `respa = 0`, `bodyforce = late`.

17.51 group command

17.51.1 Syntax

```
group ID style args
```

- **ID** = user-defined name of the group
- **style** = `delete` or `clear` or `empty` or `region` or `type` or `id` or `molecule` or `variable` or `include` or `subtract` or `union` or `intersect` or `dynamic` or `static`
  - `delete = no args`
  - `clear = no args`
  - `empty = no args`
  - `region args = region-ID`

17.51.3 Description

Identify a collection of atoms as belonging to a group. The group ID can then be used in other commands such as fix, compute, dump, or velocity to act on those atoms together.

If the group ID already exists, the group command adds the specified atoms to the group.

Note: By default groups are static, meaning the atoms are permanently assigned to the group. For example, if the region style is used to assign atoms to a group, the atoms will remain in the group even if they later move out of the region. As explained below, the dynamic style can be used to make a group dynamic so that a periodic determination is made as to which atoms are in the group. Since many LAMMPS commands operate on groups of atoms, you should think carefully about whether making a group dynamic makes sense for your model.

A group with the ID all is predefined. All atoms belong to this group. This group cannot be deleted, or made dynamic.
The *delete* style removes the named group and un-assigns all atoms that were assigned to that group. Since there is a restriction (see below) that no more than 32 groups can be defined at any time, the *delete* style allows you to remove groups that are no longer needed, so that more can be specified. You cannot delete a group if it has been used to define a current *fix* or *compute* or *dump*.

The *clear* style un-assigns all atoms that were assigned to that group. This may be dangerous to do during a simulation run, e.g. using the *run every* command if a fix or compute or other operation expects the atoms in the group to remain constant, but LAMMPS does not check for this.

The *empty* style creates an empty group, which is useful for commands like *fix gcmc* or with complex scripts that add atoms to a group.

The *region* style puts all atoms in the region volume into the group. Note that this is a static one-time assignment. The atoms remain assigned (or not assigned) to the group even in they later move out of the region volume.

The *type*, *id*, and *molecule* styles put all atoms with the specified atom types, atom IDs, or molecule IDs into the group. These 3 styles can use arguments specified in one of two formats.

The first format is a list of values (types or IDs). For example, the second command in the examples above puts all atoms of type 3 or 4 into the group named *water*. Each entry in the list can be a colon-separated sequence A:B or A:B:C, as in two of the examples above. A “sequence” generates a sequence of values (types or IDs), with an optional increment. The first example with 500:1000 has the default increment of 1 and would add all atom IDs from 500 to 1000 (inclusive) to the group sub, along with 10,25,50 since they also appear in the list of values. The second example with 100:10000:10 uses an increment of 10 and would thus would add atoms IDs 100,110,120, … 9990,10000 to the group sub.

The second format is a *logical* followed by one or two values (type or ID). The 7 valid logicals are listed above. All the logicals except <> take a single argument. The third example above adds all atoms with IDs from 1 to 150 to the group named *sub*. The logical <> means “between” and takes 2 arguments. The fourth example above adds all atoms belonging to molecules with IDs from 50 to 250 (inclusive) to the group named *polyA*.

The *variable* style evaluates a variable to determine which atoms to add to the group. It must be an *atom-style variable* previously defined in the input script. If the variable evaluates to a non-zero value for a particular atom, then that atom is added to the specified group.

Atom-style variables can specify formulas that include thermodynamic quantities, per-atom values such as atom coordinates, or per-atom quantities calculated by computes, fixes, or other variables. They can also include Boolean logic where 2 numeric values are compared to yield a 1 or 0 (effectively a true or false). Thus using the *variable* style, is a general way to flag specific atoms to include or exclude from a group.

For example, these lines define a variable “*eatom*” that calculates the potential energy of each atom and includes it in the group if its potential energy is above the threshold value -3.0.

```
calculate 1 all pe/atom
calculate 2 all reduce sum c_1
thermo_style custom step temp pe c_2
run 0
variable eatom "c_1 > -3.0"
group hienergy variable eatom
```

Note that these lines

```
calculate 2 all reduce sum c_1
thermo_style custom step temp pe c_2
run 0
```

are necessary to insure that the “eatom” variable is current when the group command invokes it. Because the eatom variable computes the per-atom energy via the pe/atom compute, it will only be current if a run has been performed.
which evaluated pairwise energies, and the pe/atom compute was actually invoked during the run. Printing the ther-
modynamic info for compute 2 insures that this is the case, since it sums the pe/atom compute values (in the reduce compute) to output them to the screen. See the “Variable Accuracy” section of the variable doc page for more details on insuring that variables are current when they are evaluated between runs.

The include style with its arg molecule adds atoms to a group that have the same molecule ID as atoms already in the group. The molecule ID = 0 is ignored in this operation, since it is assumed to flag isolated atoms that are not part of molecules. An example of where this operation is useful is if the region style has been used previously to add atoms to a group that are within a geometric region. If molecules straddle the region boundary, then atoms outside the region that are part of molecules with atoms inside the region will not be in the group. Using the group command a second time with include molecule will add those atoms that are outside the region to the group.

Note: The include molecule operation is relatively expensive in a parallel sense. This is because it requires com-
munication of relevant molecule IDs between all the processors and each processor to loop over its atoms once per processor, to compare its atoms to the list of molecule IDs from every other processor. Hence it scales as N, rather than N/P as most of the group operations do, where N is the number of atoms, and P is the number of processors.

The subtract style takes a list of two or more existing group names as arguments. All atoms that belong to the first group, but not to any of the other groups are added to the specified group.

The union style takes a list of one or more existing group names as arguments. All atoms that belong to any of the listed groups are added to the specified group.

The intersect style takes a list of two or more existing group names as arguments. Atoms that belong to every one of the listed groups are added to the specified group.

The dynamic style flags an existing or new group as dynamic. This means atoms will be (re)assigned to the group periodically as a simulation runs. This is in contrast to static groups where atoms are permanently assigned to the group. The way the assignment occurs is as follows. Only atoms in the group specified as the parent group via the parent-ID are assigned to the dynamic group before the following conditions are applied. If the region keyword is used, atoms not in the specified region are removed from the dynamic group. If the var keyword is used, the variable name must be an atom-style or atomfile-style variable. The variable is evaluated and atoms whose per-atom values are 0.0, are removed from the dynamic group. If the property keyword is used, the per-atom property name must be a previously defined per-atom property. The per-atom property is evaluated and atoms whose values are 0.0 are removed from the dynamic group.

The assignment of atoms to a dynamic group is done at the beginning of each run and on every timestep that is a multiple of N, which is the argument for the every keyword (N = 1 is the default). For an energy minimization, via the minimize command, an assignment is made at the beginning of the minimization, but not during the iterations of the minimizer.

The point in the timestep at which atoms are assigned to a dynamic group is after the initial stage of velocity Verlet time integration has been performed, and before neighbor lists or forces are computed. This is the point in the timestep where atom positions have just changed due to the time integration, so the region criterion should be accurate, if applied.

Note: If the region keyword is used to determine what atoms are in the dynamic group, atoms can move outside of the simulation box between reneighboring events. Thus if you want to include all atoms on the left side of the simulation box, you probably want to set the left boundary of the region to be outside the simulation box by some reasonable amount (e.g. up to the cutoff of the potential), else they may be excluded from the dynamic region.

Here is an example of using a dynamic group to shrink the set of atoms being integrated by using a spherical region with a variable radius (shrinking from 18 to 5 over the course of the run). This could be used to model a quench of
the system, freezing atoms outside the shrinking sphere, then converting the remaining atoms to a static group and running further.

```plaintext
variable nsteps equal 5000
variable rad equal 18-(step/v_nsteps) *(18-5)
region ss sphere 20 20 0 v_rad
group mobile dynamic all region ss
fix 1 mobile nve
run ${nsteps}
group mobile static
run ${nsteps}
```

**Note:** All fixes and computes take a group ID as an argument, but they do not all allow for use of a dynamic group. If you get an error message that this is not allowed, but feel that it should be for the fix or compute in question, then please post your reasoning to the LAMMPS mail list and we can change it.

The *static* style removes the setting for a dynamic group, converting it to a static group (the default). The atoms in the static group are those currently in the dynamic group.

### 17.51.4 Restrictions

There can be no more than 32 groups defined at one time, including “all”.

The parent group of a dynamic group cannot itself be a dynamic group.

### 17.51.5 Related commands

*dump*, *fix*, *region*, *velocity*

### 17.51.6 Default

All atoms belong to the “all” group.

### 17.52 group2ndx command

### 17.53 ndx2group command

#### 17.53.1 Syntax

```plaintext
group2ndx file group-ID ...
ndx2group file group-ID ...
```

- file = name of index file to write out or read in
- zero or more group IDs may be appended

17.53.3 Description

Write or read a Gromacs style index file in text format that associates atom IDs with the corresponding group definitions. This index file can be used with in combination with Gromacs analysis tools or to import group definitions into the fix colvars input file. It can also be used to save and restore group definitions for static groups.

The `group2ndx` command will write group definitions to an index file. Without specifying any group IDs, all groups will be written to the index file. When specifying group IDs, only those groups will be written to the index file. In order to follow the Gromacs conventions, the group `all` will be renamed to `System` in the index file.

The `ndx2group` command will create or update group definitions from those stored in an index file. Without specifying any group IDs, all groups except `System` will be read from the index file and the corresponding groups recreated. If a group of the same name already exists, it will be completely reset. When specifying group IDs, those groups, if present, will be read from the index file and restored.

17.53.4 Restrictions

This command requires that atoms have atom IDs, since this is the information that is written to the index file.

These commands are part of the USER-COLVARS package. They are only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

17.53.5 Related commands

`group`, `dump`, `fix colvars`

17.54 hyper command

17.54.1 Syntax

```
hyper N Nevent fix-ID compute-ID keyword values ...
```

- N = # of timesteps to run
- Nevent = check for events every this many steps
- fix-ID = ID of a fix that applies a global or local bias potential, can be NULL
• compute-ID = ID of a compute that identifies when an event has occurred
• zero or more keyword/value pairs may be appended
• keyword = min or dump or rebond
  
  \textit{min} values = \textit{etol} \textit{ftol} \textit{maxiter} \textit{maxeval}  
  \textit{etol} = stopping tolerance for energy, used in quenching  
  \textit{ftol} = stopping tolerance for force, used in quenching  
  \textit{maxiter} = max iterations of minimize, used in quenching  
  \textit{maxeval} = max number of force/energy evaluations, used in quenching  

  \textit{dump} value = \textit{dump-ID}  
  \textit{dump-ID} = ID of dump to trigger whenever an event takes place  

  \textit{rebond} value = \textit{Nrebond}  
  \textit{Nrebond} = frequency at which to reset bonds, even if no event has occurred  

17.54.2 Examples

\begin{verbatim}
compute event all event/displace 1.0
fix HG mobile hyper/global 3.0 0.3 0.4 800.0
hyper 5000 100 HG event min 1.0e-6 1.0e-6 100 100 dump 1 dump 5
\end{verbatim}

17.54.3 Description

Run a bond-boost hyperdynamics (HD) simulation where time is accelerated by application of a bias potential to one or more pairs of nearby atoms in the system. This command can be used to run both global and local hyperdynamics. In global HD a single bond within the system is biased on each timestep. In local HD multiple bonds (separated by a sufficient distance) can be biased simultaneously at each timestep. In the bond-boost hyperdynamics context, a “bond” is not a covalent bond between a pair of atoms in a molecule. Rather it is simply a pair of nearby atoms as discussed below.

Both global and local HD are described in (Voter2013) by Art Voter and collaborators. Similar to parallel replica dynamics (PRD), global and local HD are methods for performing accelerated dynamics that are suitable for infrequent-event systems that obey first-order kinetics. A good overview of accelerated dynamics methods (AMD) for such systems in given in (Voter2002) from the same group. To quote from the review paper: “The dynamical evolution is characterized by vibrational excursions within a potential basin, punctuated by occasional transitions between basins. The transition probability is characterized by \( p(t) = k\exp(-kt) \) where \( k \) is the rate constant.”

Both HD and PRD produce a time-accurate trajectory that effectively extends the timescale over which a system can be simulated, but they do it differently. HD uses a single replica of the system and accelerates time by biasing the interaction potential in a manner such that each timestep is effectively longer. PRD creates \( N_r \) replicas of the system and runs dynamics on each independently with a normal unbiased potential until an event occurs in one of the replicas. The time between events is reduced by a factor of \( N_r \) replicas. For both methods, per CPU second, more physical time elapses and more events occur. See the \textit{prd} doc page for more info about PRD.

An HD run has several stages, which are repeated each time an event occurs, as explained below. The logic for an HD run is as follows:

\begin{verbatim}
  quench  
  create initial list of bonds  
  
  while (time remains):  
    run dynamics for \textit{Nevent} steps  
    quench
\end{verbatim}

(continues on next page)
check for an event
if event occurred: reset list of bonds
restore pre-quench state

The list of bonds is the list of atom pairs of atoms that are within a short cutoff distance of each other after the system energy is minimized (quenched). This list is created and reset by a fix hyper/global or fix hyper/local command specified as fix-ID. At every dynamics timestep, the same fix selects one of more bonds to apply a bias potential to.

Note: The style of fix associated with the specified fix-ID determines whether you are running the global versus local hyperdynamics algorithm.

Dynamics (with the bias potential) is run continuously, stopping every Nevent steps to check if a transition event has occurred. The specified N for total steps must be a multiple of Nevent. check is performed by quenching the system and comparing the resulting atom coordinates to the coordinates from the previous basin.

A quench is an energy minimization and is performed by whichever algorithm has been defined by the min_style command. Minimization parameters may be set via the min_modify command and by the min keyword of the hyper command. The latter are the settings that would be used with the minimize command. Note that typically, you do not need to perform a highly-converged minimization to detect a transition event, though you may need to in order to prevent a set of atoms in the system from relaxing to a saddle point.

The event check is performed by a compute with the specified compute-ID. Currently there is only one compute that works with the hyper command, which is the compute event/displace command. Other event-checking computes may be added. Compute event/displace checks whether any atom in the compute group has moved further than a specified threshold distance. If so, an event has occurred.

If this happens, the list of bonds is reset, since some bond pairs are likely now too far apart, and new pairs are likely close enough to be considered a bond. The pre-quenched state of the system (coordinates and velocities) is restored, and dynamics continue.

At the end of the hyper run, a variety of statistics are output to the screen and logfile. These include info relevant to both global and local hyperdynamics, such as the number of events and the elapsed hyper time (accelerated time). And it includes info specific to one or the other, depending on which style of fix was specified by fix-ID.

The optional keywords operate as follows.

As explained above, the min keyword can be used to specify parameters for the quench. Their meaning is the same as for the minimize command

The dump keyword can be used to trigger a specific dump command with the specified dump-ID to output a snapshot each time an event is detected. It can be specified multiple times with different dump-ID values, as in the example above. These snapshots will be for the quenched state of the system on a timestep that is a multiple of Nevent, i.e. a timestep after the event has occurred. Note that any dump command in the input script will also output snapshots at whatever timestep interval it defines via its N argument; see the dump command for details. This means if you only want a particular dump to output snapshots when events are detected, you should specify its N as a value larger than the length of the hyperdynamics run.

As in the code logic above, the bond list is normally only reset when an event occurs. The rebond keyword will force a reset of the bond list every Nrebond steps, even if an event has not occurred. Nrebond must be a multiple of Nevent. This can be useful to check if more frequent resets alter event statistics, perhaps because the parameters chosen for defining what is a bond and what is an event are producing bad dynamics in the presence of the bias potential.
17.54.4 Restrictions

This command can only be used if LAMMPS was built with the REPLICA package. See the Build package doc page for more info.

The option defaults are min = 0.1 0.1 40 50 and time = steps.

17.55 if command

17.55.1 Syntax

if boolean then t1 t2 ... elif boolean f1 f2 ... elif boolean f1 f2 ... else e1 e2 ...

- boolean = a Boolean expression evaluated as TRUE or FALSE (see below)
- then = required word
- t1,t2,...,tN = one or more LAMMPS commands to execute if condition is met, each enclosed in quotes
- elif = optional word, can appear multiple times
- f1,f2,...,fN = one or more LAMMPS commands to execute if elif condition is met, each enclosed in quotes (optional arguments)
- else = optional argument
- e1,e2,...,eN = one or more LAMMPS commands to execute if no condition is met, each enclosed in quotes (optional arguments)

17.55.2 Examples

if "${steps} > 1000" then quit
if "${myString} == a10" then quit
if "$x <= $y" then "print X is smaller = $x" else "print Y is smaller = $y"
if "(${eng} > 0.0) || ($n < 1000)" then &
  "timestep 0.005" &
elif $n<10000 &
  "timestep 0.01" &
else &
  "timestep 0.02" &
  "print 'Max step reached'"
if "${eng} > ${eng_previous}" then "jump file1" else "jump file2"
17.55.3 Description

This command provides an if-then-else capability within an input script. A Boolean expression is evaluated and the result is TRUE or FALSE. Note that as in the examples above, the expression can contain variables, as defined by the variable command, which will be evaluated as part of the expression. Thus a user-defined formula that reflects the current state of the simulation can be used to issue one or more new commands.

If the result of the Boolean expression is TRUE, then one or more commands (t1, t2, ..., tN) are executed. If it is FALSE, then Boolean expressions associated with successive elif keywords are evaluated until one is found to be true, in which case its commands (f1, f2, ..., fN) are executed. If no Boolean expression is TRUE, then the commands associated with the else keyword, namely (e1, e2, ..., eN), are executed. The elif and else keywords and their associated commands are optional. If they are not specified and the initial Boolean expression is FALSE, then no commands are executed.

The syntax for Boolean expressions is described below.

Each command (t1, f1, e1, etc) can be any valid LAMMPS input script command. If the command is more than one word, it must be enclosed in quotes, so it will be treated as a single argument, as in the examples above.

Note: If a command itself requires a quoted argument (e.g. a print command), then double and single quotes can be used and nested in the usual manner, as in the examples above and below. The Commands parse doc page has more details on using quotes in arguments. Only one level of nesting is allowed, but that should be sufficient for most use cases.

Note that by using the line continuation character “&”, the if command can be spread across many lines, though it is still a single command:

```lmp
if "$a < $b" then &
   "print 'Minimum value = $a'" &
   "run 1000" &
else &
   'print "Minimum value = $b"' &
   "minimize 0.001 0.001 1000 10000"
```

Note that if one of the commands to execute is quit, as in the first example above, then executing the command will cause LAMMPS to halt.

Note that by jumping to a label in the same input script, the if command can be used to break out of a loop. See the variable delete command for info on how to delete the associated loop variable, so that it can be re-used later in the input script.

Here is an example of a loop which checks every 1000 steps if the system temperature has reached a certain value, and if so, breaks out of the loop to finish the run. Note that any variable could be checked, so long as it is current on the timestep when the run completes. As explained on the variable doc page, this can be insured by including the variable in thermodynamic output.

```lmp
variable myTemp equal temp
label loop
variable a loop 1000
run 1000
if "${myTemp} < 300.0" then "jump SELF break"
next a
jump SELF loop
label break
print "ALL DONE"
```
Here is an example of a double loop which uses the if and jump commands to break out of the inner loop when a condition is met, then continues iterating through the outer loop.

```
label loopa
variable a loop 5
label loopb
variable b loop 5
print "A,B = $a,$b"
run 10000
if "$b > 2" then "jump SELF break"
next b
jump in.script loopb
label break
variable b delete
next a
jump SELF loopa
```

The Boolean expressions for the if and elif keywords have a C-like syntax. Note that each expression is a single argument within the if command. Thus if you want to include spaces in the expression for clarity, you must enclose the entire expression in quotes.

An expression is built out of numbers (which start with a digit or period or minus sign) or strings (which start with a letter and can contain alphanumeric characters or underscores):

```
0.2, 100, 1.0e20, -15.4, etc
InP, myString, a123, ab_23_cd, etc
```

and Boolean operators:

```
```

Each A and B is a number or string or a variable reference like $a or ${abc}, or A or B can be another Boolean expression.

If a variable is used it can produce a number when evaluated, like an equal-style variable. Or it can produce a string, like an index-style variable. For an individual Boolean operator, A and B must both be numbers or must both be strings. You cannot compare a number to a string.

Expressions are evaluated left to right and have the usual C-style precedence: the unary logical NOT operator “!” has the highest precedence, the 4 relational operators “<”, “<=”, “>”, and “>=” are next; the two remaining relational operators “==” and “!=” are next; then the logical AND operator “&&”; and finally the logical OR operator “||” and logical XOR (exclusive or) operator “^” have the lowest precedence. Parenthesis can be used to group one or more portions of an expression and/or enforce a different order of evaluation than what would occur with the default precedence.

When the 6 relational operators (first 6 in list above) compare 2 numbers, they return either a 1.0 or 0.0 depending on whether the relationship between A and B is TRUE or FALSE. When the 6 relational operators compare 2 strings, they also return a 1.0 or 0.0 for TRUE or FALSE, but the comparison is done by the C function strcmp().

When the 3 logical operators (last 3 in list above) compare 2 numbers, they also return either a 1.0 or 0.0 depending on whether the relationship between A and B is TRUE or FALSE (or just A). The logical AND operator will return 1.0 if both its arguments are non-zero, else it returns 0.0. The logical OR operator will return 1.0 if either of its arguments is non-zero, else it returns 0.0. The logical XOR operator will return 1.0 if one of its arguments is zero and the other non-zero, else it returns 0.0. The logical NOT operator returns 1.0 if its argument is 0.0, else it returns 0.0. The 3 logical operators can only be used to operate on numbers, not on strings.

The overall Boolean expression produces a TRUE result if the result is non-zero. If the result is zero, the expression result is FALSE.
17.55.4 Restrictions

none

17.55.5 Related commands

variable, print

17.55.6 Default

none

17.56 improper_coeff command

17.56.1 Syntax

improper_coeff N args

- N = improper type (see asterisk form below)
- args = coefficients for one or more improper types

17.56.2 Examples

improper_coeff 1 300.0 0.0
improper_coeff * 80.2 -1 2
improper_coeff *4 80.2 -1 2

17.56.3 Description

Specify the improper force field coefficients for one or more improper types. The number and meaning of the coefficients depends on the improper style. Improper coefficients can also be set in the data file read by the read_data command or in a restart file.

N can be specified in one of two ways. An explicit numeric value can be used, as in the first example above. Or a wild-card asterisk can be used to set the coefficients for multiple improper types. This takes the form “*” or “*n” or “n*” or “m*n”. If N = the number of improper types, then an asterisk with no numeric values means all types from 1 to N. A leading asterisk means all types from 1 to n (inclusive). A trailing asterisk means all types from n to N (inclusive). A middle asterisk means all types from m to n (inclusive).

Note that using an improper_coeff command can override a previous setting for the same improper type. For example, these commands set the coeffs for all improper types, then overwrite the coeffs for just improper type 2:

improper_coeff * 300.0 0.0
improper_coeff 2 50.0 0.0
A line in a data file that specifies improper coefficients uses the exact same format as the arguments of the improper_coeff command in an input script, except that wild-card asterisks should not be used since coefficients for all N types must be listed in the file. For example, under the “Improper Coeffs” section of a data file, the line that corresponds to the first example above would be listed as

```
1 300.0 0.0
```

The improper_style class2 is an exception to this rule, in that an additional argument is used in the input script to allow specification of the cross-term coefficients. See its doc page for details.

The list of all improper styles defined in LAMMPS is given on the improper_style doc page. They are also listed in more compact form on the Commands improper doc page. On either of those pages, click on the style to display the formula it computes and its coefficients as specified by the associated improper_coeff command.

17.56.4 Restrictions

This command must come after the simulation box is defined by a read_data, read_restart, or create_box command. An improper style must be defined before any improper coefficients are set, either in the input script or in a data file.

17.56.5 Related commands

improper_style

17.56.6 Default

17.57 improper_style command

17.57.1 Syntax

```
improper_style style
```

- style = none or hybrid or class2 or cvff or harmonic

17.57.2 Examples

```
improper_style harmonic
improper_style cvff
improper_style hybrid cvff harmonic
```
17.57.3 Description

Set the formula(s) LAMMPS uses to compute improper interactions between quadruplets of atoms, which remain in force for the duration of the simulation. The list of improper quadruplets is read in by a `read_data` or `read_restart` command from a data or restart file. Note that the ordering of the 4 atoms in an improper quadruplet determines the definition of the improper angle used in the formula for each style. See the doc pages of individual styles for details.

Hybrid models where impropers are computed using different improper potentials can be setup using the `hybrid` improper style.

The coefficients associated with an improper style can be specified in a data or restart file or via the `improper_coeff` command.

All improper potentials store their coefficient data in binary restart files which means improper_style and `improper_coeff` commands do not need to be re-specified in an input script that restarts a simulation. See the `read_restart` command for details on how to do this. The one exception is that improper_style `hybrid` only stores the list of sub-styles in the restart file; improper coefficients need to be re-specified.

**Note:** When both an improper and pair style is defined, the `special_bonds` command often needs to be used to turn off (or weight) the pairwise interaction that would otherwise exist between a group of 4 bonded atoms.

Here is an alphabetic list of improper styles defined in LAMMPS. Click on the style to display the formula it computes and coefficients specified by the associated `improper_coeff` command.

Click on the style to display the formula it computes, any additional arguments specified in the improper_style command, and coefficients specified by the associated `improper_coeff` command.

There are also additional accelerated pair styles included in the LAMMPS distribution for faster performance on CPUs, GPUs, and KNLs. The individual style names on the `Commands improper` doc page are followed by one or more of (g,i,k,o,t) to indicate which accelerated styles exist.

- **none** - turn off improper interactions
- **zero** - topology but no interactions
- **hybrid** - define multiple styles of improper interactions
- **class2** - COMPASS (class 2) improper
- **cossq** - improper with a cosine squared term
- **cvff** - CVFF improper
- **distance** - improper based on distance between atom planes
- **distharm** - improper that is harmonic in the out-of-plane distance
- **fourier** - improper with multiple cosine terms
- **harmonic** - harmonic improper
- **inversion/harmonic** - harmonic improper with Wilson-Decius out-of-plane definition
- **ring** - improper which prevents planar conformations
- **umbrella** - DREIDING improper
- **sqdistharm** - improper that is harmonic in the square of the out-of-plane distance
17.57.4 Restrictions

Improper styles can only be set for atom_style choices that allow impropers to be defined.
Most improper styles are part of the MOLECULE package. They are only enabled if LAMMPS was built with that package. See the Build package doc page for more info. The doc pages for individual improper potentials tell if it is part of a package.

improper_style none

17.58 include command

17.58.1 Syntax

include file

- file = filename of new input script to switch to

17.58.2 Examples

include newfile
include in.run2

17.58.3 Description

This command opens a new input script file and begins reading LAMMPS commands from that file. When the new file is finished, the original file is returned to. Include files can be nested as deeply as desired. If input script A includes script B, and B includes A, then LAMMPS could run for a long time.
If the filename is a variable (see the variable command), different processor partitions can run different input scripts.

17.59 info command

17.59.1 Syntax

```
info args
```

- `args` = one or more of the following keywords: `out`, `all`, `system`, `memory`, `communication`, `computes`, `dumps`, `fixes`, `groups`, `regions`, `variables`, `coeffs`, `styles`, `time`, or `configuration`
- `out` values = `screen`, `log`, `append` `filename`, `overwrite` `filename`
- `styles` values = `all`, `angle`, `atom`, `bond`, `compute`, `command`, `dump`, `dihedral`, `fix`, `improper`, `integrate`, `kspace`, `minimize`, `pair`, `region`

17.59.2 Examples

```
info system
info groups computes variables
info all out log
info all out append info.txt
info styles all
info styles atom
```

17.59.3 Description

Print out information about the current internal state of the running LAMMPS process. This can be helpful when debugging or validating complex input scripts. Several output categories are available and one or more output category may be requested.

The `out` flag controls where the output is sent. It can only be sent to one target. By default this is the screen, if it is active. The `log` argument selects the log file instead. With the `append` and `overwrite` option, followed by a filename, the output is written to that file, which is either appended to or overwritten, respectively.

The `all` flag activates printing all categories listed below.

The `configuration` category prints some information about the LAMMPS version as well as architecture and OS it is run on.

The `memory` category prints some information about the current memory allocation of MPI rank 0 (this the amount of dynamically allocated memory reported by LAMMPS classes). Where supported, also some OS specific information about the size of the reserved memory pool size (this is where malloc() and the new operator request memory from) and the maximum resident set size is reported (this is the maximum amount of physical memory occupied so far).
The **system** category prints a general system overview listing. This includes the unit style, atom style, number of atoms, bonds, angles, dihedrals, and impropers and the number of the respective types, box dimensions and properties, force computing styles and more.

The **communication** category prints a variety of information about communication and parallelization: the MPI library version level, the number of MPI ranks and OpenMP threads, the communication style and layout, the processor grid dimensions, ghost atom communication mode, cutoff, and related settings.

The **computes** category prints a list of all currently defined computes, their IDs and styles and groups they operate on.

The **dumps** category prints a list of all currently active dumps, their IDs, styles, filenames, groups, and dump frequencies.

The **fixes** category prints a list of all currently defined fixes, their IDs and styles and groups they operate on.

The **groups** category prints a list of all currently defined groups.

The **regions** category prints a list of all currently defined regions, their IDs and styles and whether “inside” or “outside” atoms are selected.

The **variables** category prints a list of all currently defined variables, their names, styles, definition and last computed value, if available.

The **coeffs** category prints a list for each defined force style (pair, bond, angle, dihedral, improper) indicating which of the corresponding coefficients have been set. This can be very helpful to debug error messages like “All pair coeffs are not set”.

The **styles** category prints the list of styles available in the current LAMMPS binary. It supports one of the following options to control which category of styles is printed out:

- all
- angle
- atom
- bond
- compute
- command
- dump
- dihedral
- fix
- improper
- integrate
- kspace
- minimize
- pair
- region

The **time** category prints the accumulated CPU and wall time for the process that writes output (usually MPI rank 0).
17.59.4 Restrictions

none

17.59.5 Related commands

print

17.59.6 Default

The out option has the default screen.
The styles option has the default all.

17.60 jump command

17.60.1 Syntax

jump file label

• file = filename of new input script to switch to
• label = optional label within file to jump to

17.60.2 Examples

jump newfile
jump in.run2 runloop
jump SELF runloop

17.60.3 Description

This command closes the current input script file, opens the file with the specified name, and begins reading LAMMPS commands from that file. Unlike the include command, the original file is not returned to, although by using multiple jump commands it is possible to chain from file to file or back to the original file.

If the word “SELF” is used for the filename, then the current input script is re-opened and read again.

Note: The SELF option is not guaranteed to work when the current input script is being read through stdin (standard input), e.g.

```
imap_g++ < in.script
```

since the SELF option invokes the C-library rewind() call, which may not be supported for stdin on some systems or by some MPI implementations. This can be worked around by using the -in command-line switch, e.g.

```
imap_g++ -in in.script
```
or by using the \texttt{-var command-line switch} to pass the script name as a variable to the input script. In the latter case, a \texttt{variable} called “fname” could be used in place of \texttt{SELF}, e.g.

\begin{verbatim}
lmp_g++ -var fname in.script < in.script
\end{verbatim}

The second argument to the \texttt{jump} command is optional. If specified, it is treated as a label and the new file is scanned (without executing commands) until the label is found, and commands are executed from that point forward. This can be used to loop over a portion of the input script, as in this example. These commands perform 10 runs, each of 10000 steps, and create 10 dump files named file.1, file.2, etc. The \texttt{next} command is used to exit the loop after 10 iterations. When the “a” variable has been incremented for the tenth time, it will cause the next \texttt{jump} command to be skipped.

\begin{verbatim}
variable a loop 10
label loop
dump 1 all atom 100 file.$a
run 10000
undump 1
next a
jump in.lj loop
\end{verbatim}

If the \texttt{jump file} argument is a variable, the \texttt{jump} command can be used to cause different processor partitions to run different input scripts. In this example, LAMMPS is run on 40 processors, with 4 partitions of 10 procs each. An \texttt{in.file} containing the example variable and \texttt{jump} command will cause each partition to run a different simulation.

\begin{verbatim}
mpirun -np 40 lmp.ibm -partition 4x10 -in in.file
variable f world script.1 script.2 script.3 script.4
jump $f
\end{verbatim}

Here is an example of a loop which checks every 1000 steps if the system temperature has reached a certain value, and if so, breaks out of the loop to finish the run. Note that any variable could be checked, so long as it is current on the timestep when the run completes. As explained on the \texttt{variable doc} page, this can be insured by including the variable in thermodynamic output.

\begin{verbatim}
variable myTemp equal temp
label loop
variable a loop 1000
run 1000
if "${myTemp} < 300.0" then "jump SELF break"
next a
jump SELF loop
label break
print "ALL DONE"
\end{verbatim}

Here is an example of a double loop which uses the \texttt{if} and \texttt{jump} commands to break out of the inner loop when a condition is met, then continues iterating through the outer loop.

\begin{verbatim}
label loopa
variable a loop 5
label loopb
variable b loop 5
print "A,B = $a,$b"
run 10000
if "$b > 2" then "jump SELF break"
next b
jump in.script loopb
label break
variable b delete
\end{verbatim}

(continues on next page)
### 17.60.4 Restrictions

If you jump to a file and it does not contain the specified label, LAMMPS will come to the end of the file and exit.

### 17.60.5 Related commands

kim_property modify instance_id key key_name key_name_key key_name_value
kim_property remove instance_id key key_name
kim_property destroy instance_id
kim_property dump file
```

- `model` = name of the KIM interatomic model (the KIM ID for models archived in OpenKIM)
- `user_units` = the LAMMPS `units` style assumed in the LAMMPS input script
- `unitarg` = `unit_conversion_mode` (optional)
- `typeargs` = atom type to species mapping (one entry per atom type) or `fixed_types` for models with a preset fixed mapping
• variable(s) = single name or list of names of (string style) LAMMPS variable(s) where a query result or parame-
eter get result is stored. Variables that do not exist will be created by the command.

• formatarg = list, split, or explicit (optional):
  
  list = returns a single string with a list of space separated values (e.g. "1.0 2.0 3.0"), which is placed in a LAMMPS variable as defined by the variable argument. [default for kim_query]
  
  split = returns the values separately in new variables with names based on the prefix specified in variable and a number appended to indicate which element in the list of values is in the variable.
  
  explicit = returns the values separately in one more more variable names provided as arguments that precede formatarg. [default for kim_param]

• query_function = name of the OpenKIM web API query function to be used

• queryargs = a series of keyword=value pairs that represent the web query; supported keywords depend on the query function

• param_name = name of a KIM portable model parameter

• index_range = KIM portable model parameter index range (an integer for a single element, or pair of integers separated by a colon for a range of elements)

• values = new value(s) to replace the current value(s) of a KIM portable model parameter

• instance_id = a positive integer identifying the KIM property instance

• property_id = identifier of a KIM Property Definition, which can be (1) a property short name, (2) the full unique ID of the property (including the contributor and date), (3) a file name corresponding to a local property definition file

• key_name = one of the keys belonging to the specified KIM property definition

• key_name_key = a key belonging to a key-value pair (standardized in the KIM Properties Framework)

• key_name_value = value to be associated with a key_name_key in a key-value pair

• file = name of a file to write the currently defined set of KIM property instances to

17.65.3 Description

The set of *kim_commands* provide a high-level wrapper around the Open Knowledgebase of Interatomic Models (OpenKIM) repository of interatomic models (IMs) (potentials and force fields), so that they can be used by LAMMPS scripts. These commands do not implement any computations directly, but rather generate LAMMPS input commands based on the information retrieved from the OpenKIM repository to initialize and activate OpenKIM IMs and query their predictions for use in the LAMMPS script. All LAMMPS input commands generated and executed by *kim_commands* are echoed to the LAMMPS log file.

Benefits of Using OpenKIM IMs

Employing OpenKIM IMs provides LAMMPS users with multiple benefits:

Reliability

- All content archived in OpenKIM is reviewed by the KIM Editor for quality.
- IMs in OpenKIM are archived with full provenance control. Each is associated with a maintainer responsible for the integrity of the content. All changes are tracked and recorded.
- IMs in OpenKIM are exhaustively tested using KIM Tests that compute a host of material properties, and KIM Verification Checks that provide the user with information on various aspects of the IM behavior and coding correctness. This information is displayed on the IM’s page accessible through the OpenKIM browse interface.

Reproducibility

- Each IM in OpenKIM is issued a unique identifier (KIM ID), which includes a version number (last three digits). Any changes that can result in different numerical values lead to a version increment in the KIM ID. This makes it possible to reproduce simulations since the specific version of a specific IM used can be retrieved using its KIM ID.
- OpenKIM is a member organization of DataCite and issues digital object identifiers (DOIs) to all IMs archived in OpenKIM. This makes it possible to cite the IM code used in a simulation in a publications to give credit to the developers and further facilitate reproducibility.

Convenience

- IMs in OpenKIM are distributed in binary form along with LAMMPS and can be used in a LAMMPS input script simply by providing their KIM ID in the *kim_init* command documented on this page.
- The *kim_query* web query tool provides the ability to use the predictions of IMs for supported material properties (computed via KIM Tests) as part of a LAMMPS input script setup and analysis.
- Support is provided for unit conversion between the *unit style* used in the LAMMPS input script and the units required by the OpenKIM IM. This makes it possible to use a single input script with IMs using different units without change and minimizes the likelihood of errors due to incompatible units.
Types of IMs in OpenKIM

There are two types of IMs archived in OpenKIM:

1. The first type is called a *KIM Portable Model* (PM). A KIM PM is an independent computer implementation of an IM written in one of the languages supported by KIM (C, C++, Fortran) that conforms to the KIM Application Programming Interface (KIM API) Portable Model Interface (PMI) standard. A KIM PM will work seamlessly with any simulation code that supports the KIM API/PMI standard (including LAMMPS; see complete list of supported codes).

2. The second type is called a *KIM Simulator Model* (SM). A KIM SM is an IM that is implemented natively within a simulation code (*simulator*) that supports the KIM API Simulator Model Interface (SMI); in this case LAMMPS. A separate SM package is archived in OpenKIM for each parameterization of the IM, which includes all of the necessary parameter files, LAMMPS commands, and metadata (supported species, units, etc.) needed to run the IM in LAMMPS.

With these two IM types, OpenKIM can archive and test almost all IMs that can be used by LAMMPS. (It is easy to contribute new IMs to OpenKIM, see the upload instructions.)

OpenKIM IMs are uniquely identified by a *KIM ID*. The extended KIM ID consists of a human-readable prefix identifying the type of IM, authors, publication year, and supported species, separated by two underscores from the KIM ID itself, which begins with an IM code (*MO* for a KIM Portable Model, and *SM* for a KIM Simulator Model) followed by a unique 12-digit code and a 3-digit version identifier. By convention SM prefixes begin with *Sim_* to readily identify them.

| SW_Stillinge Weber_1985_Si__MO_405512056662_005 |
| Sim_LAMMPS_ReaxFF_StrachanVanDuinChakraborty_2003_CHNO_SM_107643900657_000 |

Each OpenKIM IM has a dedicated “Model Page” on OpenKIM providing all the information on the IM including a title, description, authorship and citation information, test and verification check results, visualizations of results, a wiki with documentation and user comments, and access to raw files, and other information. The URL for the Model Page is constructed from the extended KIM ID of the IM:

https://openkim.org/id/extended_KIM_ID

For example, for the Stillinger–Weber potential listed above the Model Page is located at:

https://openkim.org/id/SW_Stillinge Weber_1985_Si__MO_405512056662_005

See the current list of KIM PMs and SMs archived in OpenKIM. This list is sorted by species and can be filtered to display only IMs for certain species combinations.

See Obtaining KIM Models to learn how to install a pre-built binary of the OpenKIM Repository of Models.

**Note:** It is also possible to locally install IMs not archived in OpenKIM, in which case their names do not have to conform to the KIM ID format.
Using OpenKIM IMs with LAMMPS

Two commands are employed when using OpenKIM IMs, one to select the IM and perform necessary initialization (kim_init), and the second to set up the IM for use by executing any necessary LAMMPS commands (kim_interactions). Both are required.

See the examples/kim directory for example input scripts that use KIM PMs and KIM SMs.

OpenKIM IM Initialization (kim_init)

The kim_init mode command must be issued before the simulation box is created (normally at the top of the file). This command sets the OpenKIM IM that will be used and may issue additional commands changing LAMMPS default settings that are required for using the selected IM (such as units or atom_style). If needed, those settings can be overridden, however, typically a script containing a kim_init command would not include units and atom_style commands.

The required arguments of kim_init are the model name of the IM to be used in the simulation (for an IM archived in OpenKIM this is its extended KIM ID, and the user_units, which are the LAMMPS units style used in the input script. (Any dimensioned numerical values in the input script and values read in from files are expected to be in the user_units system.)

The selected IM can be either a KIM PM or a KIM SM. For a KIM SM, the kim_init command verifies that the SM is designed to work with LAMMPS (and not another simulation code). In addition, the LAMMPS version used for defining the SM and the LAMMPS version being currently run are printed to help diagnose any incompatible changes to input script or command syntax between the two LAMMPS versions.

Based on the selected model kim_init may modify the atom_style. Some SMs have requirements for this setting. If this is the case, then atom_style will be set to the required style. Otherwise, the value is left unchanged (which in the absence of an atom_style command in the input script is the default atom_style value).

Regarding units, the kim_init command behaves in different ways depending on whether or not unit conversion mode is activated as indicated by the optional unitarg argument. If unit conversion mode is not active, then user_units must either match the required units of the IM or the IM must be able to adjust its units to match. (The latter is only possible with some KIM PMs; SMs can never adjust their units.) If a match is possible, the LAMMPS units command is called to set the units to user_units. If the match fails, the simulation is terminated with an error.

Here is an example of a LAMMPS script to compute the cohesive energy of a face-centered cubic (fcc) lattice for the Ercolessi and Adams (1994) potential for Al:

```
kim_init  EAM_Dynamo_ErcolessiAdams_1994_A1__MO_123629422045_005 metal
boundary  p p p
lattice  fcc 4.032
region  simbox block 0 1 0 1 0 1 units lattice
create_box  1 simbox
create_atoms  1 box
mass  1 26.981539
kim_interactions  Al
run  0
variable  Ec equal (pe/count(all))/${_u_energy}
print  "Cohesive Energy = ${EcJ} eV"
```

The above script will end with an error in the kim_init line if the IM is changed to another potential for Al that does not work with metal units. To address this kim_init offers the unit_conversion_mode as shown below. If unit conversion mode is active, then kim_init calls the LAMMPS units command to set the units to the IM’s required or preferred units. Conversion factors between the IM’s units and the user_units are defined for all physical quantities (mass, distance, etc.). (Note that converting to or from the “lj” unit style is not supported.) These factors are stored as internal style variables with the following standard names:
If desired, the input script can be designed to work with these conversion factors so that the script will work without change with any OpenKIM IM. (This approach is used in the OpenKIM Testing Framework.) For example, the script given above for the cohesive energy of fcc Al can be rewritten to work with any IM regardless of units. The following script constructs an fcc lattice with a lattice parameter defined in meters, computes the total energy, and prints the cohesive energy in Joules regardless of the units of the IM.

```plaintext
kim_init
EAM_Dynamo_ErcolessiAdams_1994_Al__MO_123629422045_005 si unit_
--conversion_mode
boundary p p p
lattice fcc 4.032e-10*$_u_distance$
region simbox block 0 1 0 1 0 1 units lattice
create_box l simbox
create_atoms l box
mass 1 4.480134e-26*$_u_mass$
kim_interactions Al
run 0
variable Ec_in_J equal (pe/count(all))/$_u_energy$
print "Cohesive Energy = ${Ec_in_J} J"
```

Note the multiplication by $_u_distance$ and $_u_mass$ to convert from SI units (specified in the `kim_init` command) to whatever units the IM uses (metal in this case), and the division by $_u_energy$ to convert from the IM’s energy units to SI units (Joule). This script will work correctly for any IM for Al (KIM PM or SM) selected by the `kim_init` command.

Care must be taken to apply unit conversion to dimensional variables read in from a file. For example, if a configuration of atoms is read in from a dump file using the `read_dump` command, the following can be done to convert the box and all atomic positions to the correct units:

```plaintext
variable xyfinal equal xy*$_u_distance$
variable xzfinal equal xz*$_u_distance$
variable yzfinal equal yz*$_u_distance$
change_box all x scale $_u_distance$
  y scale $_u_distance$
  z scale $_u_distance$
  xy final ${xyfinal}$
  xz final ${xzfinal}$
  yz final ${yzfinal}$
remap
```

**Note:** Unit conversion will only work if the conversion factors are placed in all appropriate places in the input script.
OpenKIM IM Execution (*kim_interactions*)

The second and final step in using an OpenKIM IM is to execute the *kim_interactions* command. This command must be preceded by a *kim_init* command and a command that defines the number of atom types $N$ (such as *create_box*). The *kim_interactions* command has one argument *typeargs*. This argument contains either a list of $N$ chemical species, which defines a mapping between atom types in LAMMPS to the available species in the OpenKIM IM, or the keyword *fixed_types* for models that have a preset fixed mapping (i.e. the mapping between LAMMPS atom types and chemical species is defined by the model and cannot be changed). In the latter case, the user must consult the model documentation to see how many atom types there are and how they map to the chemical species.

For example, consider an OpenKIM IM that supports Si and C species. If the LAMMPS simulation has four atom types, where the first three are Si, and the fourth is C, the following *kim_interactions* command would be used:

```
*kim_interactions* Si Si Si C
```

Alternatively, for a model with a fixed mapping the command would be:

```
*kim_interactions* fixed_types
```

The *kim_interactions* command performs all the necessary steps to set up the OpenKIM IM selected in the *kim_init* command. The specific actions depend on whether the IM is a KIM PM or a KIM SM. For a KIM PM, a *pair_style kim* command is executed followed by the appropriate *pair_coeff* command. For example, for the Ercolessi and Adams (1994) KIM PM for Al set by the following commands:

```
*kim_init* EAM_Dynamo_ErcolessiAdams_1994_Al__MO_123629422045_005 metal
...
... box specification lines skipped
...
*kim_interactions* Al
```

the *kim_interactions* command executes the following LAMMPS input commands:

```
*pair_style* kim EAM_Dynamo_ErcolessiAdams_1994_Al__MO_123629422045_005
*pair_coeff* * * Al
```

For a KIM SM, the generated input commands may be more complex and require that LAMMPS is built with the required packages included for the type of potential being used. The set of commands to be executed is defined in the SM specification file, which is part of the SM package. For example, for the Strachan et al. (2003) ReaxFF SM set by the following commands:

```
*kim_init* Sim_LAMMPS_ReaxFF_StrachanVanDuinChakraborty_2003_CHNO__SM_107643900657_000 real
...
... box specification lines skipped
...
*kim_interactions* C H N O
```

the *kim_interactions* command executes the following LAMMPS input commands:

```
*pair_style* reax/c lmp_control safezone 2.0 mincap 100
*pair_coeff* * * ffield.reax.rdx C H N O
*fix* reaxqeq all qeq/reax 1 0.0 10.0 1.0e-6 param.qeq
```
Note: The files \textit{lmp\_control, ffield.reax.rdx} and \textit{param.qeq} are specific to the Strachan et al. (2003) ReaxFF parameterization and are archived as part of the SM package in OpenKIM.

Note: Parameters like cutoff radii and charge tolerances, which have an effect on IM predictions, are also included in the SM definition ensuring reproducibility.

Note: When using \textit{kim\_init} and \textit{kim\_interactions} to select and set up an OpenKIM IM, other LAMMPS commands for the same functions (such as \textit{pair\_style, pair\_coeff, bond\_style, bond\_coeff, fixes related to charge equilibration, etc.}) should normally not appear in the input script.

**Using OpenKIM Web Queries in LAMMPS (kim\_query)**

The \textit{kim\_query} command performs a web query to retrieve the predictions of an IM set by \textit{kim\_init} for material properties archived in OpenKIM.

Note: The \textit{kim\_query} command must be preceded by a \textit{kim\_init} command.

The syntax for the \textit{kim\_query} command is as follows:

```
kim_query variable formatarg query_function queryargs
```

The result of the query is stored in one or more \textit{string style variables} as determined by the optional \textit{formatarg} argument documented above. For the “list” setting of \textit{formatarg} (or if \textit{formatarg} is not specified), the result is returned as a space-separated list of values in \textit{variable}. The \textit{formatarg} keyword “split” separates the result values into individual variables of the form \textit{prefix\_I}, where \textit{prefix} is set to the \textit{kim\_query} variable argument and \textit{I} ranges from 1 to the number of returned values. The number and order of the returned values is determined by the type of query performed. (Note that the “explicit” setting of \textit{formatarg} is not supported by \textit{kim\_query}.)

Note: \textit{kim\_query} only supports queries that return a single result or an array of values. More complex queries that return a JSON structure are not currently supported. An attempt to use \textit{kim\_query} in such cases will generate an error.

The second required argument \textit{query\_function} is the name of the query function to be called (e.g. \textit{get\_lattice\_constant\_cubic}). All following \textit{arguments} are parameters handed over to the web query in the format \textit{keyword=value}, where \textit{value} is always an array of one or more comma-separated items in brackets. The list of supported keywords and the type and format of their values depend on the query function used. The current list of query functions is available on the OpenKIM webpage at https://openkim.org/doc/usage/kim-query.

Note: All query functions require the \textit{model} keyword, which identifies the IM whose predictions are being queried. This keyword is automatically generated by \textit{kim\_query} based on the IM set in \textit{kim\_init} and must not be specified as an argument to \textit{kim\_query}.

Note: Each \textit{query\_function} is associated with a default method (implemented as a KIM Test) used to compute this property. In cases where there are multiple methods in OpenKIM for computing a property, a \textit{method} keyword can be
provided to select the method of choice. See the query documentation to see which methods are available for a given query_function.

**kim_query Usage Examples and Further Clarifications**

The data obtained by *kim_query* commands can be used as part of the setup or analysis phases of LAMMPS simulations. Some examples are given below.

### Define an equilibrium fcc crystal

```plaintext
kim_init     EAM_Dynamo_ErcolessiAdams_1994_Al__MO_123629422045_005 metal
boundary     p p p
kim_query    a0 get_lattice_constant_cubic crystal="fcc" species="Al" units=["angstrom"]
lattice      fcc ${a0}
...
```

The *kim_query* command retrieves from OpenKIM the equilibrium lattice constant predicted by the Ercolessi and Adams (1994) potential for the fcc structure and places it in variable *a0*. This variable is then used on the next line to set up the crystal. By using *kim_query*, the user is saved the trouble and possible error of tracking this value down, or of having to perform an energy minimization to find the equilibrium lattice constant.

**Note:** In unit_conversion_mode the results obtained from a *kim_query* would need to be converted to the appropriate units system. For example, in the above script, the lattice command would need to be changed to: “lattice fcc ${a0}*{\_distance}”.

### Define an equilibrium hcp crystal

```plaintext
kim_init     EAM_Dynamo_Mendelev_2007_Zr__MO_848899341753_000 metal
boundary     p p p
kim_query    latconst split get_lattice_constant_hexagonal crystal="hcp" species="Zr" units="angstrom"
variable     a0 equal latconst_1
variable     c0 equal latconst_2
variable     c_to_a equal ${c0}/${a0}
lattice      custom ${a0} a1 0.5 -0.866025 0 a2 0.5 0.866025 0 a3 0 0 ${c_to_a} &
basis 0.333333 0.666666 0.25 basis 0.666666 0.333333 0.75
...
```

In this case the *kim_query* returns two arguments (since the hexagonal close packed (hcp) structure has two independent lattice constants). The formatarg keyword “split” places the two values into the variables *latconst_1* and *latconst_2*. (These variables are created if they do not already exist.) For convenience the variables *a0* and *c0* are created in order to make the remainder of the input script more readable.

### Define a crystal at finite temperature accounting for thermal expansion

```plaintext
kim_init     EAM_Dynamo_ErcolessiAdams_1994_Al__MO_123629422045_005 metal
boundary     p p p
kim_query    a0 get_lattice_constant_cubic crystal="fcc" species="Al" units=["angstrom"]
kim_query    alpha get_linear_thermal_expansion_coefficient_cubic crystal="fcc" species="Al" units=["1/K"] temperature=[293.15] temperature_units=["K"]
variable     DeltaT equal 300
```

(continues on next page)
As in the previous example, the equilibrium lattice constant is obtained for the Ercolessi and Adams (1994) potential. However, in this case the crystal is scaled to the appropriate lattice constant at room temperature (293.15 K) by using the linear thermal expansion constant predicted by the potential.

Note: When passing numerical values as arguments (as in the case of the temperature in the above example) it is also possible to pass a tolerance indicating how close to the value is considered a match. If no tolerance is passed a default value is used. If multiple results are returned (indicating that the tolerance is too large), *kim_query* will return an error. See the query documentation to see which numerical arguments and tolerances are available for a given *query_function*.

**Compute defect formation energy**

```plaintext
kim_init            EAM_Dynamo_ErcolessiAdams_1994_Al__MO_123629422045_005 metal ...
... Build fcc crystal containing some defect and compute the total energy ...
... which is stored in the variable *Etot*
...
kim_query           Ec get_cohesive_energy_cubic crystal="fcc" species="Al" units=[..."eV"]
variable            Eform equal *Etot* - count(all)*Ec
...
```

The defect formation energy *Eform* is computed by subtracting from *Etot* the ideal fcc cohesive energy of the atoms in the system obtained from OpenKIM for the Ercolessi and Adams (1994) potential.

Note: *kim_query* commands return results archived in OpenKIM. These results are obtained using programs for computing material properties (KIM Tests and KIM Test Drivers) that were contributed to OpenKIM. In order to give credit to Test developers, the number of times results from these programs are queried is tracked. No other information about the nature of the query or its source is recorded.

**Accessing KIM Model Parameters from LAMMPS (*kim_param*)**

All IMs are functional forms containing a set of parameters. The values of these parameters are typically selected to best reproduce a training set of quantum mechanical calculations or available experimental data. For example, a Lennard-Jones potential intended to model argon might have the values of its two parameters, epsilon and sigma, fit to the dimer dissociation energy or thermodynamic properties at a critical point of the phase diagram.

Normally a user employing an IM should not modify its parameters since, as noted above, these are selected to reproduce material properties. However, there are cases where accessing and modifying IM parameters is desired, such as for assessing uncertainty, fitting an IM, or working with an ensemble of IMs. As explained above, IMs archived in OpenKIM are either Portable Models (PMs) or Simulator Models (SMs). KIM PMs are complete independent implementations of an IM, whereas KIM SMs are wrappers to an IM implemented within LAMMPS. Two different mechanisms are provided for accessing IM parameters in these two cases:

- For a KIM PM, the *kim_param* command can be used to get and set the values of the PM’s parameters as explained below.
- For a KIM SM, the user should consult the documentation page for the specific IM and follow instructions there for how to modify its parameters (if possible).
The *kim_param get* and *kim_param set* commands provide an interface to access and change the parameters of a KIM PM that “publishes” its parameters and makes them publicly available (see the KIM API documentation for details).

**Note:** The *kim_param get/set* commands must be preceded by *kim_init*. The *kim_param set* command must additionally be preceded by a *kim_interactions* command (or alternatively by a *pair_style kim* and *pair_coeff* commands). The *kim_param set* command may be used wherever a *pair_coeff* command may occur.

The syntax for the *kim_param* command is as follows:

```
kim_init

kim_param get param_name index_range variable formatarg
kim_param set param_name index_range values
```

Here, *param_name* is the name of a KIM PM parameter (which is published by the PM and available for access). The specific string used to identify a parameter is defined by the PM. For example, for the Stillinger–Weber (SW) potential in OpenKIM, the parameter names are *A*, *B*, *p*, *q*, *sigma*, *gamma*, *cutoff*, *lambda*, *costheta0*.

**Note:** The list of all the parameters that a PM exposes for access/mutation are automatically written to the lammps log file when *kim_init* is called.

Each published parameter of a KIM PM takes the form of an array of numerical values. The array can contain one element for a single-valued parameter, or a set of values. For example, the multispecies SW potential for the Zn-Cd-Hg-S-Se-Te system has the same parameter names as the single-species SW potential, but each parameter array contains 21 entries that correspond to the parameter values used for each pairwise combination of the model’s six supported species (this model does not have parameters specific to individual ternary combinations of its supported species).

The *index_range* argument may either be an integer referring to a specific element within the array associated with the parameter specified by *param_name*, or a pair of integers separated by a colon that refer to a slice of this array. In both cases, one-based indexing is used to refer to the entries of the array.

The result of a *get* operation for a specific *index_range* is stored in one or more LAMMPS string style variables as determined by the optional *formatarg* argument documented above. If not specified, the default for *formatarg* is “explicit” for the *kim_param* command.

For the case where the result is an array with multiple values (i.e. *index_range* contains a range), the optional “split” or “explicit” *formatarg* keywords can be used to separate the results into multiple variables; see the examples below. Multiple parameters can be retrieved with a single call to *kim_param get* by repeating the argument list following *get*.

For a *set* operation, the *values* argument contains the new value(s) for the element(s) of the parameter specified by *index_range*. For the case where multiple values are being set, *values* contains a set of values separated by spaces. Multiple parameters can be set with a single call to *kim_param set* by repeating the argument list following *set*.

**kim_param Usage Examples and Further Clarifications**

Examples of getting and setting KIM PM parameters with further clarifications are provided below.

**Getting a scalar parameter**

```
kim_init

kim_param get A 1 VARA

In this case, the value of the SW *A* parameter is retrieved and placed in the LAMMPS variable VARA. The variable VARA can be used in the remainder of the input script in the same manner as any other LAMMPS variable.

668 Chapter 17. Commands
Getting multiple scalar parameters with a single call

```lambmps
kim_init          SW_StillingerWeber_1985_Si_MO_405512056662_005 metal
                   ...
kim_param         get A 1 VARA B 1 VARB
```

This retrieves the \( A \) and \( B \) parameters of the SW potential and stores them in the LAMMPS variables \( \text{VARA} \) and \( \text{VARB} \).

Getting a range of values from a parameter

There are several options when getting a range of values from a parameter determined by the \texttt{formatarg} argument.

```lambmps
kim_init          SW_ZhouWardMartin_2013_CdTeZnSeHgS_MO_503261197030_002 metal
                   ...
kim_param         get lambda 7: LAM_TeTe LAM_TeZn LAM_TeSe
```

In this case, \texttt{formatarg} is not specified and therefore the default “explicit” mode is used. (The behavior would be the same if the word \texttt{explicit} were added after \( \text{LAM}_{-}\text{TeSe} \).) Elements 7, 8 and 9 of parameter lambda retrieved by the \texttt{get} operation are placed in the LAMMPS variables \( \text{LAM}_{-}\text{TeTe} \), \( \text{LAM}_{-}\text{TeZn} \) and \( \text{LAM}_{-}\text{TeSe} \), respectively.

\textbf{Note:} In the above example, elements 7–9 of the lambda parameter correspond to Te-Te, Te-Zn and Te-Se interactions. This can be determined by visiting the model page for the specified potential and looking at its parameter file linked to at the bottom of the page (file with .param ending) and consulting the README documentation provided with the driver for the PM being used. A link to the driver is provided at the top of the model page.

```lambmps
kim_init          SW_ZhouWardMartin_2013_CdTeZnSeHgS_MO_503261197030_002 metal
                   ...
kim_param         get lambda 15: LAMS list variable LAM_VALUE index \{LAMS\}
                   label loop_on_lambda
                   ...
                   ... do something with current value of lambda
                   ...
                   next LAM_VALUE
                   jump SELF loop_on_lambda
```

In this case, the “list” mode of \texttt{formatarg} is used. The result of the \texttt{get} operation is stored in the LAMMPS variable \( \text{LAMS} \) as a string containing the three retrieved values separated by spaces, e.g “1.0 2.0 3.0”. This can be used in LAMMPS with an \texttt{index} variable to access the values one at a time within a loop as shown in the example. At each iteration of the loop \( \text{LAM}_{-}\text{VALUE} \) contains the current value of lambda.

```lambmps
kim_init          SW_ZhouWardMartin_2013_CdTeZnSeHgS_MO_503261197030_002 metal
                   ...
kim_param         get lambda 15: LAM split
```

In this case, the “split” mode of \texttt{formatarg} is used. The three values retrieved by the \texttt{get} operation are stored in the three LAMMPS variables \( \text{LAM}_{-}15 \), \( \text{LAM}_{-}16 \) and \( \text{LAM}_{-}17 \). The provided name “LAM” is used as prefix and the location in the lambda array is appended to create the variable names.

Setting a scalar parameter

```lambmps
kim_init          SW_StillingerWeber_1985_Si_MO_405512056662_005 metal
                   ...
kim_interactions  Si
kim_param         set gamma 1 2.6
```
Here, the SW potential's gamma parameter is set to 2.6. Note that the get and set commands work together, so that a get following a set operation will return the new value that was set. For example:

```plaintext
...  
kim_interactions  Si
kim_param  get gamma 1 ORIG_GAMMA
kim_param  set gamma 1 2.6
kim_param  get gamma 1 NEW_GAMMA
...  
print  "original gamma = ${ORIG_GAMMA}, new gamma = ${NEW_GAMMA}"  
```

Here, ORIG_GAMMA will contain the original gamma value for the SW potential, while NEW_GAMMA will contain the value 2.6.

Setting multiple scalar parameters with a single call

```plaintext
  
kim_init  SW_ZhouWardMartin_2013_CdTeZnSeHgS_MO_503261197030_002 metal
...  
kim_interactions  Cd Te
variable  VARG equal 2.6
variable  VARS equal 2.0951  
kim_param  set gamma 1 VARG
            set sigma 3 VARS
```

In this case, the first element of the gamma parameter and third element of the sigma parameter are set to 2.6 and 2.0951, respectively. This example also shows how LAMMPS variables can be used when setting parameters.

Setting a range of values of a parameter

```plaintext
  
kim_init  SW_ZhouWardMartin_2013_CdTeZnSeHgS_MO_503261197030_002 metal
...  
kim_interactions  Cd Te Zn Se Hg S
kim_param  set sigma $[5:6] [2.5214 2.23869 2.04516 2.43269 1.80415]
```

In this case, elements 2 through 6 of the parameter sigma are set to the values 2.35214, 2.23869, 2.04516, 2.43269 and 1.80415 in order.

Writing material properties computed in LAMMPS to standard KIM property instance format (kim_property)

As explained above, The OpenKIM system includes a collection of Tests (material property calculation codes), Models (interatomic potentials), Predictions, and Reference Data (DFT or experiments). Specifically, a KIM Test is a computation that when coupled with a KIM Model generates the prediction of that model for a specific material property rigorously defined by a KIM Property Definition (see the KIM Properties Framework for further details). A prediction of a material property for a given model is a specific numerical realization of a property definition, referred to as a “Property Instance.” The objective of the kim_property command is to make it easy to output material properties in a standardized, machine readable, format that can be easily ingested by other programs. Additionally, it aims to make it as easy as possible to convert a LAMMPS script that computes a material property into a KIM Test that can then be uploaded to openkim.org.

A developer interested in creating a KIM Test using a LAMMPS script should first determine whether a property definition that applies to their calculation already exists in OpenKIM by searching the properties page. If none exists, it is possible to use a locally defined property definition contained in a file until it can be uploaded to the official repository (see below). Once one or more applicable property definitions have been identified, the kim_property create, kim_property modify, kim_property remove, and kim_property destroy, commands provide an interface to create, set, modify, remove, and destroy instances of them within a LAMMPS script. Their general syntax is as follows:
Here, `instance_id` is a positive integer used to uniquely identify each property instance; (note that the results file can contain multiple property instances). A `property_id` is an identifier of a KIM Property Definition, which can be (1) a property short name, (2) the full unique ID of the property (including the contributor and date), (3) a file name corresponding to a local property definition file. Examples of each of these cases are shown below:

```
kim_property create 1 atomic-mass
kim_property create 2 cohesive-energy-relation-cubic-crystal
```

```
kim_property create 1 tag@brunelleschoreply.openkim.org,2016-05-11:property/atomic-mass
kim_property create 2 tag@staffchoreply.openkim.org,2014-04-15:property/cohesive-energy-relation-cubic-crystal
```

```
kim_property create 1 new-property.edn
kim_property create 2 /home/mary/marys-kim-properties/dissociation-energy.edn
```

In the last example, “new-property.edn” and “/home/mary/marys-kim-properties/dissociation-energy.edn” are the names of files that contain user-defined (local) property definitions.

A KIM property instance takes the form of a “map,” i.e. a set of key-value pairs akin to Perl’s hash, Python’s dictionary, or Java’s Hashtable. It consists of a set of property key names, each of which is referred to here by the `key_name` argument, that are defined as part of the relevant KIM Property Definition and include only lowercase alphanumeric characters and dashes. The value paired with each property key is itself a map whose possible keys are defined as part of the KIM Properties Framework; these keys are referred to by the `key_name_key` argument and their associated values by the `key_name_value` argument. These values may either be scalars or arrays, as stipulated in the property definition.

**Note:** Each map assigned to a `key_name` must contain the `key_name_key` “source-value” and an associated `key_name_value` of the appropriate type (as defined in the relevant KIM Property Definition). For keys that are defined as having physical units, the “source-unit” `key_name_key` must also be given a string value recognized by GNU units.

Once a `kim_property create` command has been given to instantiate a property instance, maps associated with the property’s keys can be edited using the `kim_property modify` command. In using this command, the special keyword “key” should be given, followed by the property key name and the key-value pair in the map associated with the key that is to be set. For example, the `atomic-mass` property definition consists of two property keys named “mass” and “species.” An instance of this property could be created like so:

```
kim_property create 1 atomic-mass
kim_property modify 1 key species source-value Al
kim_property modify 1 key mass source-value 26.98154
kim_property modify 1 key mass source-unit amu
```

or, equivalently,

```
kim_property create 1 atomic-mass
kim_property modify 1 key species source-value Al &
  key mass source-value 26.98154 &
  source-unit amu
```
**kim_property Usage Examples and Further Clarifications**

**Create**

```
kim_property create instance_id property_id
```

The `kim_property create` command takes as input a property instance ID and the property definition name, and creates an initial empty property instance data structure. For example,

```
kim_property create 1 atomic-mass
kim_property create 2 cohesive-energy-relation-cubic-crystal
```

creates an empty property instance of the “atomic-mass” property definition with instance ID 1 and an empty instance of the “cohesive-energy-relation-cubic-crystal” property with ID 2. A list of published property definitions in OpenKIM can be found on the properties page.

One can also provide the name of a file in the current working directory or the path of a file containing a valid property definition. For example,

```
kim_property create 1 new-property.edn
```

where “new-property.edn” refers to a file name containing a new property definition that does not exist in OpenKIM.

If the `property_id` given cannot be found in OpenKIM and no file of this name containing a valid property definition can be found, this command will produce an error with an appropriate message. Calling `kim_property create` with the same instance ID multiple times will also produce an error.

**Modify**

```
kim_property modify instance_id key key_name key_name_key key_name_value
```

The `kim_property modify` command incrementally builds the property instance by receiving property definition keys along with associated arguments. Each `key_name` is associated with a map containing one or more key-value pairs (in the form of `key_name_key`-`key_name_value` pairs). For example,

```
kim_property modify 1 key species source-value Al
kim_property modify 1 key mass source-value 26.98154
```

where the special keyword “key” is followed by a `key_name` (“species” or “mass” in the above) and one or more key-value pairs. These key-value pairs may continue until either another “key” keyword is given or the end of the command line is reached. Thus, the above could equivalently be written as

```
kim_property modify 1 key species source-value Al &
    key mass source-value 26.98154 &
    key mass source-unit amu
```

As an example of modifying multiple key-value pairs belonging to the map of a single property key, the following command modifies the map of the “cohesive-potential-energy” property key to contain the key “source-unit” which is assigned a value of “eV” and the key “digits” which is assigned a value of 5:

```
kim_property modify 2 key cohesive-potential-energy source-unit eV digits 5
```

**Note:** The relevant data types of the values in the map are handled automatically based on the specification of the key in the KIM Property Definition. In the example above, this means that the value “eV” will automatically be interpreted as a string while the value 5 will be interpreted as an integer.
The values contained in maps can either be scalars, as in all of the examples above, or arrays depending on which is stipulated in the corresponding Property Definition. For one-dimensional arrays, a single one-based index must be supplied that indicates which element of the array is to be modified. For multidimensional arrays, multiple indices must be given depending on the dimensionality of the array.

**Note:** All array indexing used by *kim_property modify* is one-based, i.e. the indices are enumerated 1, 2, 3, …

**Note:** The dimensionality of arrays are defined in the the corresponding Property Definition. The extent of each dimension of an array can either be a specific finite number or indefinite and determined at run time. If an array has a fixed extent, attempting to modify an out-of-range index will fail with an error message.

For example, the “species” property key of the cohesive-energy-relation-cubic-crystal property is a one-dimensional array that can contain any number of entries based on the number of atoms in the unit cell of a given cubic crystal. To assign an array containing the string “Al” four times to the “source-value” key of the “species” property key, we can do so by issuing:

```
kim_property modify 2 key species source-value 1 Al
kim_property modify 2 key species source-value 2 Al
kim_property modify 2 key species source-value 3 Al
kim_property modify 2 key species source-value 4 Al
```

**Note:** No declaration of the number of elements in this array was given; *kim_property modify* will automatically handle memory management to allow an arbitrary number of elements to be added to the array.

**Note:** In the event that *kim_property modify* is used to set the value of an array index without having set the values of all lesser indices, they will be assigned default values based on the data type associated with the key in the map:

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>int</td>
<td>0</td>
</tr>
<tr>
<td>float</td>
<td>0.0</td>
</tr>
<tr>
<td>string</td>
<td>“”</td>
</tr>
<tr>
<td>file</td>
<td>“”</td>
</tr>
</tbody>
</table>

For example, doing the following:

```
kim_property create 2 cohesive-energy-relation-cubic-crystal
kim_property modify 2 key species source-value 4 Al
```

will result in the “source-value” key in the map for the property key “species” being assigned the array [“”, “”, “”, “Al”].

For convenience, the index argument provided may refer to an inclusive range of indices by specifying two integers separated by a colon (the first integer must be less than or equal to the second integer, and no whitespace should be included). Thus, the snippet above could equivalently be written:

```
kim_property modify 2 key species source-value 1:4 Al Al A1 Al
```

Calling this command with a non-positive index, e.g. *kim_property modify 2 key species source-value 0 Al*, or an incorrect number of input arguments, e.g. *kim_property modify 2 key
species source-value 1:4 Al Al, will result in an error.

As an example of modifying multidimensional arrays, consider the “basis-atoms” key in the cohesive-energy-relation-cubic-crystal property definition. This is a two-dimensional array containing the fractional coordinates of atoms in the unit cell of the cubic crystal. In the case of, e.g. a conventional fcc unit cell, the “source-value” key in the map associated with this key should be assigned the following value:

```
[[(0.0 0.0 0.0), (0.5 0.5 0.0), (0.5 0.0 0.5), (0.0 0.5 0.5)]
```

While each of the twelve components could be set individually, we can instead set each row at a time using colon notation:

```
kim_property modify 2 key basis-atom-coordinates source-value 1 1:3 0.0 0.0 0.0
kim_property modify 2 key basis-atom-coordinates source-value 2 1:3 0.5 0.5 0.0
kim_property modify 2 key basis-atom-coordinates source-value 3 1:3 0.5 0.0 0.5
kim_property modify 2 key basis-atom-coordinates source-value 4 1:3 0.0 0.5 0.5
```

Where the first index given refers to a row and the second index refers to a column. We could, instead, choose to set each column at a time like so:

```
kim_property modify 2 key basis-atom-coordinates source-value 1 4 1:3 0.0 0.5 0.5 0.0 &
kim_property modify 2 key basis-atom-coordinates source-value 2 4 1:3 0.0 0.5 0.0 0.5 &
kim_property modify 2 key basis-atom-coordinates source-value 3 4 1:3 0.0 0.0 0.5 0.5 &
kim_property modify 2 key basis-atom-coordinates source-value 4 4 1:3 0.0 0.5 0.5 &
```

**Note:** Multiple calls of `kim_property modify` made for the same instance ID can be combined into a single invocation, meaning the following are both valid:

```
kim_property modify 2 key basis-atom-coordinates source-value 1 1:3 0.0 0.0 0.0 &
kim_property modify 2 key basis-atom-coordinates source-value 2 1:3 0.5 0.5 0.0 &
kim_property modify 2 key basis-atom-coordinates source-value 3 1:3 0.5 0.0 0.5 &
kim_property modify 2 key basis-atom-coordinates source-value 4 1:3 0.0 0.5 0.5 &
```

```
kim_property modify 2 key short-name source-value 1 fcc &
kim_property modify 2 key species source-value 1:4 Al Al Al Al &
key a source-value 1:6 3.9149 4.0000 4.032 4.0817 4.1602 &
source-unit angstrom &
digits 5 &
key basis-atom-coordinates source-value 1:3 1 0.0 0.0 0.0 &
kim_property modify 2 key basis-atom-coordinates source-value 2 1:3 0.5 0.5 0.0 &
kim_property modify 2 key basis-atom-coordinates source-value 3 1:3 0.5 0.0 0.5 &
kim_property modify 2 key basis-atom-coordinates source-value 4 1:3 0.0 0.5 0.5 &
```

**Note:** For multidimensional arrays, only one colon-separated range is allowed in the index listing. Therefore,

```
kim_property modify 2 key basis-atom-coordinates 1 1:3 0.0 0.0 0.0
```

is valid but

```
kim_property modify 2 key basis-atom-coordinates 1:3 1:3 0.0 0.0 0.0 0.0 0.0 0.0
```

is not.
Note: After one sets a value in a map with the `kim_property modify` command, additional calls will overwrite the previous value.

**Remove**

```
kim_property remove instance_id key key_name
```

The `kim_property remove` command can be used to remove a property key from a property instance. For example,

```
kim_property remove 2 key basis-atom-coordinates
```

**Destroy**

```
kim_property destroy instance_id
```

The `kim_property destroy` command deletes a previously created property instance ID. For example,

```
kim_property destroy 2
```

Note: If this command is called with an instance ID that does not exist, no error is raised.

**Dump**

The `kim_property dump` command can be used to write the content of all currently defined property instances to a file:

```
kim_property dump file
```

For example,

```
kim_property dump results.edn
```

Note: Issuing the `kim_property dump` command clears all existing property instances from memory.

**Citation of OpenKIM IMs**

When publishing results obtained using OpenKIM IMs researchers are requested to cite the OpenKIM project *(Tadmor)*, KIM API *(Elliott)*, and the specific IM codes used in the simulations, in addition to the relevant scientific references for the IM. The citation format for an IM is displayed on its page on OpenKIM along with the corresponding BibTex file, and is automatically added to the LAMMPS `log.cite` file.

Citing the IM software (KIM infrastructure and specific PM or SM codes) used in the simulation gives credit to the researchers who developed them and enables open source efforts like OpenKIM to function.
17.65.4 Restrictions

The set of *kim_commands* is part of the KIM package. It is only enabled if LAMMPS is built with that package. A requirement for the KIM package, is the KIM API library that must be downloaded from the OpenKIM website and installed before LAMMPS is compiled. When installing LAMMPS from binary, the kim-api package is a dependency that is automatically downloaded and installed. The *kim_query* command requires the *libcurl* library to be installed. The *kim_property* command requires *Python* 3.6 or later and the *kim-property* python package to be installed. See the KIM section of the Packages details for details.

Furthermore, when using *kim_commands* to run KIM SMs, any packages required by the native potential being used or other commands or fixes that it invokes must be installed.

kspace_modify slab 3.0
kspace_modify scafacos tolerance energy
```

### 17.66.3 Description

Set parameters used by the kspace solvers defined by the `kspace_style` command. Not all parameters are relevant to all kspace styles.

The `collective` keyword applies only to PPPM. It is set to `no` by default, except on IBM BlueGene machines. If this option is set to `yes`, LAMMPS will use MPI collective operations to remap data for 3d-FFT operations instead of the default point-to-point communication. This is faster on IBM BlueGene machines, and may also be faster on other machines if they have an efficient implementation of MPI collective operations and adequate hardware.

The `compute` keyword allows Kspace computations to be turned off, even though a `kspace_style` is defined. This is not useful for running a real simulation, but can be useful for debugging purposes or for computing only partial forces that do not include the Kspace contribution. You can also do this by simply not defining a `kspace_style`, but a Kspace-compatible `pair_style` requires a kspace style to be defined. This keyword gives you that option.

The `cutoff/adjust` keyword applies only to MSM. If this option is turned on, the Coulombic cutoff will be automatically adjusted at the beginning of the run to give the desired estimated error. Other cutoffs such as LJ will not be affected.
If the grid is not set using the mesh command, this command will also attempt to use the optimal grid that minimizes cost using an estimate given by (Hardy). Note that this cost estimate is not exact, somewhat experimental, and still may not yield the optimal parameters.

The diff keyword specifies the differentiation scheme used by the PPPM method to compute forces on particles given electrostatic potentials on the PPPM mesh. The ik approach is the default for PPPM and is the original formulation used in (Hockney). It performs differentiation in Kspace, and uses 3 FFTs to transfer each component of the computed fields back to real space for total of 4 FFTs per timestep.

The analytic differentiation ad approach uses only 1 FFT to transfer information back to real space for a total of 2 FFTs per timestep. It then performs analytic differentiation on the single quantity to generate the 3 components of the electric field at each grid point. This is sometimes referred to as “smoothed” PPPM. This approach requires a somewhat larger PPPM mesh to achieve the same accuracy as the ik method. Currently, only the ik method (default) can be used for a triclinic simulation cell with PPPM. The ad method is always used for MSM.

Note: Currently, not all PPPM styles support the ad option. Support for those PPPM variants will be added later.

The disp/auto option controls whether the pppm/disp is allowed to generate PPPM parameters automatically. If set to no, parameters have to be specified using the gewald/disp, mesh/disp, force/disp/real or force/disp/kspace keywords, or the code will stop with an error message. When this option is set to yes, the error message will not appear and the simulation will start. For a typical application, using the automatic parameter generation will provide simulations that are either inaccurate or slow. Using this option is thus not recommended. For guidelines on how to obtain good parameters, see the How-To discussion.

The fftbench keyword applies only to PPPM. It is off by default. If this option is turned on, LAMMPS will perform a short FFT benchmark computation and report its timings, and will thus finish some seconds later than it would if this option were off.

The force/disp/real and force/disp/kspace keywords set the force accuracy for the real and reciprocal space computations for the dispersion part of pppm/disp. As shown in (Isele-Holder), optimal performance and accuracy in the results is obtained when these values are different.

The force keyword overrides the relative accuracy parameter set by the kspace_style command with an absolute accuracy. The accuracy determines the RMS error in per-atom forces calculated by the long-range solver and is thus specified in force units. A negative value for the accuracy setting means to use the relative accuracy parameter. The accuracy setting is used in conjunction with the pairwise cutoff to determine the number of K-space vectors for style ewald, the FFT grid size for style pppm, or the real space grid size for style msm.

The gewald keyword sets the value of the Ewald or PPPM G-ewald parameter for charge as rinv in reciprocal distance units. Without this setting, LAMMPS chooses the parameter automatically as a function of cutoff, precision, grid spacing, etc. This means it can vary from one simulation to the next which may not be desirable for matching a KSpace solver to a pre-tabulated pairwise potential. This setting can also be useful if Ewald or PPPM fails to choose a good grid spacing and G-ewald parameter automatically. If the value is set to 0.0, LAMMPS will choose the G-ewald parameter automatically. MSM does not use the gewald parameter.
The \textit{gewald/disp} keyword sets the value of the Ewald or PPPM G-ewald parameter for dispersion as \textit{rinv} in reciprocal distance units. It has the same meaning as the \textit{gewald} setting for Coulombics.

The \textit{kmax/ewald} keyword sets the number of kspace vectors in each dimension for kspace style \textit{ewald}. The three values must be positive integers, or else (0,0,0), which unsets the option. When this option is not set, the Ewald sum scheme chooses its own kspace vectors, consistent with the user-specified accuracy and pairwise cutoff. In any case, if kspace style \textit{ewald} is invoked, the values used are printed to the screen and the log file at the start of the run.

The \textit{mesh} keyword sets the grid size for kspace style \textit{pppm} or \textit{msm}. In the case of PPPM, this is the FFT mesh, and each dimension must be factorizable into powers of 2, 3, and 5. In the case of MSM, this is the finest scale real-space mesh, and each dimension must be factorizable into powers of 2. When this option is not set, the PPPM or MSM solver chooses its own grid size, consistent with the user-specified accuracy and pairwise cutoff. Values for \textit{x,y,z} of 0,0,0 unset the option.

The \textit{mesh/disp} keyword sets the grid size for kspace style \textit{pppm/disp}. This is the FFT mesh for long-range dispersion and each dimension must be factorizable into powers of 2, 3, and 5. When this option is not set, the PPPM solver chooses its own grid size, consistent with the user-specified accuracy and pairwise cutoff. Values for \textit{x,y,z} of 0,0,0 unset the option.

The \textit{minorder} keyword allows LAMMPS to reduce the \textit{order} setting if necessary to keep the communication of ghost grid point limited to exchanges between nearest-neighbor processors. See the discussion of the \textit{overlap} keyword for details. If the \textit{overlap} keyword is set to \textit{yes}, which is the default, this is never needed. If it set to \textit{no} and overlap occurs, then LAMMPS will reduce the order setting, one step at a time, until the ghost grid overlap only extends to nearest neighbor processors. The \textit{minorder} keyword limits how small the \textit{order} setting can become. The minimum allowed value for PPPM is 2, which is the default. If \textit{minorder} is set to the same value as \textit{order} then no reduction is allowed, and LAMMPS will generate an error if the grid communication is non-nearest-neighbor and \textit{overlap} is set to \textit{no}. The \textit{minorder} keyword is not currently supported in MSM.

The \textit{mix/disp} keyword selects the mixing rule for the dispersion coefficients. With \textit{pair}, the dispersion coefficients of unlike types are computed as indicated with \textit{pair_modify}. With \textit{geom}, geometric mixing is enforced on the dispersion coefficients in the kspace coefficients. When using the arithmetic mixing rule, this will speed-up the simulations but introduces some error in the force computations, as shown in (Wennberg). With \textit{none}, it is assumed that no mixing rule is applicable. Splitting of the dispersion coefficients will be performed as described in (Isele-Holder).

This splitting can be influenced with the \textit{splittol} keywords. Only the eigenvalues that are larger than \textit{tol} compared to the largest eigenvalues are included. Using this keywords the original matrix of dispersion coefficients is approximated. This leads to faster computations, but the accuracy in the reciprocal space computations of the dispersion part is decreased.

The \textit{order} keyword determines how many grid spacings an atom’s charge extends when it is mapped to the grid in kspace style \textit{pppm} or \textit{msm}. The default for this parameter is 5 for PPPM and 8 for MSM, which means each charge spans 5 or 8 grid cells in each dimension, respectively. For the LAMMPS implementation of MSM, the order can range from 4 to 10 and must be even. For PPPM, the minimum allowed setting is 2 and the maximum allowed setting is 7. The larger the value of this parameter, the smaller that LAMMPS will set the grid size, to achieve the requested accuracy. Conversely, the smaller the order value, the larger the grid size will be. Note that there is an inherent trade-off involved: a small grid will lower the cost of FFTs or MSM direct sum, but a larger order parameter will increase the cost of interpolating charge/fields to/from the grid.
The PPPM order parameter may be reset by LAMMPS when it sets up the FFT grid if the implied grid stencil extends beyond the grid cells owned by neighboring processors. Typically this will only occur when small problems are run on large numbers of processors. A warning will be generated indicating the order parameter is being reduced to allow LAMMPS to run the problem. Automatic adjustment of the order parameter is not supported in MSM.

The order/disp keyword determines how many grid spacings an atom’s dispersion term extends when it is mapped to the grid in kspace style pppm/disp. It has the same meaning as the order setting for Coulombics.

The overlap keyword can be used in conjunction with the minorder keyword with the PPPM styles to adjust the amount of communication that occurs when values on the FFT grid are exchanged between processors. This communication is distinct from the communication inherent in the parallel FFTs themselves, and is required because processors interpolate charge and field values using grid point values owned by neighboring processors (i.e., ghost point communication). If the overlap keyword is set to yes then this communication is allowed to extend beyond nearest-neighbor processors, e.g., when using lots of processors on a small problem. If it is set to no then the communication will be limited to nearest-neighbor processors and the order setting will be reduced if necessary, as explained by the minorder keyword discussion. The overlap keyword is always set to yes in MSM.

The pressure/scalar keyword applies only to MSM. If this option is turned on, only the scalar pressure (i.e., \( \frac{(P_{xx} + P_{yy} + P_{zz})}{3.0} \)) will be computed, which can be used, for example, to run an isotropic barostat. Computing the full pressure tensor with MSM is expensive, and this option provides a faster alternative. The scalar pressure is computed using a relationship between the Coulombic energy and pressure \( (\text{Hummer}) \) instead of using the virial equation. This option cannot be used to access individual components of the pressure tensor, to compute per-atom virial, or with suffix kspace/pair styles of MSM, like OMP or GPU.

The scafacos keyword is used for settings that are passed to the ScaFaCoS library when using kspace_style scafacos.

The tolerance option affects how the accuracy specified with the kspace_style command is interpreted by ScaFaCoS. The following values may be used:

- energy = absolute accuracy in total Coulombic energy
- energy_rel = relative accuracy in total Coulombic energy
- potential = absolute accuracy in total Coulombic potential
- potential_rel = relative accuracy in total Coulombic potential
- field = absolute accuracy in electric field
- field_rel = relative accuracy in electric field

The values with suffix _rel indicate the tolerance is a relative tolerance; the other values impose an absolute tolerance on the given quantity. Absolute tolerance in this case means, that for a given quantity \( q \) and a given absolute tolerance \( t_a \) the result should be between \( q - t_a \) and \( q + t_a \). For a relative tolerance \( t_r \) the relative error should not be greater than \( t_r \), i.e., \( \text{abs}(1 - (\text{result}/q)) < t_r \). As a consequence of this, the tolerance type should be checked, when performing computations with a high absolute field / energy. E.g., if the total energy in the system is 1000000.0 an absolute tolerance of 1e-3 would mean that the result has to be between 999999.999 and 1000000.001, which would be equivalent to a relative tolerance of 1e-9.

The energy and energy_rel values, set a tolerance based on the total Coulombic energy of the system. The potential and potential_rel set a tolerance based on the per-atom Coulombic energy. The field and field_rel tolerance types set a tolerance based on the electric field values computed by ScaFaCoS. Since per-atom forces are derived from the per-atom electric field, this effectively sets a tolerance on the forces, similar to other LAMMPS KSpace styles, as explained on the kspace_style doc page.

Note that not all ScaFaCoS solvers support all tolerance types. These are the allowed values for each method:
• fmm = energy and energy_rel
• p2nfft = field (1d-, 2d-, 3d-periodic systems) or potential (0d-periodic)
• p3m = field
• ewald = field
• direct = has no tolerance tuning

If the tolerance type is not changed, the default values for the tolerance type are the first values in the above list, e.g. energy is the default tolerance type for the fmm solver.

The fmm_tuning option is only relevant when using the FMM method. It activates (value=1) or deactivates (value=0) an internal tuning mechanism for the FMM solver. The tuning operation runs sequentially and can be very time-consuming. Usually it is not needed for systems with a homogeneous charge distribution. The default for this option is therefore 0. The FMM internal tuning is performed once, when the solver is set up.

The slab keyword allows an Ewald or PPPM solver to be used for a systems that are periodic in x,y but non-periodic in z - a boundary setting of “boundary p p f”. This is done by treating the system as if it were periodic in z, but inserting empty volume between atom slabs and removing dipole inter-slab interactions so that slab-slab interactions are effectively turned off. The volfactor value sets the ratio of the extended dimension in z divided by the actual dimension in z. The recommended value is 3.0. A larger value is inefficient; a smaller value introduces unwanted slab-slab interactions. The use of fixed boundaries in z means that the user must prevent particle migration beyond the initial z-bounds, typically by providing a wall-style fix. The methodology behind the slab option is explained in the paper by (Yeh). The slab option is also extended to non-neutral systems (Ballenegger).

An alternative slab option can be invoked with the nozforce keyword in lieu of the volfactor. This turns off all kspace forces in the z direction. The nozforce option is not supported by MSM. For MSM, any combination of periodic, non-periodic, or shrink-wrapped boundaries can be set using boundary (the slab approximation in not needed). The slab keyword is not currently supported by Ewald or PPPM when using a triclinic simulation cell. The slab correction has also been extended to point dipole interactions (Klapp) in kspace_style ewald/disp, ewald/dipole, and pppm/dipole.

Note: If you wish to apply an electric field in the Z-direction, in conjunction with the slab keyword, you should do it by adding explicit charged particles to the +/- Z surfaces. If you do it via the fix efield command, it will not give the correct dielectric constant due to the Yeh/Berkowitz (Yeh) correction not being compatible with how fix efield works.

The force/disp/real and force/disp/kspace keywords set the force accuracy for the real and reciprocal space computations for the dispersion part of pppm/disp. As shown in (Isele-Holder), optimal performance and accuracy in the results is obtained when these values are different.

The disp/auto option controls whether the pppm/disp is allowed to generate PPPM parameters automatically. If set to no, parameters have to be specified using the gewald/disp, mesh/disp, force/disp/real or force/disp/kspace keywords, or the code will stop with an error message. When this option is set to yes, the error message will not appear and the simulation will start. For a typical application, using the automatic parameter generation will provide simulations that are either inaccurate or slow. Using this option is thus not recommended. For guidelines on how to obtain good parameters, see the Howto dispersion doc page.
17.66.4 Restrictions

none

17.66.5 Related commands

kspace_style, boundary

17.66.6 Default

The option defaults are mesh = mesh/disp = 0 0 0, order = order/disp = 5 (PPPM), order = 10 (MSM), minorder = 2, overlap = yes, force = -1.0, gewald = gewald/disp = 0.0, slab = 1.0, compute = yes, cutoff/adjust = yes (MSM), pressure/scalar = yes (MSM), ffitbench = no (PPPM), diff = ik (PPPM), mix/disp = pair, force/disp/real = -1.0, force/disp/kspace = -1.0, split = 0, tol = 1.0e-6, and disp/auto = no. For ppm/intel, order = order/disp = 7. For scafacos settings, the scafacos tolerance option depends on the method chosen, as documented above. The scafacos fmm_tuning default = 0.

### 17.67.3 Description

Define a long-range solver for LAMMPS to use each timestep to compute long-range Coulombic interactions or long-range $1/r^6$ interactions. Most of the long-range solvers perform their computation in K-space, hence the name of this command.

When such a solver is used in conjunction with an appropriate pair style, the cutoff for Coulombic or $1/r^N$ interactions is effectively infinite. If the Coulombic case, this means each charge in the system interacts with charges in an infinite array of periodic images of the simulation domain.

Note that using a long-range solver requires use of a matching pair style to perform consistent short-range pairwise calculations. This means that the name of the pair style contains a matching keyword to the name of the KSpace style, as in this table:

<table>
<thead>
<tr>
<th>Pair style</th>
<th>KSpace style</th>

</tbody>
</table>

The ewald style performs a standard Ewald summation as described in any solid-state physics text.

The ewald/disp style adds a long-range dispersion sum option for $1/r^6$ potentials and is useful for simulation of interfaces (Veld). It also performs standard Coulombic Ewald summations, but in a more efficient manner than the ewald style. The $1/r^6$ capability means that Lennard-Jones or Buckingham potentials can be used without a cutoff, i.e., they become full long-range potentials. The ewald/disp style can also be used with point-dipoles, see (Toukmaji).

The ewald/dipole style adds long-range standard Ewald summations for dipole-dipole interactions, see (Toukmaji).

The ewald/dipole/spin style adds long-range standard Ewald summations for magnetic dipole-dipole interactions between magnetic spins.

The ppm style invokes a particle-particle particle-mesh solver (Hockney) which maps atom charge to a 3d mesh, uses 3d FFTs to solve Poisson's equation on the mesh, then interpolates electric fields on the mesh points back to the atoms. It is closely related to the particle-mesh Ewald technique (PME) (Darden) used in AMBER and CHARMM. The cost of traditional Ewald summation scales as $N^2$ where $N$ is the number of atoms in the system. The PPPM solver scales as $N \log N$ due to the FFTs, so it is almost always a faster choice (Pollock).

The ppm/cg style is identical to the ppm style except that it has an optimization for systems where most particles are uncharged. Similarly the msm/cg style implements the same optimization for msm. The optional smallq argument defines the cutoff for the absolute charge value which determines whether a particle is considered charged or not. Its default value is 1.0e-5.

The ppm/dipole style invokes a particle-particle particle-mesh solver for dipole-dipole interactions, following the method of (Cerda).
The `pppm/dipole/spin` style invokes a particle-particle particle-mesh solver for magnetic dipole-dipole interactions between magnetic spins.

The `pppm/tip4p` style is identical to the `pppm` style except that it adds a charge at the massless fourth site in each TIP4P water molecule. It should be used with `pair styles` with a `tip4p/long` in their style name.

The `pppm/stagger` style performs calculations using two different meshes, one shifted slightly with respect to the other. This can reduce force aliasing errors and increase the accuracy of the method for a given mesh size. Or a coarser mesh can be used for the same target accuracy, which saves CPU time. However, there is a trade-off since FFTs on two meshes are now performed which increases the computation required. See *(Cerutti)*, *(Neelov)*, and *(Hockney)* for details of the method.

For high relative accuracy, using staggered PPPM allows the mesh size to be reduced by a factor of 2 in each dimension as compared to regular PPPM (for the same target accuracy). This can give up to a 4x speedup in the KSpace time (8x less mesh points, 2x more expensive). However, for low relative accuracy, the staggered PPPM mesh size may be essentially the same as for regular PPPM, which means the method will be up to 2x slower in the KSpace time (simply 2x more expensive). For more details and timings, see the `Speed tips` doc page.

**Note:** Using `pppm/stagger` may not give the same increase in the accuracy of energy and pressure as it does in forces, so some caution must be used if energy and/or pressure are quantities of interest, such as when using a barostat.

The `pppm/disp` and `pppm/disp/tip4p` styles add a mesh-based long-range dispersion sum option for $1/r^6$ potentials *(Isele-Holder)*, similar to the `ewald/disp` style. The $1/r^6$ capability means that Lennard-Jones or Buckingham potentials can be used without a cutoff, i.e. they become full long-range potentials.

For these styles, you will possibly want to adjust the default choice of parameters by using the `kspace_modify` command. This can be done by either choosing the Ewald and grid parameters, or by specifying separate accuracies for the real and kspace calculations. When not making any settings, the simulation will stop with an error message. Further information on the influence of the parameters and how to choose them is described in *(Isele-Holder)*, *(Isele-Holder2)* and the `Howto dispersion` doc page.

**Note:** All of the PPPM styles can be used with single-precision FFTs by using the compiler switch `-DFFT_SINGLE` for the FFT_INC setting in your low-level Makefile. This setting also changes some of the PPPM operations (e.g. mapping charge to mesh and interpolating electric fields to particles) to be performed in single precision. This option can speed-up long-range calculations, particularly in parallel or on GPUs. The use of the `-DFFT_SINGLE` flag is discussed on the `Build settings` doc page. MSM does not currently support the `-DFFT_SINGLE` compiler switch.

The `msm` style invokes a multi-level summation method MSM solver, *(Hardy)* or *(Hardy2)*, which maps atom charge to a 3d mesh, and uses a multi-level hierarchy of coarser and coarser meshes on which direct Coulomb solvers are done. This method does not use FFTs and scales as $N$. It may therefore be faster than the other K-space solvers for relatively large problems when running on large core counts. MSM can also be used for non-periodic boundary conditions and for mixed periodic and non-periodic boundaries.

MSM is most competitive versus Ewald and PPPM when only relatively low accuracy forces, about 1e-4 relative error or less accurate, are needed. Note that use of a larger Coulombic cutoff (i.e. 15 angstroms instead of 10 angstroms) provides better MSM accuracy for both the real space and grid computed forces.

Currently calculation of the full pressure tensor in MSM is expensive. Using the `kspace_modify pressure/scalar yes` command provides a less expensive way to compute the scalar pressure $(P_{xx} + P_{yy} + P_{zz})/3.0$. The scalar pressure can be used, for example, to run an isotropic barostat. If the full pressure tensor is needed, then calculating the pressure at every timestep or using a fixed pressure simulation with MSM will cause the code to run slower.
The *scafacos* style is a wrapper on the ScaFaCoS Coulomb solver library which provides a variety of solver methods which can be used with LAMMPS. The paper by *(Who)* gives an overview of ScaFaCoS.

ScaFaCoS was developed by a consortium of German research facilities with a BMBF (German Ministry of Science and Education) funded project in 2009-2012. Participants of the consortium were the Universities of Bonn, Chemnitz, Stuttgart, and Wuppertal as well as the Forschungszentrum Juelich.

The library is available for download at “http://scafacos.de” or can be cloned from the git-repository “git://github.com/scafacos/scafacos.git”.

In order to use this KSpace style, you must download and build the ScaFaCoS library, then build LAMMPS with the USER-SCAFACOS package installed package which links LAMMPS to the ScaFaCoS library. See details on *this page*.

**Note:** Unlike other KSpace solvers in LAMMPS, ScaFaCoS computes all Coulombic interactions, both short- and long-range. Thus you should NOT use a Coulombic pair style when using kspace_style scafacos. This also means the total Coulombic energy (short- and long-range) will be tallied for *thermodynamic output* command as part of the *elong* keyword; the *ecoul* keyword will be zero.

**Note:** See the current restriction below about use of ScaFaCoS in LAMMPS with molecular charged systems or the TIP4P water model.

The specified *method* determines which ScaFaCoS algorithm is used. These are the ScaFaCoS methods currently available from LAMMPS:

- *fmm* = Fast Multi-Pole method
- *p2nfft* = FFT-based Coulomb solver
- *ewald* = Ewald summation
- *direct* = direct O(N^2) summation
- *p3m* = PPPM

We plan to support additional ScaFaCoS solvers from LAMMPS in the future. For an overview of the included solvers, refer to *(Sutmann)*

The specified *accuracy* is similar to the accuracy setting for other LAMMPS KSpace styles, but is passed to ScaFaCoS, which can interpret it in different ways for different methods it supports. Within the ScaFaCoS library the *accuracy* is treated as a tolerance level (either absolute or relative) for the chosen quantity, where the quantity can be either the Coulombic field values, the per-atom Coulombic energy or the total Coulombic energy. To select from these options, see the *kspace_modify scafacos accuracy* doc page.

The *kspace_modify scafacos* command also explains other ScaFaCoS options currently exposed to LAMMPS.

The specified *accuracy* determines the relative RMS error in per-atom forces calculated by the long-range solver. It is set as a dimensionless number, relative to the force that two unit point charges (e.g. 2 monovalent ions) exert on each other at a distance of 1 Angstrom. This reference value was chosen as representative of the magnitude of electrostatic forces in atomic systems. Thus an accuracy value of 1.0e-4 means that the RMS error will be a factor of 10000 smaller than the reference force.

The accuracy setting is used in conjunction with the pairwise cutoff to determine the number of K-space vectors for style *ewald* or the grid size for style *pppm* or *msm*. 
Note that style *pppm* only computes the grid size at the beginning of a simulation, so if the length or triclinic tilt of the simulation cell increases dramatically during the course of the simulation, the accuracy of the simulation may degrade. Likewise, if the *kspace_modify slab* option is used with shrink-wrap boundaries in the z-dimension, and the box size changes dramatically in z. For example, for a triclinic system with all three tilt factors set to the maximum limit, the PPPM grid should be increased roughly by a factor of 1.5 in the y direction and 2.0 in the z direction as compared to the same system using a cubic orthogonal simulation cell. One way to handle this issue if you have a long simulation where the box size changes dramatically is to break it into shorter simulations (multiple *run* commands). This works because the grid size is re-computed at the beginning of each run. Another way to ensure the described accuracy requirement is met is to run a short simulation at the maximum expected tilt or length, note the required grid size, and then use the *kspace_modify mesh* command to manually set the PPPM grid size to this value for the long run. The simulation then will be “too accurate” for some portion of the run.

RMS force errors in real space for *ewald* and *pppm* are estimated using equation 18 of (Kolafa), which is also referenced as equation 9 of (Petersen). RMS force errors in K-space for *ewald* are estimated using equation 11 of (Petersen), which is similar to equation 32 of (Kolafa). RMS force errors in K-space for *pppm* are estimated using equation 38 of (Deserno). RMS force errors for *msm* are estimated using ideas from chapter 3 of (Hardy), with equation 3.197 of particular note. When using *msm* with non-periodic boundary conditions, it is expected that the error estimation will be too pessimistic. RMS force errors for dipoles when using *ewald/disp* or *ewald/dipole* are estimated using equations 33 and 46 of (Wang). The RMS force errors for *pppm/dipole* are estimated using the equations in (Cerda).

See the *kspace_modify* command for additional options of the K-space solvers that can be set, including a *force* option for setting an absolute RMS error in forces, as opposed to a relative RMS error.

Styles with a *gpu*, *intel*, *kk*, *omp*, or *opt* suffix are functionally the same as the corresponding style without the suffix. They have been optimized to run faster, depending on your available hardware, as discussed on the Speed packages doc page. The accelerated styles take the same arguments and should produce the same results, except for round-off and precision issues.

More specifically, the *pppm/gpu* style performs charge assignment and force interpolation calculations on the GPU. These processes are performed either in single or double precision, depending on whether the -DFFT_SINGLE setting was specified in your low-level Makefile, as discussed above. The FFTs themselves are still calculated on the CPU. If *pppm/gpu* is used with a GPU-enabled pair style, part of the PPPM calculation can be performed concurrently on the GPU while other calculations for non-bonded and bonded force calculation are performed on the CPU.

The *pppm/kk* style performs charge assignment and force interpolation calculations, along with the FFTs themselves, on the GPU or (optionally) threaded on the CPU when using OpenMP and FFTW3.

These accelerated styles are part of the GPU, USER-INTEL, KOKKOS, USER-OMP, and OPT packages respectively. They are only enabled if LAMMPS was built with those packages. See the Build package doc page for more info.

See the Speed packages doc page for more instructions on how to use the accelerated styles effectively.

### 17.67.4 Restrictions

Note that the long-range electrostatic solvers in LAMMPS assume conducting metal (tinfoil) boundary conditions for both charge and dipole interactions. Vacuum boundary conditions are not currently supported.

The *ewald/disp*, *ewald*, *pppm*, and *msm* styles support non-orthogonal (triclinic symmetry) simulation boxes. However, triclinic simulation cells may not yet be supported by all suffix versions of these styles.

All of the kspace styles are part of the KSPACE package. They are only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

For MSM, a simulation must be 3d and one can use any combination of periodic, non-periodic, or shrink-wrapped boundaries (specified using the *boundary* command).
For Ewald and PPPM, a simulation must be 3d and periodic in all dimensions. The only exception is if the slab option is set with `kspace_modify`, in which case the xy dimensions must be periodic and the z dimension must be non-periodic.

The scafaK KSpace style will only be enabled if LAMMPS is built with the USER-SCAFACOS package. See the Build package doc page for more info.

The use of ScaFaCos in LAMMPS does not yet support molecular charged systems where the short-range Coulombic interactions between atoms in the same bond/angle/dihedral are weighted by the `special_bonds` command. Likewise it does not support the “TIP4P water style” where a fictitious charge site is introduced in each water molecule. Finally, the methods `p3m` and `ewald` do not support computing the virial, so this contribution is not included.

17.69.3 Description

Define a lattice for use by other commands. In LAMMPS, a lattice is simply a set of points in space, determined by a unit cell with basis atoms, that is replicated infinitely in all dimensions. The arguments of the lattice command can be used to define a wide variety of crystallographic lattices.

A lattice is used by LAMMPS in two ways. First, the `create_atoms` command creates atoms on the lattice points inside the simulation box. Note that the `create_atoms` command allows different atom types to be assigned to different basis atoms of the lattice. Second, the lattice spacing in the x,y,z dimensions implied by the lattice, can be used by other commands as distance units (e.g. `create_box`, `region`, and `velocity`), which are often convenient to use when the underlying problem geometry is atoms on a lattice.

The lattice style must be consistent with the dimension of the simulation - see the `dimension` command. Styles `sc` or `bcc` or `fcc` or `hcp` or `diamond` are for 3d problems. Styles `sq` or `sq2` or `hex` are for 2d problems. Style `custom` can be used for either 2d or 3d problems.

A lattice consists of a unit cell, a set of basis atoms within that cell, and a set of transformation parameters (scale, origin, orient) that map the unit cell into the simulation box. The vectors a1,a2,a3 are the edge vectors of the unit cell. This is the nomenclature for “primitive” vectors in solid-state crystallography, but in LAMMPS the unit cell they determine does not have to be a “primitive cell” of minimum volume.

Note that the lattice command can be used multiple times in an input script. Each time it is invoked, the lattice attributes are re-defined and are used for all subsequent commands (that use lattice attributes). For example, a sequence of lattice, `region`, and `create_atoms` commands can be repeated multiple times to build a poly-crystalline model with different geometric regions populated with atoms in different lattice orientations.

A lattice of style `none` does not define a unit cell and basis set, so it cannot be used with the `create_atoms` command. However it does define a lattice spacing via the specified scale parameter. As explained above the lattice spacings in x,y,z can be used by other commands as distance units. No additional keyword/value pairs can be specified for the `none` style. By default, a “lattice none 1.0” is defined, which means the lattice spacing is the same as one distance unit, as defined by the `units` command.
Lattice command 691

Lattices of style \textit{sc}, \textit{fcc}, \textit{bcc}, and \textit{diamond} are 3d lattices that define a cubic unit cell with edge length = 1.0. This means $a_1 = 1 0 0$, $a_2 = 0 1 0$, and $a_3 = 0 0 1$. Style \textit{hcp} has $a_1 = 1 0 0$, $a_2 = 0 \sqrt{3} 0$, and $a_3 = 0 0 \sqrt{8/3}$. The placement of the basis atoms within the unit cell are described in any solid-state physics text. A \textit{sc} lattice has 1 basis atom at the lower-left-bottom corner of the cube. A \textit{bcc} lattice has 2 basis atoms, one at the corner and one at the center of the cube. A \textit{fcc} lattice has 4 basis atoms, one at the corner and 3 at the cube face centers. A \textit{hcp} lattice has 4 basis atoms, two in the $z = 0$ plane and 2 in the $z = 0.5$ plane. A \textit{diamond} lattice has 8 basis atoms.

Lattices of style \textit{sq} and \textit{sq2} are 2d lattices that define a square unit cell with edge length = 1.0. This means $a_1 = 1 0 0$ and $a_2 = 0 1 0$. A \textit{sq} lattice has 1 basis atom at the lower-left corner of the square. A \textit{sq2} lattice has 2 basis atoms, one at the corner and one at the center of the square. A \textit{hex} style is also a 2d lattice, but the unit cell is rectangular, with $a_1 = 1 0 0$ and $a_2 = 0 \sqrt{3} 0$. It has 2 basis atoms, one at the corner and one at the center of the rectangle.

A lattice of style \textit{custom} allows you to specify \textit{a1}, \textit{a2}, \textit{a3}, and a list of basis atoms to put in the unit cell. By default, \textit{a1} and \textit{a2} and \textit{a3} are 3 orthogonal unit vectors (edges of a unit cube). But you can specify them to be of any length and non-orthogonal to each other, so that they describe a tilted parallelepiped. Via the \textit{basis} keyword you add atoms, one at a time, to the unit cell. Its arguments are fractional coordinates ($0.0 \leq x,y,z < 1.0$). The position vector $x$ of a basis atom within the unit cell is thus a linear combination of the unit cell’s 3 edge vectors, i.e. $x = bx a1 + by a2 + bz a3$, where $bx,by,bz$ are the 3 values specified for the \textit{basis} keyword.

This sub-section discusses the arguments that determine how the idealized unit cell is transformed into a lattice of points within the simulation box.

The \textit{scale} argument determines how the size of the unit cell will be scaled when mapping it into the simulation box. I.e. it determines a multiplicative factor to apply to the unit cell, to convert it to a lattice of the desired size and distance units in the simulation box. The meaning of the \textit{scale} argument depends on the \textit{units} being used in your simulation.

For all unit styles except \textit{lj}, the scale argument is specified in the distance units defined by the unit style. For example, in \textit{real} or \textit{metal} units, if the unit cell is a unit cube with edge length 1.0, specifying \textit{scale} = 3.52 would create a cubic lattice with a spacing of 3.52 Angstroms. In \textit{cgs} units, the spacing would be 3.52 cm.

For unit style \textit{lj}, the scale argument is the Lennard-Jones reduced density, typically written as \textit{rho*}. LAMMPS converts this value into the multiplicative factor via the formula “factor$^\text{dim} = \text{rho}/\text{rho*}”$, where \textit{rho} = \textit{N}/\textit{V} with \textit{V} = the volume of the lattice unit cell and \textit{N} = the number of basis atoms in the unit cell (described below), and \textit{dim} = 2 or 3 for the dimensionality of the simulation. Effectively, this means that if LJ particles of size \textit{sigma} = 1.0 are used in the simulation, the lattice of particles will be at the desired reduced density.

The \textit{origin} option specifies how the unit cell will be shifted or translated when mapping it into the simulation box. The $x,y,z$ values are fractional values ($0.0 \leq x,y,z < 1.0$) meaning shift the lattice by a fraction of the lattice spacing in each dimension. The meaning of “lattice spacing” is discussed below.

The \textit{orient} option specifies how the unit cell will be rotated when mapping it into the simulation box. The \textit{dim} argument is one of the 3 coordinate axes in the simulation box. The other 3 arguments are the crystallographic direction in the lattice that you want to orient along that axis, specified as integers. E.g. “orient x 2 1 0” means the x-axis in the simulation box will be the [210] lattice direction, and similarly for y and z. The 3 lattice directions you specify do not have to be unit vectors, but they must be mutually orthogonal and obey the right-hand rule, i.e. (X cross Y) points in the Z direction.

\textbf{Note:} The preceding paragraph describing lattice directions is only valid for orthogonal cubic unit cells (or square in 2d). If you are using a \textit{hcp} or \textit{hex} lattice or the more general lattice style \textit{custom} with non-orthogonal a1,a2,a3 vectors, then you should think of the 3 \textit{orient} vectors as creating a 3x3 rotation matrix which is applied to a1,a2,a3 to rotate the original unit cell to a new orientation in the simulation box.

Several LAMMPS commands have the option to use distance units that are inferred from “lattice spacings” in the x,y,z box directions. E.g. the \textit{region} command can create a block of size 10x20x20, where 10 means 10 lattice spacings in the x direction.
Note: Though they are called lattice spacings, all the commands that have a “units lattice” option, simply use the 3 values as scale factors on the distance units defined by the `units` command. Thus if you do not like the lattice spacings computed by LAMMPS (e.g. for a non-orthogonal or rotated unit cell), you can define the 3 values to be whatever you wish, via the `spacing` option.

If the `spacing` option is not specified, the lattice spacings are computed by LAMMPS in the following way. A unit cell of the lattice is mapped into the simulation box (scaled and rotated), so that it now has (perhaps) a modified size and orientation. The lattice spacing in X is defined as the difference between the min/max extent of the x coordinates of the 8 corner points of the modified unit cell (4 in 2d). Similarly, the Y and Z lattice spacings are defined as the difference in the min/max of the y and z coordinates.

Note that if the unit cell is orthogonal with axis-aligned edges (no rotation via the `orient` keyword), then the lattice spacings in each dimension are simply the scale factor (described above) multiplied by the length of a1,a2,a3. Thus a hex style lattice with a scale factor of 3.0 Angstroms, would have a lattice spacing of 3.0 in x and 3*sqrt(3.0) in y.

Note: For non-orthogonal unit cells and/or when a rotation is applied via the `orient` keyword, then the lattice spacings computed by LAMMPS are typically less intuitive. In particular, in these cases, there is no guarantee that a particular lattice spacing is an integer multiple of the periodicity of the lattice in that direction. Thus, if you create an orthogonal periodic simulation box whose size in a dimension is a multiple of the lattice spacing, and then fill it with atoms via the `create_atoms` command, you will NOT necessarily create a periodic system. I.e. atoms may overlap incorrectly at the faces of the simulation box.

The `spacing` option sets the 3 lattice spacings directly. All must be non-zero (use 1.0 for dz in a 2d simulation). The specified values are multiplied by the multiplicative factor described above that is associated with the scale factor. Thus a spacing of 1.0 means one unit cell edge length independent of the scale factor. As mentioned above, this option can be useful if the spacings LAMMPS computes are inconvenient to use in subsequent commands, which can be the case for non-orthogonal or rotated lattices.

Note that whenever the lattice command is used, the values of the lattice spacings LAMMPS calculates are printed out. Thus their effect in commands that use the spacings should be decipherable.

Example commands for generating a Wurtzite crystal (courtesy of Aidan Thompson), with its 8 atom unit cell.

```
variable a equal 4.340330
variable b equal $a*sqrt(3.0)
variable c equal $a*sqrt(8.0/3.0)
variable third equal 1.0/3.0
variable five6 equal 5.0/6.0

17.69.4 Restrictions

The \textit{a1,a2,a3,basis} keywords can only be used with style \textit{custom}.

17.69.5 Related commands

\textit{dimension, create_atoms, region}

17.69.6 Default

\begin{verbatim}
lattice none 1.0
\end{verbatim}

For other lattice styles, the option defaults are \textit{origin = 0.0 0.0 0.0, orient = x 1 0 0, orient = y 0 1 0, orient = z 0 0 1, a1 = 1 0 0, a2 = 0 1 0, and a3 = 0 0 1}.

17.70 log command

17.70.1 Syntax

\texttt{log file keyword}

- \texttt{file} = name of new logfile
- \texttt{keyword} = \textit{append} if output should be appended to logfile (optional)

17.70.2 Examples

\begin{verbatim}
log log.equil
log log.equil append
\end{verbatim}
17.70.3 Description

This command closes the current LAMMPS log file, opens a new file with the specified name, and begins logging information to it. If the specified file name is none, then no new log file is opened. If the optional keyword append is specified, then output will be appended to an existing log file, instead of overwriting it.

If multiple processor partitions are being used, the file name should be a variable, so that different processors do not attempt to write to the same log file.

The file “log.lammps” is the default log file for a LAMMPS run. The name of the initial log file can also be set by the -log command-line switch.

17.70.4 Restrictions

none

17.70.5 Related commands

none

17.70.6 Default

The default LAMMPS log file is named log.lammps

17.71 mass command

17.71.1 Syntax

mass I value

- I = atom type (see asterisk form below)
- value = mass

17.71.2 Examples

mass 1 1.0
mass * 62.5
mass 2* 62.5
17.71.3 Description

Set the mass for all atoms of one or more atom types. Per-type mass values can also be set in the read_data data file using the “Masses” keyword. See the units command for what mass units to use.

The I index can be specified in one of two ways. An explicit numeric value can be used, as in the first example above. Or a wild-card asterisk can be used to set the mass for multiple atom types. This takes the form “*” or “*n” or “n*” or “m*n”. If N = the number of atom types, then an asterisk with no numeric values means all types from 1 to N. A leading asterisk means all types from 1 to n (inclusive). A trailing asterisk means all types from n to N (inclusive). A middle asterisk means all types from m to n (inclusive).

A line in a data file that follows the “Masses” keyword specifies mass using the same format as the arguments of the mass command in an input script, except that no wild-card asterisk can be used. For example, under the “Masses” section of a data file, the line that corresponds to the first example above would be listed as

```
1 1.0
```

Note that the mass command can only be used if the atom style requires per-type atom mass to be set. Currently, all but the sphere and ellipsoid and peri styles do. They require mass to be set for individual particles, not types. Per-atom masses are defined in the data file read by the read_data command, or set to default values by the create_atoms command. Per-atom masses can also be set to new values by the set mass or set density commands.

Also note that pair_style eam and pair_style bop commands define the masses of atom types in their respective potential files, in which case the mass command is normally not used.

If you define a hybrid atom style which includes one (or more) sub-styles which require per-type mass and one (or more) sub-styles which require per-atom mass, then you must define both. However, in this case the per-type mass will be ignored; only the per-atom mass will be used by LAMMPS.

17.71.4 Restrictions

This command must come after the simulation box is defined by a read_data, read_restart, or create_box command. All masses must be defined before a simulation is run. They must also all be defined before a velocity or fix shake command is used.

The mass assigned to any type or atom must be > 0.0.

17.71.5 Related commands

17.72 message command

17.72.1 Syntax

```
message which protocol mode arg
```

- which = client or server or quit
- protocol = md or mc
- mode = file or zmq or mpi/one or mpi/two

- `file arg = filename`
  filename = file used for message exchanges
- `zmq arg = socket-ID`
  socket-ID for client = localhost:5555, see description below
  socket-ID for server = *:5555, see description below
- `mpi/one arg = none`
- `mpi/two arg = filename`
  filename = file used to establish communication between 2 MPI jobs

17.72.2 Examples

```
message client md file tmp.couple
message server md file tmp.couple
message client md zmq localhost:5555
message server md zmq *:5555
message client md mpi/one
message server md mpi/one
message client md mpi/two tmp.couple
message server md mpi/two tmp.couple
message quit
```

17.72.3 Description

Establish a messaging protocol between LAMMPS and another code for the purpose of client/server coupling.

The *Howto client/server* doc page gives an overview of client/server coupling of LAMMPS with another code where one code is the “client” and sends request messages to a “server” code. The server responds to each request with a reply message. This enables the two codes to work in tandem to perform a simulation.

The `which` argument defines LAMMPS to be the client or the server.

As explained below the `quit` option should be used when LAMMPS is finished as a client. It sends a message to the server to tell it to shut down.

The `protocol` argument defines the format and content of messages that will be exchanged between the two codes. The current options are:
• md = run dynamics with another code
• mc = perform Monte Carlo moves with another code

For protocol \textit{md}, LAMMPS can be either a client or server. See the \texttt{server \textit{md}} doc page for details on the protocol.

For protocol \textit{mc}, LAMMPS can be the server. See the \texttt{server \textit{mc}} doc page for details on the protocol.

The \textit{mode} argument specifies how messages are exchanged between the client and server codes. Both codes must use the same mode and use consistent parameters.

For mode \textit{file}, the 2 codes communicate via binary files. They must use the same filename, which is actually a file prefix. Several files with that prefix will be created and deleted as a simulation runs. The filename can include a path. Both codes must be able to access the path/file in a common filesystem.

For mode \textit{zmq}, the 2 codes communicate via a socket on the server code’s machine. Support for socket messaging is provided by the open-source \texttt{ZeroMQ library}, which must be installed on your system. The client specifies an IP address (IPv4 format) or the DNS name of the machine the server code is running on, followed by a 4 or 5 digit port ID for the socket, separated by a colon. E.g.

| localhost:5555 | # client and server running on same machine |
| 192.168.1.1:5555 | # server is 192.168.1.1 |
| deptbox.uni.edu:5555 | # server is deptbox.uni.edu |

The server specifies “*:5555” where “*” represents all available interfaces on the server’s machine, and the port ID must match what the client specifies.

\textbf{Note:} On Linux or Unix machines port IDs below 1024 are reserved to the superuser and thus not available. Other ports may already be in use and cannot be opened by a second process. On a Linux machine the commands “netstat -t4an” or “ss -t4an” will list all locally used port IDs for IPv4 addresses.

\textbf{Note:} On many machines (and sometimes on local networks) also ports IDs may be blocked by default through firewalls. In that case either access to the required port (or a desired range of ports) has to be selectively enabled to the firewall disabled (the latter is usually not a good idea unless you are on a (small) local network that is already protected from outside access.

\textbf{Note:} Additional explanation is needed here about how to use the \textit{zmq} mode on a parallel machine, e.g. a cluster with many nodes.

For mode \textit{mpi/one}, the 2 codes communicate via MPI and are launched by the same \texttt{mpirun} command, e.g. with this syntax for OpenMPI:

```bash
mpirun -np 2 lmp_mpi -mpicolor 0 -in in.client -log log.client : -np 4 othercode args
# LAMMPS is client
mpirun -np 2 othercode args : -np 4 lmp_mpi -mpicolor 1 -in in.server # LAMMPS is server
```

Note the use of the “-mpicolor color” command-line argument with LAMMPS. See the \texttt{command-line args} doc page for further explanation.

For mode \textit{mpi/two}, the 2 codes communicate via MPI, but are launched be 2 separate \texttt{mpirun} commands. The specified \textit{filename} argument is a file the 2 MPI processes will use to exchange info so that an MPI inter-communicator can be

\textbf{17.72. message command}
established to enable the 2 codes to send MPI messages to each other. Both codes must be able to access the path/file in a common filesystem.

Normally, the message client or message server command should be used at the top of a LAMMPS input script. It performs an initial handshake with the other code to setup messaging and to verify that both codes are using the same message protocol and mode. Assuming both codes are launched at (nearly) the same time, the other code should perform the same kind of initialization.

If LAMMPS is the client code, it will begin sending messages when a LAMMPS client command begins its operation. E.g. for the fix client/md command, it is when a run command is executed.

If LAMMPS is the server code, it will begin receiving messages when the server command is invoked.

If LAMMPS is being used as a client, the message quit command will terminate its messaging with the server. If you do not use this command and just allow LAMMPS to exit, then the server will continue to wait for further messages. This may not be a problem, but if both the client and server programs were launched in the same batch script, then if the server runs indefinitely, it may consume the full allocation of computer time, even if the calculation finishes sooner.

Note that if LAMMPS is the client or server, it will continue processing the rest of its input script after client/server communication terminates.

If both codes cooperate in this manner, a new round of client/server messaging can be initiated after termination by re-using a second message command in your LAMMPS input script, followed by a new fix client or server command, followed by another message quit command (if LAMMPS is the client). As an example, this can be performed in a loop to use a quantum code as a server to compute quantum forces for multiple LAMMPS data files or periodic snapshots while running dynamics.

### 17.72.4 Restrictions

This command is part of the MESSAGE package. It is only enabled if LAMMPS was built with that package. See the Build package doc page for more info.

### 17.72.5 Related commands

### 17.73 min_modify command

#### 17.73.1 Syntax

`min_modify keyword values ...`

- one or more keyword/value pairs may be listed
keyword = dmax or line or norm or alpha_damp or discrete_factor or...
  integrator or tmax
  dmax value = max
    max = maximum distance for line search to move (distance units)
  line value = backtrack or quadratic or forcezero or spin_cubic or spin
  none
    backtrack, quadratic, forcezero, spin_cubic, spin_none = style of...
  linesearch to use
  norm value = two or inf or max
    two = Euclidean two-norm (length of 3N vector)
    inf = max force component across all 3-vectors
    max = max force norm across all 3-vectors
  alpha_damp value = damping
    damping = fictitious Gilbert damping for spin minimization (adim)
  discrete_factor value = factor
    factor = discretization factor for adaptive spin timestep (adim)
  integrator value = eulerimplicit or verlet
    time integration scheme for fire minimization
  tmax value = factor
    factor = maximum adaptive timestep for fire minimization (adim)

17.73.2 Examples

```
min_modify dmax 0.2
min_modify integrator verlet tmax 4
```

17.73.3 Description

This command sets parameters that affect the energy minimization algorithms selected by the min_style command. The various settings may affect the convergence rate and overall number of force evaluations required by a minimization, so users can experiment with these parameters to tune their minimizations.

The cg and sd minimization styles have an outer iteration and an inner iteration which is steps along a one-dimensional line search in a particular search direction. The dmax parameter is how far any atom can move in a single line search in any dimension (x, y, or z). For the quickmin and fire minimization styles, the dmax setting is how far any atom can move in a single iteration (timestep). Thus a value of 0.1 in real units means no atom will move further than 0.1 Angstroms in a single outer iteration. This prevents highly overlapped atoms from being moved long distances (e.g. through another atom) due to large forces.

The choice of line search algorithm for the cg and sd minimization styles can be selected via the line keyword. The default quadratic line search algorithm starts out using the robust backtracking method described below. However, once the system gets close to a local minimum and the linesearch steps get small, so that the energy is approximately quadratic in the step length, it uses the estimated location of zero gradient as the linesearch step, provided the energy change is downhill. This becomes more efficient than backtracking for highly-converged relaxations. The forcezero line search algorithm is similar to quadratic. It may be more efficient than quadratic on some systems.

The backtracking search is robust and should always find a local energy minimum. However, it will “converge” when it can no longer reduce the energy of the system. Individual atom forces may still be larger than desired at this point, because the energy change is measured as the difference of two large values (energy before and energy after) and that difference may be smaller than machine epsilon even if atoms could move in the gradient direction to reduce forces further.
The choice of a norm can be modified for the min styles cg, sd, quickmin, fire, fire/old, spin, spin/cg and spin/lbfgs using the norm keyword. The default two norm computes the 2-norm (Euclidean length) of the global force vector:

\[ \| \vec{F} \|_2 = \sqrt{F_1^2 + \cdots + F_N^2} \]

The max norm computes the length of the 3-vector force for each atom (2-norm), and takes the maximum value of those across all atoms

\[ \| \vec{F} \|_{\text{max}} = \max \left( \| \vec{F}_1 \|, \cdots, \| \vec{F}_N \| \right) \]

The inf norm takes the maximum component across the forces of all atoms in the system:

\[ \| \vec{F} \|_{\text{inf}} = \max \left( |F_1^1|, |F_2^1|, |F_3^1|, \cdots, |F_1^N|, |F_2^N|, |F_3^N| \right) \]

For the min styles spin, spin/cg and spin/lbfgs, the force norm is replaced by the spin-torque norm.

Keywords alpha_damp and discrete_factor only make sense when a min_spin command is declared. Keyword alpha_damp defines an analog of a magnetic Gilbert damping. It defines a relaxation rate toward an equilibrium for a given magnetic system. Keyword discrete_factor defines a discretization factor for the adaptive timestep used in the spin minimization. See min_spin for more information about those quantities.

The choice of a line search algorithm for the spin/cg and spin/lbfgs styles can be specified via the line keyword. The spin_cubic and spin_none keywords only make sense when one of those two minimization styles is declared. The spin_cubic performs the line search based on a cubic interpolation of the energy along the search direction. The spin_none keyword deactivates the line search procedure. The spin_none is a default value for line keyword for both spin/lbfgs and spin/cg. Convergence of spin/lbfgs can be more robust if spin_cubic line search is used.

The Newton integrator used for fire minimization can be selected to be either the symplectic Euler (eulerimplicit) or velocity Verlet (verlet). tmax defines the maximum value for the adaptive timestep during a fire minimization. It is a multiplication factor applied to the current timestep (not in time unit). For example, tmax = 4.0 with a timestep of 2fs, means that the maximum value the timestep can reach during a fire minimization is 4fs. Note that parameter defaults has been chosen to be reliable in most cases, but one should consider adjusting timestep and tmax to optimize the minimization for large or complex systems. Other parameters of the fire minimization can be tuned (tmin, delaystep, dtgrow, dtshrink, alpha0, and alphashrink). Please refer to the references describing the min_style fire. An additional stopping criteria vdfmax is used by fire in order to avoid unnecessary looping when it is reasonable to think the system will not be relaxed further. Note that in this case the system will NOT have reached your minimization criteria. This could happen when the system comes to be stuck in a local basin of the phase space. vdfmax is the maximum number of consecutive iterations with P(t) < 0.

The min_style fire is an optimized implementation of min_style fire/old. It can however behave similarly to the fire/old style by using the following set of parameters:

```
min_modify  integrator eulerexplicit tmax 10.0 tmin 0.0 delaystep 5 &
            dtgrow 1.1 dtshrink 0.5 alpha0 0.1 alphashrink 0.99 &
            vdfmax 100000 halfstepback no initialdelay
```

### 17.73.4 Restrictions

For magnetic GNEB calculations, only spin_none value for line keyword can be used when minimization styles spin/cg and spin/lbfgs are employed. See neb/spin for more explanation.
17.73.5 Related commands

*min_style, minimize*

17.73.6 Default

The option defaults are dmax = 0.1, line = quadratic and norm = two.

For the *spin, spin/cg and spin/lbfgs* styles, the option defaults are alpha_damp = 1.0, discrete_factor = 10.0, line = spin_none, and norm = euclidean.

For the *fire* style, the option defaults are integrator = eulerimplicit, tmax = 10.0, tmin = 0.02, delaystep = 20, dtgrow = 1.1, dtshrink = 0.5, alpha0 = 0.25, alphashrink = 0.99, vdfmax = 2000, halfstepback = yes and initialdelay = yes.

17.74 min_style spin command

17.75 min_style spin/cg command

17.76 min_style spin/lbfgs command

17.76.1 Syntax

```
min_style  spin
min_style  spin/cg
min_style  spin/lbfgs
```

17.76.2 Examples

```
min_style  spin/lbfgs
min_modify  line  spin_cubic discrete_factor 10.0
```

17.76.3 Description

Apply a minimization algorithm to use when a *minimize* command is performed.

Style *spin* defines a damped spin dynamics with an adaptive timestep, according to:

\[
\frac{d\vec{s}_i}{dt} = \lambda \vec{s}_i \times (\vec{\omega}_i \times \vec{s}_i)
\]

with \(\lambda\) a damping coefficient (similar to a Gilbert damping). \(\lambda\) can be defined by setting the *alpha_damp* keyword with the *min_modify* command.

The minimization procedure solves this equation using an adaptive timestep. The value of this timestep is defined by the largest precession frequency that has to be solved in the system:

\[
\Delta t_{\text{max}} = \frac{2\pi}{\kappa |\vec{\omega}_{\text{max}}|}
\]
with $|\vec{\omega}_{\text{max}}|$ the norm of the largest precession frequency in the system (across all processes, and across all replicas if a spin/neb calculation is performed).

$\kappa$ defines a discretization factor $\text{discrete\_factor}$ for the definition of this timestep. $\text{discrete\_factor}$ can be defined with the $\text{min\_modify}$ command.

Style $\text{spin/cg}$ defines an orthogonal spin optimization (OSO) combined to a conjugate gradient (CG) algorithm. The $\text{min\_modify}$ command can be used to couple the $\text{spin/cg}$ to a line search procedure, and to modify the discretization factor $\text{discrete\_factor}$. By default, style $\text{spin/cg}$ does not employ the line search procedure and uses the adaptive time-step technique in the same way as style $\text{spin}$.

Style $\text{spin/lbfgs}$ defines an orthogonal spin optimization (OSO) combined to a limited-memory Broyden-Fletcher-Goldfarb-Shanno (L-BFGS) algorithm. By default, style $\text{spin/lbfgs}$ does not employ line search procedure. If the line search procedure is not used then the discret factor defines the maximum root mean squared rotation angle of spins by equation $\pi/(5*\text{Kappa})$. The default value for $\text{Kappa}$ is 10. The $\text{spin\_cubic}$ line search option can improve the convergence of the $\text{spin/lbfgs}$ algorithm.

The $\text{min\_modify}$ command can be used to activate the line search procedure, and to modify the discretization factor $\text{discrete\_factor}$.

For more information about styles $\text{spin/cg}$ and $\text{spin/lbfgs}$, see their implementation reported in (Ivanov).

**Note:** All the $\text{spin}$ styles replace the force tolerance by a torque tolerance. See $\text{minimize}$ for more explanation.

**Note:** The $\text{spin/cg}$ and $\text{spin/lbfgs}$ styles can be used for magnetic NEB calculations only if the line search procedure is deactivated. See $\text{neb/spin}$ for more explanation.

### 17.76.4 Restrictions

This minimization procedure is only applied to spin degrees of freedom for a frozen lattice configuration.

### 17.76.5 Related commands

$\text{min\_style}$, $\text{minimize}$, $\text{min\_modify}$

### 17.76.6 Default

The option defaults are $\alpha_{\text{damp}} = 1.0$, $\text{discrete\_factor} = 10.0$, $\text{line} = \text{spin\_none}$ and $\text{norm} = \text{euclidean}$.

17.77 min_style command

17.77.1 Syntax

```
min_style style
```

- style = cg or hftn or sd or quickmin or fire or fire/old or spin or spin/cg or spin/lbfgs

17.77.2 Examples

```
min_style cg
min_style spin
min_style fire
```

17.77.3 Description

Choose a minimization algorithm to use when a `minimize` command is performed.

Style `cg` is the Polak-Ribiere version of the conjugate gradient (CG) algorithm. At each iteration the force gradient is combined with the previous iteration information to compute a new search direction perpendicular (conjugate) to the previous search direction. The PR variant affects how the direction is chosen and how the CG method is restarted when it ceases to make progress. The PR variant is thought to be the most effective CG choice for most problems.

Style `hftn` is a Hessian-free truncated Newton algorithm. At each iteration a quadratic model of the energy potential is solved by a conjugate gradient inner iteration. The Hessian (second derivatives) of the energy is not formed directly, but approximated in each conjugate search direction by a finite difference directional derivative. When close to an energy minimum, the algorithm behaves like a Newton method and exhibits a quadratic convergence rate to high accuracy. In most cases the behavior of hftn is similar to cg, but it offers an alternative if cg seems to perform poorly. This style is not affected by the `min_modify` command.

Style `sd` is a steepest descent algorithm. At each iteration, the search direction is set to the downhill direction corresponding to the force vector (negative gradient of energy). Typically, steepest descent will not converge as quickly as CG, but may be more robust in some situations.

Style `quickmin` is a damped dynamics method described in (Sheppard), where the damping parameter is related to the projection of the velocity vector along the current force vector for each atom. The velocity of each atom is initialized to 0.0 by this style, at the beginning of a minimization.

Style `fire` is a damped dynamics method described in (Bitzek), which is similar to quickmin but adds a variable timestep and alters the projection operation to maintain components of the velocity non-parallel to the current force vector. The velocity of each atom is initialized to 0.0 by this style, at the beginning of a minimization. This style correspond to an optimized version described in (Guenole) that include different time integration schemes and defaults parameters. The default parameters can be modified with the command `min_modify`.

Style `fire/old` is the original implementation of fire in Lammmps, conserved for backward compatibility. The main differences regarding the current version `fire` are: time integration by Explicit Euler only, different sequence in maintaining velocity components non-parallel to the current force vector and hard-coded minimization parameters. A complete description of the differences between fire/old and fire can be found in (Guenole) (where the current fire in LAMMPS is called fire2.0). By using an appropriate set of parameters, fire can behave similar to fire/old, as described in the `min_modify` command.

Style `spin` is a damped spin dynamics with an adaptive timestep.

Style `spin/cg` uses an orthogonal spin optimization (OSO) combined to a conjugate gradient (CG) approach to minimize spin configurations.
Style spin/lbfgs uses an orthogonal spin optimization (OSO) combined to a limited-memory Broyden-Fletcher-Goldfarb-Shanno (LBFGS) approach to minimize spin configurations.

See the min/spin doc page for more information about the spin, spin/cg and spin/lbfgs styles.

Either the quickmin, fire and fire/old styles are useful in the context of nudged elastic band (NEB) calculations via the neb command.

Either the spin, spin/cg and spin/lbfgs styles are useful in the context of magnetic geodesic nudged elastic band (GNEB) calculations via the neb/spin command.

**Note:** The damped dynamic minimizers use whatever timestep you have defined via the timestep command. Often they will converge more quickly if you use a timestep about 10x larger than you would normally use for dynamics simulations. For fire, the default timestep is recommended to be equal to the one you would normally use for dynamics simulations.

**Note:** The quickmin, fire, fire/old, hftn, and cg/kk styles do not yet support the use of the fix box/relax command or minimizations involving the electron radius in eFF models.

Styles with a gpu, intel, kk, omp, or opt suffix are functionally the same as the corresponding style without the suffix. They have been optimized to run faster, depending on your available hardware, as discussed on the Speed packages doc page. The accelerated styles take the same arguments and should produce the same results, except for round-off and precision issues.

These accelerated styles are part of the GPU, USER-INTEL, KOKKOS, USER-OMP and OPT packages, respectively. They are only enabled if LAMMPS was built with those packages. See the Build package doc page for more info.

You can specify the accelerated styles explicitly in your input script by including their suffix, or you can use the -suffix command-line switch when you invoke LAMMPS, or you can use the suffix command in your input script.

See the Speed packages doc page for more instructions on how to use the accelerated styles effectively.

### 17.77.4 Restrictions

(Bitzek) Bitzek, Koskinen, Gahler, Moseler, Gumbsch, Phys Rev Lett, 97, 170201 (2006).

17.78 minimize command

17.79 minimize/kk command

17.79.1 Syntax

```plaintext
minimize etol ftol maxiter maxeval
```

- **etol** = stopping tolerance for energy (unitless)
- **ftol** = stopping tolerance for force (force units)
- **maxiter** = max iterations of minimizer
- **maxeval** = max number of force/energy evaluations

17.79.2 Examples

```plaintext
minimize 1.0e-4 1.0e-6 100 1000
minimize 0.0 1.0e-8 1000 100000
```

17.79.3 Description

Perform an energy minimization of the system, by iteratively adjusting atom coordinates. Iterations are terminated when one of the stopping criteria is satisfied. At that point the configuration will hopefully be in local potential energy minimum. More precisely, the configuration should approximate a critical point for the objective function (see below), which may or may not be a local minimum.

The minimization algorithm used is set by the `min_style` command. Other options are set by the `min_modify` command. Minimize commands can be interspersed with `run` commands to alternate between relaxation and dynamics. The minimizers bound the distance atoms move in one iteration, so that you can relax systems with highly overlapped atoms (large energies and forces) by pushing the atoms off of each other.

Alternate means of relaxing a system are to run dynamics with a small or limited timestep. Or dynamics can be run using `fix viscous` to impose a damping force that slowly drains all kinetic energy from the system. The `pair_style soft` potential can be used to un-overlap atoms while running dynamics.

Note that you can minimize some atoms in the system while holding the coordinates of other atoms fixed by applying `fix setforce` to the other atoms. See a fuller discussion of using fixes while minimizing below.

The minimization styles `cg`, `sd`, and `hftn` involves an outer iteration loop which sets the search direction along which atom coordinates are changed. An inner iteration is then performed using a line search algorithm. The line search typically evaluates forces and energies several times to set new coordinates. Currently, a backtracking algorithm is used which may not be optimal in terms of the number of force evaluations performed, but appears to be more robust than previous line searches we have tried. The backtracking method is described in Nocedal and Wright’s Numerical Optimization (Procedure 3.1 on p 41).

The minimization styles `quickmin`, `fire` and `fire/old` perform damped dynamics using an Euler integration step. Thus they require a `timestep` be defined.

**Note:** The damped dynamic minimizers use whatever timestep you have defined via the `timestep` command. Often they will converge more quickly if you use a timestep about 10x larger than you would normally use for dynamics.
In all cases, the objective function being minimized is the total potential energy of the system as a function of the N atom coordinates:

\[ E(r_1, r_2, \ldots, r_N) = \sum_{i,j} E_{\text{pair}}(r_i, r_j) + \sum_{ij} E_{\text{bond}}(r_i, r_j) + \sum_{ijk} E_{\text{angle}}(r_i, r_j, r_k) + \sum_{ijkl} E_{\text{dihedral}}(r_i, r_j, r_k, r_l) + \sum_{i} E_{\text{fix}}(r_i) \]

where the first term is the sum of all non-bonded pairwise interactions including long-range Coulombic interactions, the second through fifth terms are bond, angle, dihedral, and improper interactions respectively, and the last term is energy due to fixes which can act as constraints or apply force to atoms, such as through interaction with a wall. See the discussion below about how fix commands affect minimization.

The starting point for the minimization is the current configuration of the atoms.

The minimization procedure stops if any of several criteria are met:

- the change in energy between outer iterations is less than \( etol \)
- the 2-norm (length) of the global force vector is less than the \( ftol \)
- the line search fails because the step distance backtracks to 0.0
- the number of outer iterations or timesteps exceeds \( maxiter \)
- the number of total force evaluations exceeds \( maxeval \)

\textbf{Note:} the minimization style \textit{spin}, \textit{spin/cg}, and \textit{spin/lbfgs} replace the force tolerance \( ftol \) by a torque tolerance. The minimization procedure stops if the 2-norm (length) of the torque vector on atom (defined as the cross product between the atomic spin and its precession vectors omega) is less than \( ftol \), or if any of the other criteria are met. Torque have the same units as the energy.

\textbf{Note:} You can also use the \textit{fix halt} command to specify a general criterion for exiting a minimization, that is a calculation performed on the state of the current system, as defined by an \textit{equal-style variable}.

For the first criterion, the specified energy tolerance \( etol \) is unitless; it is met when the energy change between successive iterations divided by the energy magnitude is less than or equal to the tolerance. For example, a setting of 1.0e-4 for \( etol \) means an energy tolerance of one part in 10^4. For the damped dynamics minimizers this check is not performed for a few steps after velocities are reset to 0, otherwise the minimizer would prematurely converge.

For the second criterion, the specified force tolerance \( ftol \) is in force units, since it is the length of the global force vector for all atoms, e.g. a vector of size 3N for N atoms. Since many of the components will be near zero after minimization, you can think of \( ftol \) as an upper bound on the final force on any component of any atom. For example, a setting of 1.0e-4 for \( ftol \) means no x, y, or z component of force on any atom will be larger than 1.0e-4 (in force units) after minimization.

Either or both of the \( etol \) and \( ftol \) values can be set to 0.0, in which case some other criterion will terminate the minimization.

During a minimization, the outer iteration count is treated as a timestep. Output is triggered by this timestep, e.g. thermodynamic output or dump and restart files.
Using the *thermo_style custom* command with the *fmax* or *fnorm* keywords can be useful for monitoring the progress of the minimization. Note that these outputs will be calculated only from forces on the atoms, and will not include any extra degrees of freedom, such as from the *fix box/relax* command.

Following minimization, a statistical summary is printed that lists which convergence criterion caused the minimizer to stop, as well as information about the energy, force, final line search, and iteration counts. An example is as follows:

```
Minimization stats:
    Stopping criterion = max iterations
    Energy initial, next-to-last, final = 0.626828169302 -2.82642039062 -2.82643549739
    Force two-norm initial, final = 2052.1 91.9642
    Force max component initial, final = 346.048 9.78056
    Final line search alpha, max atom move = 2.23899e-06 2.18986e-05
    Iterations, force evaluations = 2000 12724
```

The 3 energy values are for before and after the minimization and on the next-to-last iteration. This is what the *etol* parameter checks.

The two-norm force values are the length of the global force vector before and after minimization. This is what the *ftol* parameter checks.

The max-component force values are the absolute value of the largest component (x,y,z) in the global force vector, i.e. the infinity-norm of the force vector.

The alpha parameter for the line-search, when multiplied by the max force component (on the last iteration), gives the max distance any atom moved during the last iteration. Alpha will be 0.0 if the line search could not reduce the energy. Even if alpha is non-zero, if the “max atom move” distance is tiny compared to typical atom coordinates, then it is possible the last iteration effectively caused no atom movement and thus the evaluated energy did not change and the minimizer terminated. Said another way, even with non-zero forces, it’s possible the effect of those forces is to move atoms a distance less than machine precision, so that the energy cannot be further reduced.

The iterations and force evaluation values are what is checked by the *maxiter* and *maxeval* parameters.

---

**Note:** There are several force fields in LAMMPS which have discontinuities or other approximations which may prevent you from performing an energy minimization to high tolerances. For example, you should use a *pair style* that goes to 0.0 at the cutoff distance when performing minimization (even if you later change it when running dynamics). If you do not do this, the total energy of the system will have discontinuities when the relative distance between any pair of atoms changes from cutoff+epsilon to cutoff-epsilon and the minimizer may behave poorly. Some of the many-body potentials use splines and other internal cutoffs that inherently have this problem. The *long-range Coulombic styles* (PPPM, Ewald) are approximate to within the user-specified tolerance, which means their energy and forces may not agree to a higher precision than the Kspace-specified tolerance. In all these cases, the minimizer may give up and stop before finding a minimum to the specified energy or force tolerance.

Note that a cutoff Lennard-Jones potential (and others) can be shifted so that its energy is 0.0 at the cutoff via the *pair_modify* command. See the doc pages for individual *pair styles* for details. Note that Coulombic potentials always have a cutoff, unless versions with a long-range component are used (e.g. *pair_style lj/cut/coul/long*). The CHARMM potentials go to 0.0 at the cutoff (e.g. *pair_style lj/charmm/coul/charmm*), as do the GROMACS potentials (e.g. *pair_style lj/gromacs*).

If a soft potential (*pair_style soft*) is used the Astop value is used for the prefactor (no time dependence).

The *fix box/relax* command can be used to apply an external pressure to the simulation box and allow it to shrink/expand during the minimization.

Only a few other fixes (typically those that add forces) are invoked during minimization. See the doc pages for individual *fix* commands to see which ones are relevant. Current examples of fixes that can be used include:

---

**17.79. minimize/kk command**
LAMMPS Documentation

- fix addforce
- fix addtorque
- fix efield
- fix enforce2d
- fix indent
- fix lineforce
- fix planeforce
- fix setforce
- fix spring
- fix spring/self
- fix viscous
- fix wall
- fix wall/region

**Note:** Some fixes which are invoked during minimization have an associated potential energy. For that energy to be included in the total potential energy of the system (the quantity being minimized), you MUST enable the `fix_modify energy` option for that fix. The doc pages for individual `fix` commands specify if this should be done.

**Note:** The minimizers in LAMMPS do not allow for bonds (or angles, etc) to be held fixed while atom coordinates are being relaxed, e.g. via `fix shake` or `fix rigid`. See more info in the Restrictions section below.

Styles with a `gpu`, `intel`, `kk`, `omp`, or `opt` suffix are functionally the same as the corresponding style without the suffix. They have been optimized to run faster, depending on your available hardware, as discussed on the Speed packages doc page. The accelerated styles take the same arguments and should produce the same results, except for round-off and precision issues.

These accelerated styles are part of the GPU, USER-INTEL, KOKKOS, USER-OMP and OPT packages, respectively. They are only enabled if LAMMPS was built with those packages. See the Build package doc page for more info.

You can specify the accelerated styles explicitly in your input script by including their suffix, or you can use the `-suffix command-line switch when you invoke LAMMPS, or you can use the `suffix` command in your input script.

See the Speed packages doc page for more instructions on how to use the accelerated styles effectively.
17.79.4 Restrictions

Features that are not yet implemented are listed here, in case someone knows how they could be coded:

It is an error to use fix shake with minimization because it turns off bonds that should be included in the potential energy of the system. The effect of a fix shake can be approximated during a minimization by using stiff spring constants for the bonds and/or angles that would normally be constrained by the SHAKE algorithm.

Fix rigid is also not supported by minimization. It is not an error to have it defined, but the energy minimization will not keep the defined body(s) rigid during the minimization. Note that if bonds, angles, etc internal to a rigid body have been turned off (e.g. via neigh_modify exclude), they will not contribute to the potential energy which is probably not what is desired.

Pair potentials that produce torque on a particle (e.g. granular potentials or the GayBerne potential for ellipsoidal particles) are not relaxed by a minimization. More specifically, radial relaxations are induced, but no rotations are induced by a minimization, so such a system will not fully relax.

17.80.3 Description

Define a molecule template that can be used as part of other LAMMPS commands, typically to define a collection of particles as a bonded molecule or a rigid body. Commands that currently use molecule templates include:

- fix deposit
- fix pour
- fix rigid/small
- fix shake
- fix gcmc
- fix bond/react
- create_atoms
- atom_style template

The ID of a molecule template can only contain alphanumeric characters and underscores.

A single template can contain multiple molecules, listed one per file. Some of the commands listed above currently use only the first molecule in the template, and will issue a warning if the template contains multiple molecules. The `atom_style template` command allows multiple-molecule templates to define a system with more than one templated molecule.

Each filename can be followed by optional keywords which are applied only to the molecule in the file as used in this template. This is to make it easy to use the same molecule file in different molecule templates or in different simulations. You can specify the same file multiple times with different optional keywords.

The `offset`, `toff`, `aoff`, `doff`, `ioff` keywords add the specified offset values to the atom types, bond types, angle types, dihedral types, and/or improper types as they are read from the molecule file. E.g. if `toff = 2`, and the file uses atom types 1,2,3, then each created molecule will have atom types 3,4,5. For the `offset` keyword, all five offset values must be specified, but individual values will be ignored if the molecule template does not use that attribute (e.g. no bonds).

The `scale` keyword scales the size of the molecule. This can be useful for modeling polydisperse granular rigid bodies. The scale factor is applied to each of these properties in the molecule file, if they are defined: the individual particle coordinates (Coords section), the individual mass of each particle (Masses section), the individual diameters of each particle (Diameters section), the total mass of the molecule (header keyword = mass), the center-of-mass of the molecule (header keyword = com), and the moments of inertia of the molecule (header keyword = inertia).

Note: The molecule command can be used to define molecules with bonds, angles, dihedrals, impropers, or special bond lists of neighbors within a molecular topology, so that you can later add the molecules to your simulation, via
one or more of the commands listed above. Since this topology-related information requires that suitable storage is reserved when LAMMPS creates the simulation box (e.g. when using the `create_box` command or the `read_data` command) suitable space has to be reserved so you do not overflow those pre-allocated data structures when adding molecules later. Both the `create_box` command and the `read_data` command have “extra” options which insure space is allocated for storing topology info for molecules that are added later.

The format of an individual molecule file is similar but (not identical) to the data file read by the `read_data` commands, and is as follows.

A molecule file has a header and a body. The header appears first. The first line of the header is always skipped; it typically contains a description of the file. Then lines are read one at a time. Lines can have a trailing comment starting with ‘#’ that is ignored. If the line is blank (only white-space after comment is deleted), it is skipped. If the line contains a header keyword, the corresponding value(s) is read from the line. If it does not contain a header keyword, the line begins the body of the file.

The body of the file contains zero or more sections. The first line of a section has only a keyword. The next line is skipped. The remaining lines of the section contain values. The number of lines depends on the section keyword as described below. Zero or more blank lines can be used between sections. Sections can appear in any order, with a few exceptions as noted below.

These are the recognized header keywords. Header lines can come in any order. The numeric value(s) are read from the beginning of the line. The keyword should appear at the end of the line. All these settings have default values, as explained below. A line need only appear if the value(s) are different than the default.

- **N atoms** = # of atoms N in molecule, default = 0
- **Nb bonds** = # of bonds Nb in molecule, default = 0
- **Na angles** = # of angles Na in molecule, default = 0
- **Nd dihedrals** = # of dihedrals Nd in molecule, default = 0
- **Ni impropers** = # of impropers Ni in molecule, default = 0
- **Nf fragments** = # of fragments in molecule, default = 0
- **Mtotal mass** = total mass of molecule
- **Xc Yc Zc com** = coordinates of center-of-mass of molecule
- **Ixx Iyy Izz Ixy Ixz Iyz inertia** = 6 components of inertia tensor of molecule

For `mass`, `com`, and `inertia`, the default is for LAMMPS to calculate this quantity itself if needed, assuming the molecules consists of a set of point particles or finite-size particles (with a non-zero diameter) that do not overlap. If finite-size particles in the molecule do overlap, LAMMPS will not account for the overlap effects when calculating any of these 3 quantities, so you should pre-compute them yourself and list the values in the file.

The mass and center-of-mass coordinates (Xc,Yc,Zc) are self-explanatory. The 6 moments of inertia (Ixx, Iyy, Izz, Ixy, Ixz, Iyz) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

These are the allowed section keywords for the body of the file.

- **Coords, Types, Molecules, Fragments, Charges, Diameters, Masses** = atom-property sections
- **Bonds, Angles, Dihedrals, Impropers** = molecular topology sections
- **Special Bond Counts, Special Bonds** = special neighbor info
- **Shake Flags, Shake Atoms, Shake Bond Types** = SHAKE info
If a Bonds section is specified then the Special Bond Counts and Special Bonds sections can also be used, if desired, to explicitly list the 1-2, 1-3, 1-4 neighbors within the molecule topology (see details below). This is optional since if these sections are not included, LAMMPS will auto-generate this information. Note that LAMMPS uses this info to properly exclude or weight bonded pairwise interactions between bonded atoms. See the special_bonds command for more details. One reason to list the special bond info explicitly is for the thermalized Drude oscillator model which treats the bonds between nuclear cores and Drude electrons in a different manner.

**Note:** Whether a section is required depends on how the molecule template is used by other LAMMPS commands. For example, to add a molecule via the fix deposit command, the Coords and Types sections are required. To add a rigid body via the fix pour command, the Bonds (Angles, etc) sections are not required, since the molecule will be treated as a rigid body. Some sections are optional. For example, the fix pour command can be used to add “molecules” which are clusters of finite-size granular particles. If the Diameters section is not specified, each particle in the molecule will have a default diameter of 1.0. See the doc pages for LAMMPS commands that use molecule templates for more details.

Each section is listed below in alphabetic order. The format of each section is described including the number of lines it must contain and rules (if any) for whether it can appear in the data file. In each case the ID is ignored; it is simply included for readability, and should be a number from 1 to Nlines for the section, indicating which atom (or bond, etc) the entry applies to. The lines are assumed to be listed in order from 1 to Nlines, but LAMMPS does not check for this.

**Coords section:**
- one line per atom
- line syntax: ID x y z
- x,y,z = coordinate of atom

**Types section:**
- one line per atom
- line syntax: ID type
- type = atom type of atom

**Molecules section:**
- one line per atom
- line syntax: ID molecule-ID
- molecule-ID = molecule ID of atom

**Fragments section:**
- one line per fragment
- line syntax: ID a b c d . . .
- a,b,c,d,... = IDs of atoms in fragment
The ID of a fragment can only contain alphanumeric characters and underscores. The atom IDs should be values from 1 to Natoms, where Natoms = # of atoms in the molecule.

**Charges** section:
- one line per atom
- line syntax: ID q
- q = charge on atom

This section is only allowed for atom styles that support charge. If this section is not included, the default charge on each atom in the molecule is 0.0.

**Diameters** section:
- one line per atom
- line syntax: ID diam
- diam = diameter of atom

This section is only allowed for atom styles that support finite-size spherical particles, e.g. atom_style sphere. If not listed, the default diameter of each atom in the molecule is 1.0.

**Masses** section:
- one line per atom
- line syntax: ID mass
- mass = mass of atom

This section is only allowed for atom styles that support per-atom mass, as opposed to per-type mass. See the mass command for details. If this section is not included, the default mass for each atom is derived from its volume (see Diameters section) and a default density of 1.0, in units of mass/volume.

**Bonds** section:
- one line per bond
- line syntax: ID type atom1 atom2
- type = bond type (1-Nbondtype)
- atom1,atom2 = IDs of atoms in bond

The IDs for the two atoms in each bond should be values from 1 to Natoms, where Natoms = # of atoms in the molecule.

**Angles** section:
- one line per angle
- line syntax: ID type atom1 atom2 atom3
- type = angle type (1-Nangletype)
- atom1,atom2,atom3 = IDs of atoms in angle
The IDs for the three atoms in each angle should be values from 1 to N\text{atoms}, where N\text{atoms} = \# of atoms in the molecule. The 3 atoms are ordered linearly within the angle. Thus the central atom (around which the angle is computed) is the atom2 in the list.

**Dihedrals section:**
- one line per dihedral
- line syntax: ID type atom1 atom2 atom3 atom4
- type = dihedral type (1-N\text{dihedraltype})
- atom1,atom2,atom3,atom4 = IDs of atoms in dihedral

The IDs for the four atoms in each dihedral should be values from 1 to N\text{atoms}, where N\text{atoms} = \# of atoms in the molecule. The 4 atoms are ordered linearly within the dihedral.

**Improper section:**
- one line per improper
- line syntax: ID type atom1 atom2 atom3 atom4
- type = improper type (1-N\text{impropertype})
- atom1,atom2,atom3,atom4 = IDs of atoms in improper

The IDs for the four atoms in each improper should be values from 1 to N\text{atoms}, where N\text{atoms} = \# of atoms in the molecule. The ordering of the 4 atoms determines the definition of the improper angle used in the formula for the defined improper style. See the doc pages for individual styles for details.

**Special Bond Counts section:**
- one line per atom
- line syntax: ID N1 N2 N3
- N1 = \# of 1-2 bonds
- N2 = \# of 1-3 bonds
- N3 = \# of 1-4 bonds

N1, N2, N3 are the number of 1-2, 1-3, 1-4 neighbors respectively of this atom within the topology of the molecule. See the special_bonds doc page for more discussion of 1-2, 1-3, 1-4 neighbors. If this section appears, the Special Bonds section must also appear.

As explained above, LAMMPS will auto-generate this information if this section is not specified. If specified, this section will override what would be auto-generated.

**Special Bonds section:**
- one line per atom
- line syntax: ID a b c d . . .
- a,b,c,d,... = IDs of atoms in N1+N2+N3 special bonds
A, b, c, d, etc are the IDs of the n1+n2+n3 atoms that are 1-2, 1-3, 1-4 neighbors of this atom. The IDs should be values from 1 to Natoms, where Natoms = # of atoms in the molecule. The first N1 values should be the 1-2 neighbors, the next N2 should be the 1-3 neighbors, the last N3 should be the 1-4 neighbors. No atom ID should appear more than once. See the special_bonds doc page for more discussion of 1-2, 1-3, 1-4 neighbors. If this section appears, the Special Bond Counts section must also appear.

As explained above, LAMMPS will auto-generate this information if this section is not specified. If specified, this section will override what would be auto-generated.

**Shake Flags section:**
- one line per atom
- line syntax: ID flag
- flag = 0,1,2,3,4

This section is only needed when molecules created using the template will be constrained by SHAKE via the “fix shake” command. The other two Shake sections must also appear in the file, following this one.

The meaning of the flag for each atom is as follows. See the fix shake doc page for a further description of SHAKE clusters.
- 0 = not part of a SHAKE cluster
- 1 = part of a SHAKE angle cluster (two bonds and the angle they form)
- 2 = part of a 2-atom SHAKE cluster with a single bond
- 3 = part of a 3-atom SHAKE cluster with two bonds
- 4 = part of a 4-atom SHAKE cluster with three bonds

**Shake Atoms section:**
- one line per atom
- line syntax: ID a b c d
- a,b,c,d = IDs of atoms in cluster

This section is only needed when molecules created using the template will be constrained by SHAKE via the “fix shake” command. The other two Shake sections must also appear in the file.

The a,b,c,d values are atom IDs (from 1 to Natoms) for all the atoms in the SHAKE cluster that this atom belongs to. The number of values that must appear is determined by the shake flag for the atom (see the Shake Flags section above). All atoms in a particular cluster should list their a,b,c,d values identically.

If flag = 0, no a,b,c,d values are listed on the line, just the (ignored) ID.

If flag = 1, a,b,c are listed, where a = ID of central atom in the angle, and b,c the other two atoms in the angle.

If flag = 2, a,b are listed, where a = ID of atom in bond with the lowest ID, and b = ID of atom in bond with the highest ID.

If flag = 3, a,b,c are listed, where a = ID of central atom, and b,c = IDs of other two atoms bonded to the central atom.

If flag = 4, a,b,c,d are listed, where a = ID of central atom, and b,c,d = IDs of other three atoms bonded to the central atom.

See the fix shake doc page for a further description of SHAKE clusters.

**Shake Bond Types section:**
• one line per atom
• line syntax: ID a b c
• a,b,c = bond types (or angle type) of bonds (or angle) in cluster

This section is only needed when molecules created using the template will be constrained by SHAKE via the “fix shake” command. The other two Shake sections must also appear in the file.

The a,b,c values are bond types (from 1 to Nbondtypes) for all bonds in the SHAKE cluster that this atom belongs to. The number of values that must appear is determined by the shake flag for the atom (see the Shake Flags section above). All atoms in a particular cluster should list their a,b,c values identically.

If flag = 0, no a,b,c values are listed on the line, just the (ignored) ID.

If flag = 1, a,b,c are listed, where a = bondtype of the bond between the central atom and the first non-central atom (value b in the Shake Atoms section), b = bondtype of the bond between the central atom and the second non-central atom (value c in the Shake Atoms section), and c = the angle type (1 to Nangletypes) of the angle between the 3 atoms.

If flag = 2, only a is listed, where a = bondtype of the bond between the 2 atoms in the cluster.

If flag = 3, a,b are listed, where a = bondtype of the bond between the central atom and the first non-central atom (value b in the Shake Atoms section), and b = bondtype of the bond between the central atom and the second non-central atom (value c in the Shake Atoms section).

If flag = 4, a,b,c are listed, where a = bondtype of the bond between the central atom and the first non-central atom (value b in the Shake Atoms section), b = bondtype of the bond between the central atom and the second non-central atom (value c in the Shake Atoms section), and c = bondtype of the bond between the central atom and the third non-central atom (value d in the Shake Atoms section).

See the fix shake doc page for a further description of SHAKE clusters.

```

17.81.3 Description

Perform a nudged elastic band (NEB) calculation using multiple replicas of a system. Two or more replicas must be used; the first and last are the end points of the transition path.

NEB is a method for finding both the atomic configurations and height of the energy barrier associated with a transition state, e.g. for an atom to perform a diffusive hop from one energy basin to another in a coordinated fashion with its neighbors. The implementation in LAMMPS follows the discussion in these 4 papers: (HenkelmanA), (HenkelmanB), (Nakano) and (Maras).

Each replica runs on a partition of one or more processors. Processor partitions are defined at run-time using the

\[ \text{-partition command-line switch} \]

Note that if you have MPI installed, you can run a multi-replica simulation with more replicas (partitions) than you have physical processors, e.g you can run a 10-replica simulation on just one or two processors. You will simply not get the performance speed-up you would see with one or more physical processors per replica. See the Howto replica doc page for further discussion.

Note: As explained below, a NEB calculation performs a damped dynamics minimization across all the replicas. The minimizer uses whatever timestep you have defined in your input script, via the timestep command. Often NEB will converge more quickly if you use a timestep about 10x larger than you would normally use for dynamics simulations.

When a NEB calculation is performed, it is assumed that each replica is running the same system, though LAMMPS does not check for this. I.e. the simulation domain, the number of atoms, the interaction potentials, and the starting configuration when the neb command is issued should be the same for every replica.

In a NEB calculation each replica is connected to other replicas by inter-replica nudging forces. These forces are imposed by the fix neb command, which must be used in conjunction with the neb command. The group used to define the fix neb command defines the NEB atoms which are the only ones that inter-replica springs are applied to. If the group does not include all atoms, then non-NEB atoms have no inter-replica springs and the forces they feel and their motion is computed in the usual way due only to other atoms within their replica. Conceptually, the non-NEB atoms
provide a background force field for the NEB atoms. They can be allowed to move during the NEB minimization procedure (which will typically induce different coordinates for non-NEB atoms in different replicas), or held fixed using other LAMMPS commands such as fix setforce. Note that the partition command can be used to invoke a command on a subset of the replicas, e.g. if you wish to hold NEB or non-NEB atoms fixed in only the end-point replicas.

The initial atomic configuration for each of the replicas can be specified in different manners via the file-style setting, as discussed below. Only atoms whose initial coordinates should differ from the current configuration need be specified. Conceptually, the initial and final configurations for the first replica should be states on either side of an energy barrier. As explained below, the initial configurations of intermediate replicas can be atomic coordinates interpolated in a linear fashion between the first and last replicas. This is often adequate for simple transitions. For more complex transitions, it may lead to slow convergence or even bad results if the minimum energy path (MEP, see below) of states over the barrier cannot be correctly converged to from such an initial path. In this case, you will want to generate initial states for the intermediate replicas that are geometrically closer to the MEP and read them in.

For a file-style setting of final, a filename is specified which contains atomic coordinates for zero or more atoms, in the format described below. For each atom that appears in the file, the new coordinates are assigned to that atom in the final replica. Each intermediate replica also assigns a new position to that atom in an interpolated manner. This is done by using the current position of the atom as the starting point and the read-in position as the final point. The distance between them is calculated, and the new position is assigned to be a fraction of the distance. E.g. if there are 10 replicas, the second replica will assign a position that is 10% of the distance along a line between the starting and final point, and the 9th replica will assign a position that is 90% of the distance along the line. Note that for this procedure to produce consistent coordinates across all the replicas, the current coordinates need to be the same in all replicas. LAMMPS does not check for this, but invalid initial configurations will likely result if it is not the case.

Note: The “distance” between the starting and final point is calculated in a minimum-image sense for a periodic simulation box. This means that if the two positions are on opposite sides of a box (periodic in that dimension), the distance between them will be small, because the periodic image of one of the atoms is close to the other. Similarly, even if the assigned position resulting from the interpolation is outside the periodic box, the atom will be wrapped back into the box when the NEB calculation begins.

For a file-style setting of each, a filename is specified which is assumed to be unique to each replica. This can be done by using a variable in the filename, e.g.

```
variable i equal part
neb 0.0 0.001 1000 500 50 each coords.initial.$i
```

which in this case will substitute the partition ID (0 to N-1) for the variable I, which is also effectively the replica ID. See the variable command for other options, such as using world-, universe-, or uloop-style variables.

Each replica (except the first replica) will read its file, formatted as described below, and for any atom that appears in the file, assign the specified coordinates to its atom. The various files do not need to contain the same set of atoms.

For a file-style setting of none, no filename is specified. Each replica is assumed to already be in its initial configuration at the time the neb command is issued. This allows each replica to define its own configuration by reading a replica-specific data or restart or dump file, via the read_data, read_restart, or read_dump commands. The replica-specific names of these files can be specified as in the discussion above for the each file-style. Also see the section below for how a NEB calculation can produce restart files, so that a long calculation can be restarted if needed.

Note: None of the file-style settings change the initial configuration of any atom in the first replica. The first replica must thus be in the correct initial configuration at the time the neb command is issued.
A NEB calculation proceeds in two stages, each of which is a minimization procedure, performed via damped dynamics. To enable this, you must first define a damped dynamics min_style, such as quickmin or fire. The cg, sd, and hftn styles cannot be used, since they perform iterative line searches in their inner loop, which cannot be easily synchronized across multiple replicas.

The minimizer tolerances for energy and force are set by etol and ftol, the same as for the minimize command. A non-zero etol means that the NEB calculation will terminate if the energy criterion is met by every replica. The energies being compared to etol do not include any contribution from the inter-replica nudging forces, since these are non-conservative. A non-zero ftol means that the NEB calculation will terminate if the force criterion is met by every replica. The forces being compared to ftol include the inter-replica nudging forces.

The maximum number of iterations in each stage is set by N1 and N2. These are effectively timestep counts since each iteration of damped dynamics is like a single timestep in a dynamics run. During both stages, the potential energy of each replica and its normalized distance along the reaction path (reaction coordinate RD) will be printed to the screen and log file every Nevery timesteps. The RD is 0 and 1 for the first and last replica. For intermediate replicas, it is the cumulative distance (normalized by the total cumulative distance) between adjacent replicas, where “distance” is defined as the length of the 3N-vector of differences in atomic coordinates, where N is the number of NEB atoms involved in the transition. These outputs allow you to monitor NEB’s progress in finding a good energy barrier. N1 and N2 must both be multiples of Nevery.

In the first stage of NEB, the set of replicas should converge toward a minimum energy path (MEP) of conformational states that transition over a barrier. The MEP for a transition is defined as a sequence of 3N-dimensional states, each of which has a potential energy gradient parallel to the MEP itself. The configuration of highest energy along a MEP corresponds to a saddle point. The replica states will also be roughly equally spaced along the MEP due to the inter-replica nudging force added by the fix neb command.

In the second stage of NEB, the replica with the highest energy is selected and the inter-replica forces on it are converted to a force that drives its atom coordinates to the top or saddle point of the barrier, via the barrier-climbing calculation described in (HenkelmanB). As before, the other replicas rearrange themselves along the MEP so as to be roughly equally spaced.

When both stages are complete, if the NEB calculation was successful, the configurations of the replicas should be along (close to) the MEP and the replica with the highest energy should be an atomic configuration at (close to) the saddle point of the transition. The potential energies for the set of replicas represents the energy profile of the transition along the MEP.

A few other settings in your input script are required or advised to perform a NEB calculation. See the NOTE about the choice of timestep at the beginning of this doc page.

An atom map must be defined which it is not by default for atom_style atomic problems. The atom_modify map command can be used to do this.

The minimizers in LAMMPS operate on all atoms in your system, even non-NEB atoms, as defined above. To prevent non-NEB atoms from moving during the minimization, you should use the fix setforce command to set the force on each of those atoms to 0.0. This is not required, and may not even be desired in some cases, but if those atoms move too far (e.g. because the initial state of your system was not well-minimized), it can cause problems for the NEB procedure.

The damped dynamics minimizers, such as quickmin and fire), adjust the position and velocity of the atoms via an Euler integration step. Thus you must define an appropriate timestep to use with NEB. As mentioned above, NEB will often converge more quickly if you use a timestep about 10x larger than you would normally use for dynamics simulations.
Each file read by the neb command containing atomic coordinates used to initialize one or more replicas must be formatted as follows.

The file can be ASCII text or a gzipped text file (detected by a .gz suffix). The file can contain initial blank lines or comment lines starting with “#” which are ignored. The first non-blank, non-comment line should list N = the number of lines to follow. The N successive lines contain the following information:

```
ID1  x1  y1  z1
ID2  x2  y2  z2
... 
IDN xN yN zN
```

The fields are the atom ID, followed by the x,y,z coordinates. The lines can be listed in any order. Additional trailing information on the line is OK, such as a comment.

Note that for a typical NEB calculation you do not need to specify initial coordinates for very many atoms to produce differing starting and final replicas whose intermediate replicas will converge to the energy barrier. Typically only new coordinates for atoms geometrically near the barrier need be specified.

Also note there is no requirement that the atoms in the file correspond to the NEB atoms in the group defined by the `fix neb` command. Not every NEB atom need be in the file, and non-NEB atoms can be listed in the file.

Four kinds of output can be generated during a NEB calculation: energy barrier statistics, thermodynamic output by each replica, dump files, and restart files.

When running with multiple partitions (each of which is a replica in this case), the print-out to the screen and master log.lammps file contains a line of output, printed once every \( Nevery \) timesteps. It contains the timestep, the maximum force per replica, the maximum force per atom (in any replica), potential gradients in the initial, final, and climbing replicas, the forward and backward energy barriers, the total reaction coordinate (RDT), and the normalized reaction coordinate and potential energy of each replica.

The “maximum force per replica” is the two-norm of the 3N-length force vector for the atoms in each replica, maximized across replicas, which is what the \( ftol \) setting is checking against. In this case, N is all the atoms in each replica. The “maximum force per atom” is the maximum force component of any atom in any replica. The potential gradients are the two-norm of the 3N-length force vector solely due to the interaction potential i.e. without adding in inter-replica forces.

The “reaction coordinate” (RD) for each replica is the two-norm of the 3N-length force vector of distances between its atoms and the preceding replica’s atoms, added to the RD of the preceding replica. The RD of the first replica \( RD_1 = 0.0 \); the RD of the final replica \( RD_N = RDT \), the total reaction coordinate. The normalized RDs are divided by RDT, so that they form a monotonically increasing sequence from zero to one. When computing RD, N only includes the atoms being operated on by the fix neb command.

The forward (reverse) energy barrier is the potential energy of the highest replica minus the energy of the first (last) replica.

Supplementary information for all replicas can be printed out to the screen and master log.lammps file by adding the verbose keyword. This information include the following. The “path angle” (pathangle) for the replica i which is the angle between the 3N-length vectors \( (R_{i-1} - R_i) \) and \( (R_{i+1} - R_i) \) (where \( R_i \) is the atomic coordinates of replica i). A “path angle” of 180 indicates that replicas \( i-1 \), \( i \) and \( i+1 \) are aligned. “angletangrad” is the angle between the 3N-length tangent vector and the 3N-length force vector at image i. The tangent vector is calculated as in (HenkelmanA) for all intermediate replicas and at \( R_2 - R_1 \) and \( R_M - R_{M-1} \) for the first and last replica, respectively. “anglegrad” is the angle between the 3N-length energy gradient vector of replica i and that of replica \( i+1 \). It is not defined for the final replica and reads nan. \( gradV \) is the norm of the energy gradient of image i. ReplicaForce is the two-norm of the 3N-length force vector (including nudging forces) for replica i. MaxAtomForce is the maximum force component of any atom in replica i.
When a NEB calculation does not converge properly, the supplementary information can help understanding what is going wrong. For instance when the path angle becomes acute, the definition of tangent used in the NEB calculation is questionable and the NEB cannot may diverge (Maras).

When running on multiple partitions, LAMMPS produces additional log files for each partition, e.g. log.lammps.0, log.lammps.1, etc. For a NEB calculation, these contain the thermodynamic output for each replica.

If *dump* commands in the input script define a filename that includes a *universe* or *uloop* style *variable*, then one dump file (per dump command) will be created for each replica. At the end of the NEB calculation, the final snapshot in each file will contain the sequence of snapshots that transition the system over the energy barrier. Earlier snapshots will show the convergence of the replicas to the MEP.

Likewise, *restart* filenames can be specified with a *universe* or *uloop* style *variable*, to generate restart files for each replica. These may be useful if the NEB calculation fails to converge properly to the MEP, and you wish to restart the calculation from an intermediate point with altered parameters.

There are 2 Python scripts provided in the tools/python directory, *neb_combine.py* and *neb_final.py*, which are useful in analyzing output from a NEB calculation. Assume a NEB simulation with M replicas, and the NEB atoms labeled with a specific atom type.

The *neb_combine.py* script extracts atom coords for the NEB atoms from all M dump files and creates a single dump file where each snapshot contains the NEB atoms from all the replicas and one copy of non-NEB atoms from the first replica (presumed to be identical in other replicas). This can be visualized/animated to see how the NEB atoms relax as the NEB calculation proceeds.

The *neb_final.py* script extracts the final snapshot from each of the M dump files to create a single dump file with M snapshots. This can be visualized to watch the system make its transition over the energy barrier.

To illustrate, here are images from the final snapshot produced by the *neb_combine.py* script run on the dump files produced by the two example input scripts in examples/neb.
17.81.4 Restrictions

This command can only be used if LAMMPS was built with the REPLICA package. See the Build package doc page for more info.

17.82.3 Description

Perform a geodesic nudged elastic band (GNEB) calculation using multiple replicas of a system. Two or more replicas must be used; the first and last are the end points of the transition path.

GNEB is a method for finding both the spin configurations and height of the energy barrier associated with a transition state, e.g. spins to perform a collective rotation from one energy basin to another. The implementation in LAMMPS follows the discussion in the following paper: (BessarabA).

Each replica runs on a partition of one or more processors. Processor partitions are defined at run-time using the -partition command-line switch. Note that if you have MPI installed, you can run a multi-replica simulation with more replicas (partitions) than you have physical processors, e.g. you can run a 10-replica simulation on just one or two processors. You will simply not get the performance speed-up you would see with one or more physical processors per replica. See the Howto replica doc page for further discussion.

Note: As explained below, a GNEB calculation performs a minimization across all the replicas. One of the spin style minimizers has to be defined in your input script.

When a GNEB calculation is performed, it is assumed that each replica is running the same system, though LAMMPS does not check for this. I.e. the simulation domain, the number of magnetic atoms, the interaction potentials, and the starting configuration when the neb command is issued should be the same for every replica.

In a GNEB calculation each replica is connected to other replicas by inter-replica nudging forces. These forces are imposed by the fix neb/spin command, which must be used in conjunction with the neb command. The group used to define the fix neb/spin command defines the GNEB magnetic atoms which are the only ones that inter-replica springs are applied to. If the group does not include all magnetic atoms, then non-GNEB magnetic atoms have no inter-replica springs and the torques they feel and their precession motion is computed in the usual way due only to other magnetic atoms within their replica. Conceptually, the non-GNEB atoms provide a background force field for the GNEB atoms. Their magnetic spins can be allowed to evolve during the GNEB minimization procedure.

The initial spin configuration for each of the replicas can be specified in different manners via the file-style setting, as discussed below. Only atomic spins whose initial coordinates should differ from the current configuration need to be specified.

Conceptually, the initial and final configurations for the first replica should be states on either side of an energy barrier. As explained below, the initial configurations of intermediate replicas can be spin coordinates interpolated in a linear fashion between the first and last replicas. This is often adequate for simple transitions. For more complex transitions, it may lead to slow convergence or even bad results if the minimum energy path (MEP, see below) of states over the barrier cannot be correctly converged to from such an initial path. In this case, you will want to generate initial states for the intermediate replicas that are geometrically closer to the MEP and read them in.

For a file-style setting of final, a filename is specified which contains atomic and spin coordinates for zero or more atoms, in the format described below. For each atom that appears in the file, the new coordinates are assigned to that atom in the final replica. Each intermediate replica also assigns a new spin to that atom in an interpolated manner. This is done by using the current direction of the spin at the starting point and the read-in direction as the final point. The “angular distance” between them is calculated, and the new direction is assigned to be a fraction of the angular distance.

17.82. neb/spin command
Note: The “angular distance” between the starting and final point is evaluated in the geodesic sense, as described in (BessarabA).

Note: The angular interpolation between the starting and final point is achieved using Rodrigues formula:

\[
\vec{m}^\nu_i = \vec{m}^I_i \cos(\omega_i^\nu) + (\vec{k}_i \times \vec{m}^I_i) \sin(\omega_i^\nu) + (1.0 - \cos(\omega_i^\nu))\vec{k}_i (\vec{k}_i \cdot \vec{m}^I_i)
\]

where \(\vec{m}^I_i\) is the initial spin configuration for spin i, \(\omega_i^\nu\) is a rotation angle defined as:

\[
\omega_i^\nu = (\nu - 1) \Delta \omega_i \quad \text{and} \quad \Delta \omega_i = \frac{\omega_i}{Q - 1}
\]

with \(\nu\) the image number, Q the total number of images, and \(\omega_i\) the total rotation between the initial and final spins. \(\vec{k}_i\) defines a rotation axis such as:

\[
\vec{k}_i = \frac{\vec{m}^I_i \times \vec{m}^F_i}{|\vec{m}^I_i \times \vec{m}^F_i|}
\]

if the initial and final spins are not aligned. If the initial and final spins are aligned, then their cross product is null, and the expression above does not apply. If they point toward the same direction, the intermediate images conserve the same orientation. If the initial and final spins are aligned, but point toward opposite directions, an arbitrary rotation vector belonging to the plane perpendicular to initial and final spins is chosen. In this case, a warning message is displayed.

For a file-style setting of each, a filename is specified which is assumed to be unique to each replica. See the neb documentation page for more information about this option.

For a file-style setting of none, no filename is specified. Each replica is assumed to already be in its initial configuration at the time the neb command is issued. This allows each replica to define its own configuration by reading a replica-specific data or restart or dump file, via the read_data, read_restart, or read_dump commands. The replica-specific names of these files can be specified as in the discussion above for the each file-style. Also see the section below for how a NEB calculation can produce restart files, so that a long calculation can be restarted if needed.

Note: None of the file-style settings change the initial configuration of any atom in the first replica. The first replica must thus be in the correct initial configuration at the time the neb command is issued.

A NEB calculation proceeds in two stages, each of which is a minimization procedure. To enable this, you must first define a min_style, using either the spin, spin/cg, or spin/lbfgs style (see min_spin for more information). The other styles cannot be used, since they relax the lattice degrees of freedom instead of the spins.

The minimizer tolerances for energy and force are set by etol and ttol, the same as for the minimize command.

A non-zero etol means that the GNEB calculation will terminate if the energy criterion is met by every replica. The energies being compared to etol do not include any contribution from the inter-replica nudging forces, since these are non-conservative. A non-zero ttol means that the GNEB calculation will terminate if the torque criterion is met by every replica. The torques being compared to ttol include the inter-replica nudging forces.

The maximum number of iterations in each stage is set by N1 and N2. These are effectively timestep counts since each iteration of damped dynamics is like a single timestep in a dynamics run. During both stages, the potential energy of each replica and its normalized distance along the reaction path (reaction coordinate RD) will be printed to the screen.
and log file every *Nevery* timesteps. The RD is 0 and 1 for the first and last replica. For intermediate replicas, it is the cumulative angular distance (normalized by the total cumulative angular distance) between adjacent replicas, where “distance” is defined as the length of the 3N-vector of the geodesic distances in spin coordinates, with N the number of GNEB spins involved (see equation (13) in [BessarabA]). These outputs allow you to monitor NEB’s progress in finding a good energy barrier. *N1* and *N2* must both be multiples of *Nevery*.

In the first stage of GNEB, the set of replicas should converge toward a minimum energy path (MEP) of conformational states that transition over a barrier. The MEP for a transition is defined as a sequence of 3N-dimensional spin states, each of which has a potential energy gradient parallel to the MEP itself. The configuration of highest energy along a MEP corresponds to a saddle point. The replica states will also be roughly equally spaced along the MEP due to the inter-replica nudging force added by the *fix neb* command.

In the second stage of GNEB, the replica with the highest energy is selected and the inter-replica forces on it are converted to a force that drives its spin coordinates to the top or saddle point of the barrier, via the barrier-climbing calculation described in [BessarabA]. As before, the other replicas rearrange themselves along the MEP so as to be roughly equally spaced.

When both stages are complete, if the GNEB calculation was successful, the configurations of the replicas should be along (close to) the MEP and the replica with the highest energy should be a spin configuration at (close to) the saddle point of the transition. The potential energies for the set of replicas represents the energy profile of the transition along the MEP.

An atom map must be defined which it is not by default for *atom_style atomic* problems. The *atom_modify map* command can be used to do this.

An initial value can be defined for the timestep. Although, the *spin* minimization algorithm is an adaptive timestep methodology, so that this timestep is likely to evolve during the calculation.

The minimizers in LAMMPS operate on all spins in your system, even non-GNEB atoms, as defined above.

Each file read by the neb/spin command containing spin coordinates used to initialize one or more replicas must be formatted as follows.

The file can be ASCII text or a gzipped text file (detected by a .gz suffix). The file can contain initial blank lines or comment lines starting with “#” which are ignored. The first non-blank, non-comment line should list N = the number of lines to follow. The N successive lines contain the following information:

```
ID1 g1 x1 y1 z1 sx1 sy1 sz1
ID2 g2 x2 y2 z2 sx2 sy2 sz2
...  
IDN gN yN zN sxN syN szN
```

The fields are the atom ID, the norm of the associated magnetic spin, followed by the x,y,z coordinates and the sx,sy,sz spin coordinates. The lines can be listed in any order. Additional trailing information on the line is OK, such as a comment.

Note that for a typical GNEB calculation you do not need to specify initial spin coordinates for very many atoms to produce differing starting and final replicas whose intermediate replicas will converge to the energy barrier. Typically only new spin coordinates for atoms geometrically near the barrier need be specified.

Also note there is no requirement that the atoms in the file correspond to the GNEB atoms in the group defined by the *fix neb* command. Not every GNEB atom need be in the file, and non-GNEB atoms can be listed in the file.

Four kinds of output can be generated during a GNEB calculation: energy barrier statistics, thermodynamic output by each replica, dump files, and restart files.
When running with multiple partitions (each of which is a replica in this case), the print-out to the screen and master log.lammps file contains a line of output, printed once every `Nevery` timesteps. It contains the timestep, the maximum torque per replica, the maximum torque per atom (in any replica), potential gradients in the initial, final, and climbing replicas, the forward and backward energy barriers, the total reaction coordinate (RDT), and the normalized reaction coordinate and potential energy of each replica.

The “maximum torque per replica” is the two-norm of the 3N-length vector given by the cross product of a spin by its precession vector omega, in each replica, maximized across replicas, which is what the `ttol` setting is checking against. In this case, N is all the atoms in each replica. The “maximum torque per atom” is the maximum torque component of any atom in any replica. The potential gradients are the two-norm of the 3N-length magnetic precession vector solely due to the interaction potential i.e. without adding in inter-replica forces, and projected along the path tangent (as detailed in Appendix D of (BessarabA)).

The “reaction coordinate” (RD) for each replica is the two-norm of the 3N-length vector of geodesic distances between its spins and the preceding replica’s spins (see equation (13) of (BessarabA)), added to the RD of the preceding replica. The RD of the first replica RD1 = 0.0; the RD of the final replica RDN = RDT, the total reaction coordinate. The normalized RDs are divided by RDT, so that they form a monotonically increasing sequence from zero to one. When computing RD, N only includes the spins being operated on by the fix neb/spin command.

The forward (reverse) energy barrier is the potential energy of the highest replica minus the energy of the first (last) replica.

Supplementary information for all replicas can be printed out to the screen and master log.lammps file by adding the `verbose` keyword. This information include the following. The “GradVidottan” are the projections of the potential gradient for the replica i on its tangent vector (as detailed in Appendix D of (BessarabA)). The “DNi” are the non normalized geodesic distances (see equation (13) of (BessarabA)), between a replica i and the next replica i+1. For the last replica, this distance is not defined and a “NAN” value is the corresponding output.

When a NEB calculation does not converge properly, the supplementary information can help understanding what is going wrong.

When running on multiple partitions, LAMMPS produces additional log files for each partition, e.g. log.lammps.0, log.lammps.1, etc. For a GNEB calculation, these contain the thermodynamic output for each replica.

If `dump` commands in the input script define a filename that includes a `universe` or `uloop` style `variable`, then one dump file (per dump command) will be created for each replica. At the end of the GNEB calculation, the final snapshot in each file will contain the sequence of snapshots that transition the system over the energy barrier. Earlier snapshots will show the convergence of the replicas to the MEP.

Likewise, `restart` filenames can be specified with a `universe` or `uloop` style `variable`, to generate restart files for each replica. These may be useful if the GNEB calculation fails to converge properly to the MEP, and you wish to restart the calculation from an intermediate point with altered parameters.

A c file script in provided in the tool/spin/interpolate_gneb directory, that interpolates the MEP given the information provided by the `verbose` output option (as detailed in Appendix D of (BessarabA)).

### 17.8.2.4 Restrictions

This command can only be used if LAMMPS was built with the SPIN package. See the `Build package` doc page for more info.

For magnetic GNEB calculations, only the `spin_none` value for the `line` keyword can be used when minimization styles `spin/cg` and `spin/lbfgs` are employed.

neigh_modify exclude type 2 3
neigh_modify exclude group frozen frozen check no
neigh_modify exclude group residue1 chain3
neigh_modify exclude molecule/intra rigid
```

17.83.3 Description

This command sets parameters that affect the building and use of pairwise neighbor lists. Depending on what pair interactions and other commands are defined, a simulation may require one or more neighbor lists.

The `every`, `delay`, `check`, and `once` options affect how often lists are built as a simulation runs. The `delay` setting means never build new lists until at least N steps after the previous build. The `every` setting means build lists every M steps (after the delay has passed). If the `check` setting is `no`, the lists are built on the first step that satisfies the `delay` and `every` settings. If the `check` setting is `yes`, then the `every` and `delay` settings determine when a build may possibly be performed, but an actual build only occurs if some atom has moved more than half the skin distance (specified in the `neighbor` command) since the last build.

If the `once` setting is `yes`, then the neighbor list is only built once at the beginning of each run, and never rebuilt, except on steps when a restart file is written, or steps when a fix forces a rebuild to occur (e.g. fixes that create or delete atoms, such as `fix deposit` or `fix evaporate`). This setting should only be made if you are certain atoms will not move far enough that the neighbor list should be rebuilt, e.g. running a simulation of a cold crystal. Note that it is not that expensive to check if neighbor lists should be rebuilt.

When the rRESPA integrator is used (see the `run_style` command), the `every` and `delay` parameters refer to the longest (outermost) timestep.

The `cluster` option does a sanity test every time neighbor lists are built for bond, angle, dihedral, and improper interactions, to check that each set of 2, 3, or 4 atoms is a cluster of nearby atoms. It does this by computing the distance between pairs of atoms in the interaction and insuring they are not further apart than half the periodic box length. If they are, an error is generated, since the interaction would be computed between far-away atoms instead of their nearby periodic images. The only way this should happen is if the pairwise cutoff is so short that atoms that are part of the same interaction are not communicated as ghost atoms. This is an unusual model (e.g. no pair interactions at all) and the problem can be fixed by use of the `comm_modify cutoff` command. Note that to save time, the default `cluster` setting is `no`, so that this check is not performed.

The `include` option limits the building of pairwise neighbor lists to atoms in the specified group. This can be useful for models where a large portion of the simulation is particles that do not interact with other particles or with each other via pairwise interactions. The group specified with this option must also be specified via the `atom_modify first` command. Note that specifying “all” as the group-ID effectively turns off the `include` option.

The `exclude` option turns off pairwise interactions between certain pairs of atoms, by not including them in the neighbor list. These are sample scenarios where this is useful:

- In crack simulations, pairwise interactions can be shut off between 2 slabs of atoms to effectively create a crack.
- When a large collection of atoms is treated as frozen, interactions between those atoms can be turned off to save needless computation. E.g. Using the `fix setforce` command to freeze a wall or portion of a bio-molecule.
• When one or more rigid bodies are specified, interactions within each body can be turned off to save needless computation. See the fix rigid command for more details.

The exclude type option turns off the pairwise interaction if one atom is of type M and the other of type N. M can equal N. The exclude group option turns off the interaction if one atom is in the first group and the other is the second. Group1-ID can equal group2-ID. The exclude molecule/intra option turns off the interaction between pairs of atoms that have different molecule IDs and are both in the specified group. The exclude molecule/inter turns off the interaction if both atoms are in the same moleucle, as determined by their molecule ID. The exclude molecule/inter turns off the interaction between pairs of atoms that have different molecule IDs and are both in the specified group.

Each of the exclude options can be specified multiple times. The exclude type option is the most efficient option to use; it requires only a single check, no matter how many times it has been specified. The other exclude options are more expensive if specified multiple times; they require one check for each time they have been specified.

Note that the exclude options only affect pairwise interactions; see the delete_bonds command for information on turning off bond interactions.

Note: Excluding pairwise interactions will not work correctly when also using a long-range solver via the kspace_style command. LAMMPS will give a warning to this effect. This is because the short-range pairwise interaction needs to subtract off a term from the total energy for pairs whose short-range interaction is excluded, to compensate for how the long-range solver treats the interaction. This is done correctly for pairwise interactions that are excluded (or weighted) via the special_bonds command. But it is not done for interactions that are excluded via these neigh_modify exclude options.

The page and one options affect how memory is allocated for the neighbor lists. For most simulations the default settings for these options are fine, but if a very large problem is being run or a very long cutoff is being used, these parameters can be tuned. The indices of neighboring atoms are stored in “pages”, which are allocated one after another as they fill up. The size of each page is set by the page value. A new page is allocated when the next atom’s neighbors could potentially overflow the list. This threshold is set by the one value which tells LAMMPS the maximum number of neighbor’s one atom can have.

Note: LAMMPS can crash without an error message if the number of neighbors for a single particle is larger than the page setting, which means it is much, much larger than the one setting. This is because LAMMPS does not error check these limits for every pairwise interaction (too costly), but only after all the particle’s neighbors have been found. This problem usually means something is very wrong with the way you have setup your problem (particle spacing, cutoff length, neighbor skin distance, etc). If you really expect that many neighbors per particle, then boost the one and page settings accordingly.

The binsize option allows you to specify what size of bins will be used in neighbor list construction to sort and find neighboring atoms. By default, for neighbor style bin, LAMMPS uses bins that are 1/2 the size of the maximum pair cutoff. For neighbor style multi, the bins are 1/2 the size of the minimum pair cutoff. Typically these are good values for minimizing the time for neighbor list construction. This setting overrides the default. If you make it too big, there is little overhead due to looping over bins, but more atoms are checked. If you make it too small, the optimal number of atoms is checked, but bin overhead goes up. If you set the binsize to 0.0, LAMMPS will use the default binsize of 1/2 the cutoff.
17.83.4 Restrictions

If the “delay” setting is non-zero, then it must be a multiple of the “every” setting.
The molecule/intra and molecule/inter exclude options can only be used with atom styles that define molecule IDs.
The value of the page setting must be at least 10x larger than the one setting. This insures neighbor pages are not mostly empty space.

17.83.5 Related commands

neighbor, delete_bonds

17.83.6 Default

The option defaults are delay = 10, every = 1, check = yes, once = no, cluster = no, include = all (same as no include option defined), exclude = none, page = 100000, one = 2000, and binsize = 0.0.

17.84 neighbor command

17.84.1 Syntax

```bash
neighbor skin style
```

- skin = extra distance beyond force cutoff (distance units)
- style = bin or nsq or multi

17.84.2 Examples

```bash
neighbor 0.3 bin
neighbor 2.0 nsq
```

17.84.3 Description

This command sets parameters that affect the building of pairwise neighbor lists. All atom pairs within a neighbor cutoff distance equal to the their force cutoff plus the skin distance are stored in the list. Typically, the larger the skin distance, the less often neighbor lists need to be built, but more pairs must be checked for possible force interactions every timestep. The default value for skin depends on the choice of units for the simulation; see the default values below.

The skin distance is also used to determine how often atoms migrate to new processors if the check option of the neigh_modify command is set to yes. Atoms are migrated (communicated) to new processors on the same timestep that neighbor lists are re-built.

The style value selects what algorithm is used to build the list. The bin style creates the list by binning which is an operation that scales linearly with N/P, the number of atoms per processor where N = total number of atoms and P = number of processors. It is almost always faster than the nsq style which scales as (N/P)^2. For unsolvated small molecules in a non-periodic box, the nsq choice can sometimes be faster. Either style should give the same answers.
The *multi* style is a modified binning algorithm that is useful for systems with a wide range of cutoff distances, e.g. due to different size particles. For the *bin* style, the bin size is set to 1/2 of the largest cutoff distance between any pair of atom types and a single set of bins is defined to search over for all atom types. This can be inefficient if one pair of types has a very long cutoff, but other type pairs have a much shorter cutoff. For style *multi* the bin size is set to 1/2 of the shortest cutoff distance and multiple sets of bins are defined to search over for different atom types. This imposes some extra setup overhead, but the searches themselves may be much faster for the short-cutoff cases. See the *comm_modify mode multi* command for a communication option that may also be beneficial for simulations of this kind.

The *neigh_modify* command has additional options that control how often neighbor lists are built and which pairs are stored in the list.

When a run is finished, counts of the number of neighbors stored in the pairwise list and the number of times neighbor lists were built are printed to the screen and log file. See the *Run output* doc page for details.

### 17.84.6 Default

- 0.3 bin for units = lj, skin = 0.3 sigma
- 2.0 bin for units = real or metal, skin = 2.0 Angstroms
- 0.001 bin for units = si, skin = 0.001 meters = 1.0 mm
- 0.1 bin for units = cgs, skin = 0.1 cm = 1.0 mm

### 17.85 newton command

#### 17.85.1 Syntax

```
newton flag
newton flag1 flag2
```

- *flag = on or off* for both pairwise and bonded interactions
- *flag1 = on or off* for pairwise interactions
- *flag2 = on or off* for bonded interactions
17.85.2 Examples

```plaintext
newton off
newton on off
```

17.85.3 Description

This command turns Newton’s third law on or off for pairwise and bonded interactions. For most problems, setting Newton’s third law to on means a modest savings in computation at the cost of two times more communication. Whether this is faster depends on problem size, force cutoff lengths, a machine’s compute/communication ratio, and how many processors are being used.

Setting the pairwise newton flag to off means that if two interacting atoms are on different processors, both processors compute their interaction and the resulting force information is not communicated. Similarly, for bonded interactions, newton off means that if a bond, angle, dihedral, or improper interaction contains atoms on 2 or more processors, the interaction is computed by each processor.

LAMMPS should produce the same answers for any newton flag settings, except for round-off issues.

With run_style respa and only bonded interactions (bond, angle, etc) computed in the innermost timestep, it may be faster to turn newton off for bonded interactions, to avoid extra communication in the innermost loop.

17.85.4 Restrictions

The newton bond setting cannot be changed after the simulation box is defined by a read_data or create_box command.

17.86 next command

17.86.1 Syntax

```
next variables
```

- variables = one or more variable names
17.86.2 Examples

```plaintext
next x
next a t x myTemp
```

17.86.3 Description

This command is used with variables defined by the `variable` command. It assigns the next value to the variable from the list of values defined for that variable by the `variable` command. Thus when that variable is subsequently substituted for in an input script command, the new value is used.

See the `variable` command for info on how to define and use different kinds of variables in LAMMPS input scripts. If a variable name is a single lower-case character from “a” to “z”, it can be used in an input script command as $a or $z. If it is multiple letters, it can be used as ${myTemp}.

If multiple variables are used as arguments to the `next` command, then all must be of the same variable style: `index`, `loop`, `file`, `universe`, or `uloop`. An exception is that `universe`- and `uloop`-style variables can be mixed in the same `next` command.

All the variables specified with the `next` command are incremented by one value from their respective list of values. A `file`-style variable reads the next line from its associated file. An `atomfile`-style variable reads the next set of lines (one per atom) from its associated file. String-, `atom`-, or `equal`-, or `world`-style variables cannot be used with the `next` command, since they only store a single value.

When any of the variables in the `next` command has no more values, a flag is set that causes the input script to skip the next `jump` command encountered. This enables a loop containing a `next` command to exit. As explained in the `variable` command, the variable that has exhausted its values is also deleted. This allows it to be used and re-defined later in the input script. `File`-style and `atomfile`-style variables are exhausted when the end-of-file is reached.

When the next command is used with `index`- or `loop`-style variables, the next value is assigned to the variable for all processors. When the next command is used with `file`-style variables, the next line is read from its file and the string assigned to the variable. When the next command is used with `atomfile`-style variables, the next set of per-atom values is read from its file and assigned to the variable.

When the next command is used with `universe`- or `uloop`-style variables, all `universe`- or `uloop`-style variables must be listed in the `next` command. This is because of the manner in which the incrementing is done, using a single lock file for all variables. The next value (for each variable) is assigned to whichever processor partition executes the command first. All processors in the partition are assigned the same value(s). Running LAMMPS on multiple partitions of processors via the `-partition command-line switch`. `Universe`- and `uloop`-style variables are incremented using the files “tmp.lammps.variable” and “tmp.lammps.variable.lock” which you will see in your directory during and after such a LAMMPS run.

Here is an example of running a series of simulations using the `next` command with an `index`-style variable. If this input script is named `in.polymer`, 8 simulations would be run using data files from directories `run1` through `run8`.

```plaintext
variable d index run1 run2 run3 run4 run5 run6 run7 run8
shell cd $d
read_data data.polymer
run 10000
shell cd..
clear
next d
jump in.polymer
```

If the variable “d” were of style `universe`, and the same in.polymer input script were run on 3 partitions of processors, then the first 3 simulations would begin, one on each set of processors. Whichever partition finished first, it would assign variable “d” the fourth value and run another simulation, and so forth until all 8 simulations were finished.
Jump and next commands can also be nested to enable multi-level loops. For example, this script will run 15 simulations in a double loop.

```plaintext
variable i loop 3
variable j loop 5

... 
read_data data.polymer.$i$j
print Running simulation $i.$j
run 10000
next j
jump in.script
next i
jump in.script
```

Here is an example of a double loop which uses the if and jump commands to break out of the inner loop when a condition is met, then continues iterating through the outer loop.

```plaintext
label loopa
variable a loop 5

label loopb
variable b loop 5
print "A,B = $a,$b"
run 10000
if $b > 2 then "jump in.script break"
next b
jump in.script loopb

label break
variable b delete

next a
jump in.script loopa
```

17.86.4 Restrictions
As described above.

    cuda/aware value = off or on
        off = do not use CUDA-aware MPI
        on = use CUDA-aware MPI (default)

omp args = Nthreads keyword value ...
    NThread = # of OpenMP threads to associate with each MPI process
    zero or more keyword/value pairs may be appended
    keywords = neigh
    neigh value = yes or no
        yes = threaded neighbor list build (default)
        no = non-threaded neighbor list build
17.87.2 Examples

```
package gpu 1
package gpu 1 split 0.75
package gpu 2 split -1.0
package gpu 1 device kepler
gpu 1 device generic
package gpu 1 device custom
package kokkos neigh half comm device
package omp 0 neigh no
package omp 4
package intel 1
package intel 2 omp 4 mode mixed balance 0.5
```

17.87.3 Description

This command invokes package-specific settings for the various accelerator packages available in LAMMPS. Currently, the following packages use settings from this command: GPU, USER-INTEL, KOKKOS, and USER-OMP.

If this command is specified in an input script, it must be near the top of the script, before the simulation box has been defined. This is because it specifies settings that the accelerator packages use in their initialization, before a simulation is defined.

This command can also be specified from the command-line when launching LAMMPS, using the “-pk” command-line switch. The syntax is exactly the same as when used in an input script.

Note that all of the accelerator packages require the package command to be specified (except the OPT package), if the package is to be used in a simulation (LAMMPS can be built with an accelerator package without using it in a particular simulation). However, in all cases, a default version of the command is typically invoked by other accelerator settings.

The KOKKOS package requires a “-k on” command-line switch respectively, which invokes a “package kokkos” command with default settings.

For the GPU, USER-INTEL, and USER-OMP packages, if a “-sf gpu” or “-sf intel” or “-sf omp” command-line switch is used to auto-append accelerator suffixes to various styles in the input script, then those switches also invoke a “package gpu”, “package intel”, or “package omp” command with default settings.

**Note:** A package command for a particular style can be invoked multiple times when a simulation is setup, e.g. by the -c on, -k on, -sf, and -pk command-line switches, and by using this command in an input script. Each time it is used all of the style options are set, either to default values or to specified settings. I.e. settings from previous invocations do not persist across multiple invocations.

See the Speed packages doc page for more details about using the various accelerator packages for speeding up LAMMPS simulations.

The `gpu` style invokes settings associated with the use of the GPU package.

The `Np_gpu` argument sets the number of GPUs per node. There must be at least as many MPI tasks per node as GPUs, as set by the mpirun or mpiexec command. If there are more MPI tasks (per node) than GPUs, multiple MPI tasks will share each GPU.

Optional keyword/value pairs can also be specified. Each has a default value as listed below.
The `neigh` keyword specifies where neighbor lists for pair style computation will be built. If `neigh` is *yes*, which is the default, neighbor list building is performed on the GPU. If `neigh` is *no*, neighbor list building is performed on the CPU. GPU neighbor list building currently cannot be used with a triclinic box. GPU neighbor lists are not compatible with commands that are not GPU-enabled. When a non-GPU enabled command requires a neighbor list, it will also be built on the CPU. In these cases, it will typically be more efficient to only use CPU neighbor list builds.

The `newton` keyword sets the Newton flags for pairwise (not bonded) interactions to *off* or *on*, the same as the `newton` command allows. Currently, only an *off* value is allowed, since all the GPU package pair styles require this setting. This means more computation is done, but less communication. In the future a value of *on* may be allowed, so the `newton` keyword is included as an option for compatibility with the package command for other accelerator styles. Note that the newton setting for bonded interactions is not affected by this keyword.

The `binsize` keyword sets the size of bins used to bin atoms in neighbor list builds performed on the GPU, if `neigh = yes` is set. If `binsize` is set to 0.0 (the default), then bins = the size of the pairwise cutoff + neighbor skin distance. This is 2x larger than the LAMMPS default used for neighbor list building on the CPU. This will be close to optimal for the GPU, so you do not normally need to use this keyword. Note that if you use a longer-than-usual pairwise cutoff, e.g. to allow for a smaller fraction of KSpace work with a long-range Coulombic solver because the GPU is faster at performing pairwise interactions, then it may be optimal to make the `binsize` smaller than the default. For example, with a cutoff of 20\*sigma in LJ units and a neighbor skin distance of sigma, a `binsize` = 5.25\*sigma can be more efficient than the default.

The `split` keyword can be used for load balancing force calculations between CPU and GPU cores in GPU-enabled pair styles. If 0 < `split` < 1.0, a fixed fraction of particles is offloaded to the GPU while force calculation for the other particles occurs simultaneously on the CPU. If `split` < 0.0, the optimal fraction (based on CPU and GPU timings) is calculated every 25 timesteps, i.e. dynamic load-balancing across the CPU and GPU is performed. If `split` = 1.0, all force calculations for GPU accelerated pair styles are performed on the GPU. In this case, other hybrid pair interactions, bond, angle, dihedral, improper, and long-range calculations can be performed on the CPU while the GPU is performing force calculations for the GPU-enabled pair style. If all CPU force computations complete before the GPU completes, LAMMPS will block until the GPU has finished before continuing the timestep.

As an example, if you have two GPUs per node and 8 CPU cores per node, and would like to run on 4 nodes (32 cores) with dynamic balancing of force calculation across CPU and GPU cores, you could specify

```
mpirun -np 32 -sf gpu -in in.script    # launch command
package gpu 2 split -1    # input script command
```

In this case, all CPU cores and GPU devices on the nodes would be utilized. Each GPU device would be shared by 4 CPU cores. The CPU cores would perform force calculations for some fraction of the particles at the same time the GPUs performed force calculation for the other particles.

The `gpuID` keyword allows selection of which GPUs on each node will be used for a simulation. The first and last values specify the GPU IDs to use (from 0 to Ngpu-1). By default, first = 0 and last = Ngpu-1, so that all GPUs are used, assuming Ngpu is set to the number of physical GPUs. If you only wish to use a subset, set Ngpu to a smaller number and first/last to a sub-range of the available GPUs.

The `tpa` keyword sets the number of GPU thread per atom used to perform force calculations. With a default value of 1, the number of threads will be chosen based on the pair style, however, the value can be set explicitly with this keyword to fine-tune performance. For large cutoffs or with a small number of particles per GPU, increasing the value can improve performance. The number of threads per atom must be a power of 2 and currently cannot be greater than 32.

The `device` keyword can be used to tune parameters optimized for a specific accelerator and platform when using OpenCL. OpenCL supports the concept of a platform, which represents one or more devices that share the same driver (e.g. there would be a different platform for GPUs from different vendors or for CPU based accelerator support). In LAMMPS only one platform can be active at a time and by default the first platform with an accelerator is selected. This is equivalent to using a platform ID of -1. The platform ID is a number corresponding to the output of the ocl_get_devices tool. The platform ID is passed to the GPU library, by prefixing the `device` keyword with that number separated by a colon. For CUDA, the `device` keyword is ignored. Currently, the device tuning support is limited.
to NVIDIA Kepler, NVIDIA Fermi, AMD Cypress, Intel x86_64 CPU, Intel Xeon Phi, or a generic device. More devices may be added later. The default device type can be specified when building LAMMPS with the GPU library, via setting a variable in the lib/gpu/Makefile that is used.

In addition, a device type \textit{custom} is available, which is followed by 13 comma separated numbers, which allows to set those tweakable parameters from the package command. It can be combined with the (colon separated) platform id. The individual settings are:

- MEM_THREADS
- THREADS_PER_ATOM
- THREADS_PER_CHARGE
- BLOCK_PAIR
- MAX_SHARED_TYPES
- BLOCK_NBOR_BUILD
- BLOCK_BIO_PAIR
- BLOCK_ELLIPSE
- WARP_SIZE
- PPPM_BLOCK_1D
- BLOCK_CELL_2D
- BLOCK_CELL_ID
- MAX_BIO_SHARED_TYPES

The \textit{blocksize} keyword allows you to tweak the number of threads used per thread block. This number should be a multiple of 32 (for GPUs) and its maximum depends on the specific GPU hardware. Typical choices are 64, 128, or 256. A larger block size increases occupancy of individual GPU cores, but reduces the total number of thread blocks, thus may lead to load imbalance.

The \textit{intel} style invokes settings associated with the use of the USER-INTEL package. All of its settings, except the \textit{omp} and \textit{mode} keywords, are ignored if LAMMPS was not built with Xeon Phi co-processor support. All of its settings, including the \textit{omp} and \textit{mode} keyword are applicable if LAMMPS was built with co-processor support.

The \textit{Nphi} argument sets the number of co-processors per node. This can be set to any value, including 0, if LAMMPS was not built with co-processor support.

Optional keyword/value pairs can also be specified. Each has a default value as listed below.

The \textit{omp} keyword determines the number of OpenMP threads allocated for each MPI task when any portion of the interactions computed by a USER-INTEL pair style are run on the CPU. This can be the case even if LAMMPS was built with co-processor support; see the \textit{balance} keyword discussion below. If you are running with less MPI tasks/node than there are CPUs, it can be advantageous to use OpenMP threading on the CPUs.

\textbf{Note:} The \textit{omp} keyword has nothing to do with co-processor threads on the Xeon Phi; see the \textit{tpc} and \textit{tptask} keywords below for a discussion of co-processor threads.

The \textit{Nthread} value for the \textit{omp} keyword sets the number of OpenMP threads allocated for each MPI task. Setting \textit{Nthread} = 0 (the default) instructs LAMMPS to use whatever value is the default for the given OpenMP environment. This is usually determined via the \textit{OMP_NUM_THREADS} environment variable or the compiler runtime, which is usually a value of 1.
For more details, including examples of how to set the OMP_NUM_THREADS environment variable, see the discussion of the Nthreads setting on this doc page for the “package omp” command. Nthreads is a required argument for the USER-OMP package. Its meaning is exactly the same for the USER-INTEL package.

Note: If you build LAMMPS with both the USER-INTEL and USER-OMP packages, be aware that both packages allow setting of the Nthreads value via their package commands, but there is only a single global Nthreads value used by OpenMP. Thus if both package commands are invoked, you should insure the two values are consistent. If they are not, the last one invoked will take precedence, for both packages. Also note that if the -sf hybrid intel omp command-line switch is used, it invokes a “package intel” command, followed by a “package omp” command, both with a setting of Nthreads = 0.

The mode keyword determines the precision mode to use for computing pair style forces, either on the CPU or on the co-processor, when using a USER-INTEL supported pair style. It can take a value of single, mixed which is the default, or double. Single means single precision is used for the entire force calculation. Mixed means forces between a pair of atoms are computed in single precision, but accumulated and stored in double precision, including storage of forces, torques, energies, and virial quantities. Double means double precision is used for the entire force calculation.

The lrt keyword can be used to enable “Long Range Thread (LRT)” mode. It can take a value of yes to enable and no to disable. LRT mode generates an extra thread (in addition to any OpenMP threads specified with the OMP_NUM_THREADS environment variable or the omp keyword). The extra thread is dedicated for performing part of the PPPM solver computations and communications. This can improve parallel performance on processors supporting Simultaneous Multithreading (SMT) such as Hyper-Threading (HT) on Intel processors. In this mode, one additional thread is generated per MPI process. LAMMPS will generate a warning in the case that more threads are used than available in SMT hardware on a node. If the PPPM solver from the USER-INTEL package is not used, then the LRT setting is ignored and no extra threads are generated. Enabling LRT will replace the run_style with the verlet/lrt/intel style that is identical to the default verlet style aside from supporting the LRT feature. This feature requires setting the pre-processor flag -DLMP_INTEL_USELRT in the makefile when compiling LAMMPS.

The balance keyword sets the fraction of pair style work offloaded to the co-processor for split values between 0.0 and 1.0 inclusive. While this fraction of work is running on the co-processor, other calculations will run on the host, including neighbor and pair calculations that are not offloaded, as well as angle, bond, dihedral, kspace, and some MPI communications. If split is set to -1, the fraction of work is dynamically adjusted automatically throughout the run. This typically give performance within 5 to 10 percent of the optimal fixed fraction.

The ghost keyword determines whether or not ghost atoms, i.e. atoms at the boundaries of processor sub-domains, are offloaded for neighbor and force calculations. When the value = “no”, ghost atoms are not offloaded. This option can reduce the amount of data transfer with the co-processor and can also overlap MPI communication of forces with computation on the co-processor when the newton pair setting is “on”. When the value = “yes”, ghost atoms are offloaded. In some cases this can provide better performance, especially if the balance fraction is high.

The tpc keyword sets the max # of co-processor threads Ntpc that will run on each core of the co-processor. The default value = 4, which is the number of hardware threads per core supported by the current generation Xeon Phi chips.

The tptask keyword sets the max # of co-processor threads (Nptask* assigned to each MPI task. The default value = 240, which is the total # of threads an entire current generation Xeon Phi chip can run (240 = 60 cores * 4 threads/core). This means each MPI task assigned to the Phi will enough threads for the chip to run the max allowed, even if only 1 MPI task is assigned. If 8 MPI tasks are assigned to the Phi, each will run with 30 threads. If you wish to limit the number of threads per MPI task, set tptask to a smaller value. E.g. for tptask = 16, if 8 MPI tasks are assigned, each will run with 16 threads, for a total of 128.

Note that the default settings for tpc and tptask are fine for most problems, regardless of how many MPI tasks you assign to a Phi.

The no_affinity keyword will turn off automatic setting of core affinity for MPI tasks and OpenMP threads on the host when using offload to a co-processor. Affinity settings are used when possible to prevent MPI tasks and OpenMP
threads from being on separate NUMA domains and to prevent offload threads from interfering with other processes/threads used for LAMMPS.

The *kokkos* style invokes settings associated with the use of the KOKKOS package. All of the settings are optional keyword/value pairs. Each has a default value as listed below.

The *neigh* keyword determines how neighbor lists are built. A value of *half* uses a thread-safe variant of half-neighbor lists, the same as used by most pair styles in LAMMPS, which is the default when running on CPUs (i.e. the Kokkos CUDA back end is not enabled).

A value of *full* uses a full neighbor lists and is the default when running on GPUs. This performs twice as much computation as the *half* option, however that is often a win because it is thread-safe and does not require atomic operations in the calculation of pair forces. For that reason, *full* is the default setting for GPUs. However, when running on CPUs, a *half* neighbor list is the default because it are often faster, just as it is for non-accelerated pair styles. Similarly, the *neigh/qeq* keyword determines how neighbor lists are built for *fix qeq/react/kk*. If not explicitly set, the value of *neigh/qeq* will match *neigh*.

If the *neigh/thread* keyword is set to *off*, then the KOKKOS package threads only over atoms. However, for small systems, this may not expose enough parallelism to keep a GPU busy. When this keyword is set to *on*, the KOKKOS package threads over both atoms and neighbors of atoms. When using *neigh/thread on*, a full neighbor list must also be used. Using *neigh/thread on* may be slower for large systems, so this this option is turned on by default only when there are 16K atoms or less owned by an MPI rank and when using a full neighbor list. Not all KOKKOS-enabled potentials support this keyword yet, and only thread over atoms. Many simple pair-wise potentials such as Lennard-Jones do support threading over both atoms and neighbors.

The *newton* keyword sets the Newton flags for pairwise and bonded interactions to *off* or *on*, the same as the *newton* command allows. The default for GPUs is *off* because this will almost always give better performance for the KOKKOS package. This means more computation is done, but less communication. However, when running on CPUs a value of *on* is the default since it can often be faster, just as it is for non-accelerated pair styles.

The *binsize* keyword sets the size of bins used to bin atoms in neighbor list builds. The same value can be set by the *neigh_modify binsize* command. Making it an option in the package kokkos command allows it to be set from the command line. The default value for CPUs is 0.0, which means the LAMMPS default will be used, which is bins = 1/2 the size of the pairwise cutoff + neighbor skin distance. This is fine when neighbor lists are built on the CPU. For GPU builds, a 2x larger binsize equal to the pairwise cutoff + neighbor skin is often faster, which is the default. Note that if you use a longer-than-usual pairwise cutoff, e.g. to allow for a smaller fraction of KSpace work with a *long-range Coulombic solver* because the GPU is faster at performing pairwise interactions, then this rule of thumb may give too large a binsize and the default should be overridden with a smaller value.

The *comm* and *comm/exchange* and *comm/forward* and *comm/reverse* keywords determine whether the host or device performs the packing and unpacking of data when communicating per-atom data between processors. “Exchange” communication happens only on timesteps that neighbor lists are rebuilt. The data is only for atoms that migrate to new processors. “Forward” communication happens every timestep. “Reverse” communication happens every timestep if the *newton* option is on. The data is for atom coordinates and any other atom properties that needs to be updated for ghost atoms owned by each processor.

The *comm* keyword is simply a short-cut to set the same value for both the *comm/exchange* and *comm/forward* and *comm/reverse* keywords.

The value options for all 3 keywords are *no* or *host* or *device*. A value of *no* means to use the standard non-KOKKOS method of packing/unpacking data for the communication. A value of *host* means to use the host, typically a multi-core CPU, and perform the packing/unpacking in parallel with threads. A value of *device* means to use the device, typically a GPU, to perform the packing/unpacking operation.

The optimal choice for these keywords depends on the input script and the hardware used. The *no* value is useful for verifying that the Kokkos-based *host* and *device* values are working correctly. It is the default when running on CPUs since it is usually the fastest.
When running on CPUs or Xeon Phi, the *host* and *device* values work identically. When using GPUs, the *device* value is the default since it will typically be optimal if all of your styles used in your input script are supported by the KOKKOS package. In this case data can stay on the GPU for many timesteps without being moved between the host and GPU, if you use the *device* value. If your script uses styles (e.g. fixes) which are not yet supported by the KOKKOS package, then data has to be moved between the host and device anyway, so it is typically faster to let the host handle communication, by using the *host* value. Using *host* instead of *no* will enable use of multiple threads to pack/unpack communicated data. When running small systems on a GPU, performing the exchange pack/unpack on the host CPU can give speedup since it reduces the number of CUDA kernel launches.

The *cuda/aware* keyword chooses whether CUDA-aware MPI will be used. When this keyword is set to *on*, buffers in GPU memory are passed directly through MPI send/receive calls. This reduces overhead of first copying the data to the host CPU. However CUDA-aware MPI is not supported on all systems, which can lead to segmentation faults and would require using a value of *off*. If LAMMPS can safely detect that CUDA-aware MPI is not available (currently only possible with OpenMPI v2.0.0 or later), then the *cuda/aware* keyword is automatically set to *off* by default. When the *cuda/aware* keyword is set to *off* while any of the *comm* keywords are set to *device*, the value for these *comm* keywords will be automatically changed to *host*. This setting has no effect if not running on GPUs or if using only one MPI rank. CUDA-aware MPI is available for OpenMPI 1.8 (or later versions), Mvapich2 1.9 (or later) when the “MV2_USE_CUDA” environment variable is set to “1”, CrayMPI, and IBM Spectrum MPI when the “-gpu” flag is used.

The *omp* style invokes settings associated with the use of the USER-OMP package.

The *Nthread* argument sets the number of OpenMP threads allocated for each MPI task. For example, if your system has nodes with dual quad-core processors, it has a total of 8 cores per node. You could use two MPI tasks per node (e.g. using the -ppn option of the mpirun command in MPICH or -npernode in OpenMPI), and set *Nthreads = 4*. This would use all 8 cores on each node. Note that the product of MPI tasks * threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer.

Setting *Nthread = 0* instructs LAMMPS to use whatever value is the default for the given OpenMP environment. This is usually determined via the *OMP_NUM_THREADS* environment variable or the compiler runtime. Note that in most cases the default for OpenMP capable compilers is to use one thread for each available CPU core when *OMP_NUM_THREADS* is not explicitly set, which can lead to poor performance.

Here are examples of how to set the environment variable when launching LAMMPS:

```bash
env OMP_NUM_THREADS=4 lmp_machine -sf omp -in in.script
env OMP_NUM_THREADS=2 mpirun -np 2 lmp_machine -sf omp -in in.script
mpirun -x OMP_NUM_THREADS=2 -np 2 lmp_machine -sf omp -in in.script
```

or you can set it permanently in your shell’s start-up script. All three of these examples use a total of 4 CPU cores.

Note that different MPI implementations have different ways of passing the *OMP_NUM_THREADS* environment variable to all MPI processes. The second example line above is for MPICH; the third example line with *-x* is for OpenMPI. Check your MPI documentation for additional details.

What combination of threads and MPI tasks gives the best performance is difficult to predict and can depend on many components of your input. Not all features of LAMMPS support OpenMP threading via the USER-OMP package and the parallel efficiency can be very different, too.

Optional keyword/value pairs can also be specified. Each has a default value as listed below.

The *neigh* keyword specifies whether neighbor list building will be multi-threaded in addition to force calculations. If *neigh* is set to *no* then neighbor list calculation is performed only by MPI tasks with no OpenMP threading. If *mode* is *yes* (the default), a multi-threaded neighbor list build is used. Using *neigh = yes* is almost always faster and should produce identical neighbor lists at the expense of using more memory. Specifically, neighbor list pages are allocated for all threads at the same time and each thread works within its own pages.
17.87.4 Restrictions

This command cannot be used after the simulation box is defined by a read_data or create_box command.

The gpu style of this command can only be invoked if LAMMPS was built with the GPU package. See the Build package doc page for more info.

The intel style of this command can only be invoked if LAMMPS was built with the USER-INTEL package. See the Build package doc page for more info.
