### Mass Fraction Analysis Enables Construction of Lumped Kinetic Model

Product Window Predicted by RMD Model  
Time = 1 billion years; Density = 1g/cm<sup>3</sup>

High T RMD has difficulty in predicting product selectivity

k: first order rate constants  
A: mass stoichiometry coefficients

ExxonMobil Research and Engineering

### Time Scale of RMD Simulation Extended Using Parallel Replica Dynamics

- Parallelizes rare event simulation in time domain

Assumptions:

- Infrequent events
- Very long vibrational dynamics + a brief transition
- Transitions can be detected
- Exponential distribution of first-escape times
- Correlation time known

State 1, State 2, State 3

correlation  
dephasing

$p(t) = k_{rel} \exp(-k_{rel}t)$   
 $p(t) = ke^{-kt}$

PRD is coupled with REAXFF in LAMMPS by implementing a connectivity-based event detection

Phys. Rev. B, 57, R13985 (1998)

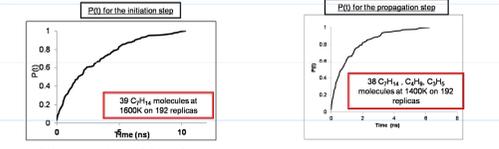

ExxonMobil Research and Engineering

### Event Detection in PRD

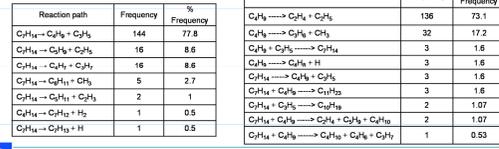

- Position-based event detection
  - If any particular atom is displaced by more than certain cutoff distance, then the program tags that instance as a transition event.
  - Works well for crystalline systems
    - Suited for diffusivity studies in crystal structures
    - vacancies
    - adatoms
  - Not a choice for gas phase chemical reactions
- Connectivity-based event detection
  - Implemented new event detection for reactive potential ReaxFF
  - Keep track of the connectivity and number of neighbors surrounding every atom
  - Criteria for identifying transition event
    - Change in number of neighbors surrounding any atom
    - Change in total number of molecules present in the system. This condition allows user to neglect isomerization (optional)

ExxonMobil Research and Engineering

### Evaluation of Exponential Decay Assumption of First Escape Time

PRD for the initiation step  
39 C<sub>20</sub>H<sub>20</sub>O<sub>2</sub> molecules at 1500K on 192 replicas  
 $P(t) = 1 - e^{-kt}$  with  $k = 3.81 \times 10^8 \text{ s}^{-1}$

PRD for the propagation step  
38 C<sub>20</sub>H<sub>20</sub>O<sub>2</sub>, C<sub>21</sub>H<sub>20</sub>O<sub>2</sub>, C<sub>22</sub>H<sub>20</sub>O<sub>2</sub> molecules at 1400K on 192 replicas

Reaction Path	Frequency	% Frequency
C <sub>20</sub> H <sub>20</sub> O <sub>2</sub> → C <sub>20</sub> H <sub>18</sub> O <sub>2</sub> + C <sub>2</sub> H <sub>2</sub>	144	77.8
C <sub>20</sub> H <sub>20</sub> O <sub>2</sub> → C <sub>20</sub> H <sub>16</sub> O <sub>2</sub> + CH <sub>4</sub>	32	17.2
C <sub>20</sub> H <sub>20</sub> O <sub>2</sub> → C <sub>20</sub> H <sub>18</sub> O <sub>2</sub> + H <sub>2</sub>	16	8.6
C <sub>20</sub> H <sub>20</sub> O <sub>2</sub> → C <sub>20</sub> H <sub>16</sub> O <sub>2</sub> + H <sub>2</sub>	16	8.6
C <sub>20</sub> H <sub>20</sub> O <sub>2</sub> → C <sub>20</sub> H <sub>14</sub> O <sub>2</sub> + C <sub>2</sub> H <sub>2</sub>	5	2.7
C <sub>20</sub> H <sub>20</sub> O <sub>2</sub> → C <sub>20</sub> H <sub>14</sub> O <sub>2</sub> + H <sub>2</sub>	2	1
C <sub>20</sub> H <sub>20</sub> O <sub>2</sub> → C <sub>20</sub> H <sub>12</sub> O <sub>2</sub> + H <sub>2</sub>	1	0.5
C <sub>20</sub> H <sub>20</sub> O <sub>2</sub> → C <sub>20</sub> H <sub>10</sub> O <sub>2</sub> + H <sub>2</sub>	1	0.5

ExxonMobil Research and Engineering

### PRD Enables Simulation of Heptene Pyrolysis Under Experimental Conditions of Temperatures

Maximum fuel conversion achieved is about 47.5%

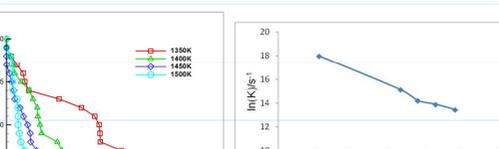

Temperature (K)	No. of Replicas	Simulated time (ns)
1800	10	7.39
1500	80	174.72
1450	80	386.18
1400	120	650.07
1350	180	992.3 = 1µs

Lowering the simulation temperature resulted in

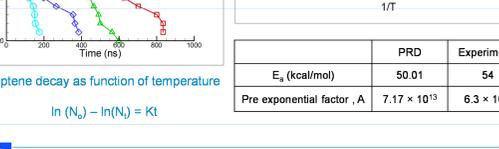

- efficient utilization of more number of replicas and effective acceleration in time without compromising the parallel efficiency
- intermediate radicals survive longer instead of undergoing only fragmentation reactions
- Amount of (C<sub>2</sub>+C<sub>1</sub>) products formed progressively decreased with T, in accordance with shock tube experiments<sup>6</sup> performed at 900 to 1300K, and 25-50 atm

ExxonMobil Research and Engineering

### Estimation of Apparent Kinetic Parameters from PRD Simulations

Heptene decay as function of temperature  
 $\ln(N_0) - \ln(N_t) = kt$

	PRD	Experiment <sup>7</sup>
E <sub>a</sub> (kcal/mol)	50.01	54
Pre exponential factor, A	7.17 × 10 <sup>13</sup>	6.3 × 10 <sup>11</sup>

Blades A.T., Sandhu H.S. (1971) Int. J. Kin., 3:187-193

ExxonMobil Research and Engineering

### Conclusions

- We have successfully implemented connectivity-based event detector in LAMMPS to perform reactive PRD simulations using ReaxFF reactive force field method.
- For heptene pyrolysis, our calculations indicate that the probability distribution function for the first two phases follows first order kinetics and hence thermal decomposition of heptene (any olefin and paraffin at low density) can be studied using PRD.
- PRD simulations of heptene pyrolysis indicate that
  - Timescales up to microseconds can be achieved
  - Pyrolysis simulations can be performed at much lower temperatures that were previously inaccessible in MD simulations.
  - Lowering simulation temperatures significantly improves the product distribution and overall chemistry description and enables a qualitative comparison with experiments
  - PRD simulations also enable estimation of kinetic parameters at temperatures that are much closer to experiments
  - PRD efficiency is strongly dependent on "infrequent event" assumption
